A REPRINT  
OF THE LAST (1830) EDINBURGH AND LONDON EDITION  
OF CHAMBERS'S ENCYCLOPÆDIA,

*With Copious Additions by American Editors.*

---

FIFTEEN VOLUMES,  
VOLUME I.

---

NEW YORK:  
AMERICAN BOOK EXCHANGE,  
764 BROADWAY  
1881

## AMERICAN PUBLISHER'S NOTICE.

---

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1830; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA**. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

---

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

## PREFACE TO FIRST EDITION.

---

It is now considerably more than a hundred years since EPHRAIM CHAMBERS gave to the world his *Cyclopædia, or Universal Dictionary of Knowledge*—the prototype, as it proved to be, of a number of similar works, in Britain as well as in other countries, which must have contributed in no small measure to increase the sum of general intelligence. In nearly all these works there has been a tendency to depart from the plan of their celebrated original, as concerns some of the great departments of science, literature, and history; these being usually presented, not under a variety of specific heads, as they commonly occur to our minds when information is required, but aggregated in large and formal treatises, such as would in themselves form books of considerable bulk. By such a course it is manifest that the serviceableness of an Encyclopædia as a dictionary for reference is greatly impaired, whatever may be the advantages which on other points are gained.

With a view to bring back the Encyclopædia to its original purpose of a *Dictionary of Knowledge*, even down to matters of familiar conversation, the Germans formed the plan of their *Conversations-Lexicon*, a work which, extending to a long series of volumes, has passed through ten editions, and obtained a world-wide celebrity. Believing that a translation of the latest edition of that well-conceived and laboriously executed work would be generally acceptable, the Editors made an arrangement for that purpose with the proprietor, Mr. Brockhaus, of Leipsic. After some time, however, had been spent in translating, the task of adapting the information to English requirements was found so difficult, that the resolution was taken to bring out a substantially new work, following in its construction the admirable plan of the *Conversations-Lexicon*, but making use of its valuable matter only so far as it might be found suitable.

CHAMBERS'S ENCYCLOPÆDIA, therefore, although constructed on the basis of the latest edition of the *Conversations-Lexicon*, is, in no part, a mere translation of that work. All that specially relates to Great Britain and her colonies, as well as to the states of North and South America, is collected from new and more direct sources. The articles also on the physical sciences and practical arts receive greater prominence than in the German work, and are nearly all original, being mostly the work of contributors having special knowledge of the subjects. Even in the articles of the *Conversations-Lexicon* relating to Germany and other continental countries, as well as to subjects of a universal interest, the lapse of time (now ten years) since the publication of that work began, as well as the difference in the relative importance of the same subject in different countries, has rendered great alterations necessary in order to adapt the information to the present time and to Great Britain. The employment of illustrative engravings and maps is another feature in which the present work differs from the German.

The general character of the work, now thus far advanced, is indicated by its title—*A Dictionary of Universal Knowledge for the People*. The several topics are not handled with a view to the technical instruction of those who have to make a special study of particular branches of knowledge or art. The information given may be characterized as *non-professional*, embracing those points of the several subjects which every intelligent man or woman may have occasion to speak or think about. At the same time, every effort is made that the statements, so far as they go, shall be precise and scientifically accurate. One great aim in the arrangement of the work has been to render it *easy of consultation*. It is expressly a Dictionary, in one alphabet, as distinguished on the one

hand from a collection of exhaustive treatises, and, on the other, from a set of Dictionaries of special branches of knowledge. To save the necessity of wading through a long treatise in order to find, perhaps, a single fact, the various masses of systematic knowledge have been broken down, as it were, to as great a degree as is consistent with the separate explanation of the several fragments. In the greater number of articles, however, there will be found copious references to other heads with which they stand in natural connection; and thus, while a single fact is readily found, its relation to other facts is not lost sight of. It will be observed that by means of accentuation some assistance is given in the pronouncing of the proper names which form the heads of the articles. At the conclusion of the work it is intended to give a copious General Index, referring to subjects casually noticed—an arrangement which cannot fail to be of considerable use to those who wish to consult the work on many matters of interest.

EDINBURGH, *March 31, 1860.*

W. & R. CHAMBERS.

### PREFACE TO REVISED EDITION OF 1874.

EVER since the completion of CHAMBERS'S ENCYCLOPÆDIA in 1868, alterations have been made from time to time in the successive reprints of sheets, so as to meet the more important changes taking place. But within the last eighteen months the whole of the articles have undergone thorough revision, and have been brought up to the present time; not a few of them having been entirely re-written. The present re-issue is thus virtually a *New Edition*, and will, it is hoped, be found to represent the actual state of things. It is proper to add that the revision has been effected under the careful superintendence of ANDREW FINDLATER, LL.D., who has throughout taken charge of the work, and imparted to it that practically useful character which has rendered it so universally acceptable.

EDINBURGH, *November, 1874.*

W. & R. CHAMBERS.

### CONTINUED REVISION.

THE process of revising CHAMBERS'S ENCYCLOPÆDIA is *constantly carried on*, thus keeping up the information to the latest possible date.

## CONCLUDING NOTICE.

---

THE design of this work, as explained in the Notice prefixed to the first volume, is that of a DICTIONARY OF UNIVERSAL KNOWLEDGE FOR THE PEOPLE—not a mere collection of elaborate treatises in alphabetic order, but a work to be readily consulted as a DICTIONARY on every subject on which people generally require some distinct information—no article being longer than is absolutely necessary. Commenced in 1859, the work is now brought to a close in 1868, and the Editors confidently point to the Ten volumes of which it is composed, as forming the most COMPREHENSIVE—as it certainly is the CHEAPEST—ENCYCLOPÆDIA ever issued in the United Kingdom.

The original plan, as exemplified in the first volume, has been strictly adhered to throughout: and if, as the work proceeded, there has been any change in the method or quality of the execution, it may at least be affirmed that the change has not been for the worse. After some experience, it became easier to find the person specially qualified to write a particular kind of article, and thus the circle of contributors became widened, and the distribution of the work more specialized. It was also seen to be desirable, in regard to certain classes of subjects, to admit a rather ampler selection of heads. This has been effected without increasing the scale of the work, not so much by less full treatment of the subjects, as by increased care in condensing the statements and omitting everything superfluous.

It will be observed that in the earlier volumes there are fewer notices of *places* than in the later. These and other deficiencies in the Geographical department have, as far as possible, been remedied in the SUPPLEMENT; so that the ENCYCLOPÆDIA forms a complete Gazetteer. The minuteness of a special geographical dictionary is, of course, not to be expected: with regard to towns, for instance, it may be well to state, in order to prevent disappointment, that, as a rule, no place with a population under 3000 in the United Kingdom, or under 5000 in other parts of the world, need be looked for under its own name, unless it be historically or otherwise noteworthy. But towns, rivers, etc., of secondary importance mentioned anywhere in the work find a place in the Index, and thus a clue is given to some information regarding them, were it only their whereabouts on the map.

In like manner, in the department of Biography, the limited scale of the work made it necessary to exclude many names which would be deserving of record in an exhaustive biographical dictionary. The intention has been to include only the more prominent actors and thinkers, dead and living, especially such as have attained extensive celebrity. The difficulty of making such a selection is known only to those who have tried it; and the Editors were prepared to have the judiciousness of their choice frequently questioned. In settling relative claims to distinction, the judgment depends much on the special pursuits or sphere of thought of the judge. Of the omitted names to which attention has been kindly called by correspondents, several have, on reconsideration, been introduced into the SUPPLEMENT.

Natural History has been copiously treated. Without any attempt at embracing a complete exhibition of the three kingdoms of nature, the aim has been to give some account of every class of objects having a general interest, more especially such as are in any way of use in the economy of life.

The articles descriptive of the structure and functions of the human body have been selected and treated mainly with a view to illustrate the laws of health. The subject

of Health and Disease has received more attention relatively than is usual in such works, and the articles of this class will form a pretty complete Dictionary of Domestic Medicine. How important it is that some knowledge on these matters should be widely diffused, is becoming more and more recognized. The directions given in regard to treatment are chiefly meant for those cases of sudden illness or injury where lay practice is necessitated by the absence of professional assistance. But prevention is better than cure, and the chief advantage of a generally diffused knowledge of the nature and causes of diseases is that it teaches people how to avoid them. A review of what has been done in recent years for the preservation of the health of communities is given at some length in the SUPPLEMENT, under the head of SANITARY SCIENCE.

Of the Sciences, the least adapted to encyclopedic treatment is Mathematics. All forms of common occurrence, however, have been introduced, and a brief exposition of the subjects given, as far as could be done in an elementary way.

Natural Philosophy has received ample attention, and all the leading doctrines and facts of general interest will be found under their appropriate heads, treated in a popular way and divested as far as possible of the technicalities of mathematics.

Chemistry, some knowledge of which is becoming daily more indispensable in all departments of life, receives a comparatively large space. Prominence has been given to those points of the subject that have either a direct practical bearing or a special scientific interest. During the progress of the work, several changes in the nomenclature and notation of the science have come into general use; but it was thought better to preserve uniformity in the use of terms and symbols to the end, and to give an account of the changes in the SUPPLEMENT.

A distinctive feature of this ENCYCLOPÆDIA, it is believed, will be found to lie in the number of articles devoted to religious beliefs and speculative opinions, and in the way in which these topics are handled. The principle followed has been, not to pronounce an opinion for or against a particular doctrine, but to give a true and unprejudiced account of it. To do this, however, in regard to matters of still living controversy, on which almost every one has more or less of a personal feeling, is next to impossible; and, therefore, the plan has been adopted of giving the opposing views, wherever it was practicable, as stated by their respective adherents. Thus, the articles on the doctrines and rites of the Roman Catholic Church are written by a Roman Catholic scholar; the Unitarian scheme of doctrine by a Unitarian; and the Secularists have been allowed to state their own case. In carrying out this principle, it has sometimes been necessary to employ two writers on one article. The account of the REFORMATION, for instance, is naturally written by a Protestant; but our conception of the movement is not complete until we know how the same events are looked upon by intelligent adherents of the Church of Rome, and, accordingly, a paragraph is added written from the Roman Catholic point of view. Similarly, in the article BISHOP, the Episcopal and Presbyterian theories of the origin and nature of that office are from different pens. The principle of getting an account of a system or doctrine from a believer in it has not been confined to religion; it has been acted on in regard to HOMŒOPATHY, HYDROPATHY, and many other subjects. The Editors feel confident that in thus securing the most favorable representation of both sides of a controversy, they were doing the best in their power for the ultimate prevalence of the truth. We are not in a position to judge rightly between two opinions until we know exactly what they are; and this we can do only by having both before us in the light in which they appear to those that hold them.

The great world of thought of the East, with its hundreds of millions of subtle intellects and prolific imaginations, has remained hitherto almost a sealed book in the West, except to a few oriental scholars. Yet the British public might be expected to feel some interest in inquiring what kind of thoughts and fancies actuate the vast multitudes of their fellow-subjects in Hindustan—what gods they worship, and with what rites; what things seem good to them, and what evil; how, in short, they interpret the riddle of this world, and the part they play in it. The means of gratifying this curiosity is now made more generally accessible than it has heretofore been, by the numerous articles, drawn from original sources, on the religious and philosophic systems of India. (See the articles INDIA, section on *Religion*; PURÂN'A, VEDA,

VISHNU, VEDĀNTA, TRANSMIGRATION, BUDDHISM, LAMAISM, NIRVĀNA; etc.) Attention is also called to the original articles on Mohammedanism, and on its various schools, sects, and heresies (see MOHAMMEDANISM, KORAN, SUNNA, SHIITES, and others in the ENCYCLOPÆDIA proper, and particularly the articles MOHAMMEDAN SECTS, MOTAZALITES, ISMAILIS, SINCERE BRETHREN, etc., in the SUPPLEMENT). The reader who has been accustomed to think of the Old Testament Scriptures as the whole of Hebrew literature, will be able, from the articles on the TALMUD, HAGGADA, HALACHA, ESSENES, and others, to form some notion of the rich treasures of Jewish thought and learning that lie buried in the Talmudic writings and have only recently begun to attract attention.

True to its projected plan as a DICTIONARY OF UNIVERSAL KNOWLEDGE FOR THE PEOPLE, CHAMBERS'S ENCYCLOPÆDIA will be found to be especially rich in notices of miscellaneous matters. Some of the subjects introduced might perhaps be considered beneath the dignity of a book aspiring to a more severely scientific character; but all of them are, if not instructive, at least curious or entertaining, and likely to occur in the course of reading or conversation. During the progress of the work, the Editors have received numerous assurances from parents how highly it was prized, even though only partly issued, in households with young people at school, as a repertory of the kind of things they are constantly in search of and often puzzling their elders about. This use of the ENCYCLOPÆDIA has been steadily kept in view; and it is gratifying to learn that it is found efficiently to serve the purpose intended. The numerous wood-cuts and maps will, it is hoped, enhance its value in this respect.

To meet the more important of the changes that have taken place since the publication of the ENCYCLOPÆDIA began, as well as to remedy some deficiencies, a SUPPLEMENT of 409 pages has been added. It consists of: (1) Subjects that have only recently risen into importance, or that had been overlooked; (2) Subjects already noticed in the body of the work, but which have since undergone important changes, or, from other causes, seemed to require to be treated anew.

In the introductory Notice, it was stated that the plan of the work was contrived with a special view to render it *easy of consultation*. This end will be still further served by the INDEX of subordinate subjects at the end of this volume. Prefixed to the Index is a paragraph explaining its nature and use.

That in a work extending to 8320 pages, and consisting of upwards of 27,000 distinct articles, in the production of which more than a hundred writers have taken greater or less part—that in such a work, notwithstanding all vigilance to the contrary, there should be not a few oversights, errors, and inconsistencies, is a matter of course. Yet, in spite of such inevitable blemishes, the Editors feel confident that, in substantial accuracy and trustworthiness, this ENCYCLOPÆDIA will bear comparison with any book of the kind. To the numerous correspondents who have favored them by pointing out faults, or making other suggestions, they beg leave, once for all, to return their best thanks for the uniform courtesy with which their criticisms have been offered. Some of the complaints of omission have been attended to in the SUPPLEMENT; others proceeded on mistaken ideas as to what the ENCYCLOPÆDIA was intended for.

A list of the chief Contributors is given on a subsequent page. To this able staff, to whose special knowledge of their subjects the ENCYCLOPÆDIA owes its chief value, the Editors have to express their acknowledgments, and to thank them for the patience with which they have submitted to the limits as to space and other trammels incident to the nature of the publication, which often rendered the satisfactory treatment of their subjects extremely difficult. The list does not include the numerous friends to whom the Editors are indebted for single contributions on local or other matters coming within their personal knowledge.

Finally, it is right that the public should recognize in ANDREW FINDLATER, LL.D., the ACTING EDITOR, who has borne the great burden of the immediate superintendence of this work during its progress from beginning to end. Where a man of learning has given ten years of his life to a task which confessedly he has performed with skill, taste, and unflagging perseverance, it seems to the Editors that, in simple justice to him, his name should be made honorably and gratefully known.

EDINBURGH, April, 1868.

W. & R. CHAMBERS.

# LIBRARY OF UNIVERSAL KNOWLEDGE.

## A

**A** is the first letter in almost all alphabets; the only exceptions, perhaps, are the Ethiopian, where it stands thirteenth, and the Runic, in which the order is altogether different (see RUNES). It has in English at least four distinct sounds, as heard in *ale*, *man*, *father*, *all*. Of these, the third may be considered its primitive and proper sound; it is its name-sound in perhaps all languages except English, and is that which is assigned to it in comparative grammar. This sound is the purest and fullest in human speech; it is that which the child learns first and most easily to produce, and its sign stands as if by right at the head of the alphabet. In the oldest languages it is the predominating vowel, and gives them their peculiar fullness and strength. Philologists consider it the *heaviest* of the three fundamental vowels; the other two, *i* and *u* (whose primitive and proper sounds are heard in *me* and *do*), seem to have arisen out of *a*, by lightening or weakening it (Lat. *cadence*—incidence, *calco*—inculco). By combining with these, *a* gives rise to *ai*, *au*, which in their turn coalesce into *e* and *o*.—In the Phœnician alphabet, the letter A bears the name of *aleph*; i.e., ‘ox,’ with reference to its most ancient form, which rudely represented an ox’s head. From this came the Greek name *alpha*. For engraving or tracing on stone or other hard materials, characters composed of straight lines are best adapted, and such was naturally the earliest form of A and the other letters. It is easy to trace the growth of our small a or a out of the monumental A. In Greek and Roman inscriptions executed hastily or carelessly, the form

 is often found; and this, written with a flexible reed, became rounded into 

—For A and the other letters as abbreviations, see ABBREVIATIONS.

A, as a note in music, is the major sixth of the scale of C major. When perfectly in tune to C, it stands in the proportion of  $\frac{3}{2}$  of 1. But in this state it would not be a fifth to D, the second note of the scale of C, being a comma too flat, which difference is as 80 to 81. The ear being sensibly offended with this deficiency, the note A is therefore made the least degree higher than perfect—namely,  $\frac{9}{8}$ , by which the advantage is gained, that A is a fifth above D ( $\frac{10}{9}$ ), or only deficient in the proportion of  $\frac{1}{16}$ —a deficiency so trifling that the ear accepts the fifth, D, A. and the sixth, C, A, as perfect, although, mathematically calculated, the one is too great and the other too small.—For A major and A minor, see KEY.

**A 1**, a symbol by which first-class vessels are known in Lloyd’s register of British and foreign shipping (q.v.), and by which the operations of shippers of goods and insurers are governed. Surveyors appointed by the society examine all vessels in course of building, with a view to ascertaining their character, and inscribing them accordingly in the register. A designates the character of the hull of the vessel; the figure 1, the efficient state of her anchors, cables, and stores; when these are insufficient, in quantity or quality, the figure 2 is used. The character A is assigned to a new ship for a certain number of years, varying from four to fifteen, according to the material and mode of building, but on condition of the vessel being statedly surveyed, to see that the efficiency is maintained. A vessel built under a roof is allowed an additional year on that account. An additional period of one year, and, in certain cases, of two years, is also allowed to vessels whose decks, outside planking, etc., are fastened in a specified way. After the original period has elapsed, the character A may be “continued” or “restored” for a time (1–8 years), on condition of certain specified repairs.—When a vessel has passed the age for the character A, but is still found fit for conveying perishable goods to all parts of the world, it is registered A in red. (The symbol for this class was formerly *Æ* asterisk in red.)—Ships *Æ* in black form the third class, and consist of such as are still found, on survey, fit to carry perishable goods on *shorter voyages*.—Classes E and I comprise ships sufficient to convey goods not liable to sea-damage; the one class for voyages of any length, the other for shorter voyages.

**AA**, the name of a number of rivers and streams in the north of France, Holland, Germany, and Switzerland. As many as forty have been enumerated. The word is said to be of Celtic origin, but it is allied to the old German *aha*, Gothic *ahva*, identical with the Latin *agua*, "water." Ach or Aach is another form of the same word. Four streams of the name of Ach fall into the lake of Constance. The word, in both forms, occurs as final syllable in many names of places, as Fulda (formerly Fuldaha), Biberach, Biberich, etc. In the plural it is Aachen (waters, springs), which is the German name of Aix-la-Chapelle (q.v.). Aix, the French name of so many places connected with springs, is derived from Latin *Agua*, which became in old French *Aigues*, and then Aix. Compare the Celtic Esk, Ex, Axe, Ouse.

**AA**, **CHRISTIAN KAREL HENDRIK, VAN DER**, 1718-93; b. at Zwolle, Holland; a celebrated scholar and clergyman, author of works on natural science. His grandson, **CHRISTIAN PIETER ROBIDE**, 1791-1851, b. Amsterdam; was a poet of considerable prominence. Another of the same family (presumably), **JAN**, is the author of a *Biographical Dictionary of the Netherlands*.

**AACHEN**. See **AIX-LA-CHAPELLE**, *ante*.

**AA'GESEN, SVEND**, one of the earliest historians of Denmark, who lived in the latter part of the 12th century. His history of that country covers from the 4th to the 12th centuries, both inclusive.

**AALBORG** (Eel-town), a seaport in the north of Jutland, with considerable trade; pop., '70, 11,721.

**AALEN**, a walled town of Würtemberg, on the Kocher, at the foot of the Swabian Alps. In the town are linen and woollen factories, ribbon looms, and tanneries; and near by are extensive iron works. A. was a free city from 1300 to 1863, and then annexed to Würtemberg. Pop., '71, 5552.

**AALI PASHA'**, 1815-71; d. Constantinople. In 1834 he was secretary of legation to Austria; in 1838 in the British legation, and for a time *charge des affaires*. In 1840 he was under-secretary for foreign affairs; 1841 to 1844, ambassador to England; subsequently a member of the Turkish council of state and justice, minister for foreign affairs, and imperial chancellor. He was in the foreign office from 1848 till 1852; then promoted to be field marshal and pasha. About the close of 1852, he was, for a time, grand vizier or prime minister, which position he resigned, and was made governor-general of Smyrna, and afterwards of Brusa. In 1854 he was restored to power as foreign minister; in 1855 he attended the council at Vienna, and was once more made prime minister. He resigned Nov. 1, 1856, but the sultan kept him in the cabinet without official position. In 1858 he was again grand vizier, retired the next year, but returned again. In 1861 the sultan made him once more the head of the cabinet, but in the same year he resigned and accepted the portfolio of foreign affairs. In June, 1867, he was appointed regent of the empire during the sultan's visit to European courts. He bore a prominent part in the London conference of 1870, to settle upon Russia's questions concerning the opening of the Black Sea. He was firm, but moderate, and not only smoothed over many difficulties, but contributed much to the stability and importance of his country. He was of small size and indifferent appearance.

**AALST**. See **AELST**, *ante*.

**AALTEN**, a t. in the Netherlands, on the Aar, 29 m. e. of Arnhem; pop., '67, 6160.

**AAR**, next to the Rhine and Rhone, the largest river in Switzerland, rises in the glaciers near the Grimsel in Berne, forms the falls of Handeck, 200 ft. high, flows through lakes Brienz and Thum, and passing the towns of Interlaken, Thun, Berne, Solothurn, Aarau, Brugg, and Kilngenu, joins the Rhine at the village of Coblenz, in Aargau, after a course of nearly 200 miles. It is a beautiful crystal stream, and, though rapid, is navigable for small-craft from lake Thum. There are several small rivers of the same name in Germany.

**AARAU**, chief t. in the canton of Aarau, at the foot of the Jura mountains, on the right bank of the Aar, 41 m. n.e. from Berne. It is well built; has a town hall, barracks, several small museums, and a library rich in Swiss historical works. There are silk, cotton, leather, and cutlery manufactories, and an iron foundry. The town is famous for producing excellent mathematical instruments. The slopes of the mountains are covered with vines, and the vicinity is very attractive. Pop. 5449. Ten miles away, on the Aar, are the famous baths of Schinznach.

**AARD-VARK**, *Orycteropus capensis*, the Earth-pig; a plantigrade animal, class mammalia, order edentata; native and common in South Africa; resembling a short-legged pig; length, full grown, about 3 ft. 5 in.; head 11 in.; tail 1 ft. 9 in.; ears 6 in. It has a long, thin head, the upper jaw projecting over the lower; mouth small; tongue long, slender, flat, and covered with glutinous saliva to entangle ants. The ears erect and pointed; eyes far up the snout; body thick and fat; limbs short and very strong. The skin is usually bare, but sometimes partially covered with stiff, reddish-brown hair; the tail is bare, thick at the base and sharp at the end. It is very timid, and hastens to burrow in the ground upon the least alarm. It feeds entirely on ants, going at dark

to their hills and running its long tongue into a passage-way; the frightened ants are stuck in the saliva and devoured. The flesh is tolerable for food, and the hind quarters are sometimes smoked or salted and eaten.

**AARD-WOLF**, *Prates Lalandii vicierna cristata*, the Earth-wolf; a quadruped of the digitigrade carnivorous mammalia; native of South Africa; looks like a cross between the fox and hyena, and is about the size of a full-grown fox, but standing higher on its legs; ears larger and less hairy, tail not so bushy. It is striped, and might be mistaken for the hyena, from which it differs chiefly in a more pointed head, and a fifth toe on the fore foot. Its fur is ash-colored and woolly, and it has a coarse mane from head to tail, which is elevated when the animal is enraged, like the hair on a cat's back. Its muzzle is black and nearly naked; legs and feet dark brown in front and gray behind; ears dark brown outside and gray inside. It goes abroad only in the night, and then for food. It is fond of its kind, and a number will live in a single burrow. Being very timid, it is not easily caught, running rapidly despite its short hind legs.

**AARGAU** (ARGOVIE), a canton of Switzerland, on the lower course of the Aar, and having the Rhine for its n. boundary. Its surface is diversified with hills and valleys, is well wooded, and generally fertile. The area is about 530 sq.m., and the population in 1877 was 202,048, rather more than half being Protestants. Besides agriculture, considerable manufacturing industry in cotton and silk is carried on both in the towns and country, and the prosperity of the population has of late markedly increased. In this canton is the castle of Habsburg or Hapsburg, the original seat of the imperial family of Austria. The chief town is Aarau, situated on the Aar; pop., '70, 5449.

**AARHUUS**, a seaport on the e. coast of Jutland, and seat of a bishop; pop., '70, 15,025.

**AARIFI PASHA'**, a Turkish statesman, appointed minister of foreign affairs in 1877, having been minister of education, and also of justice, and twice envoy to Austria. He is one of the best scholars in Turkey, familiar with the principal languages of Europe, and has won a place in literature by translating *The History of the Crusades* from the French.

**AARON**, the elder brother of Moses, was appointed his assistant and spokesman, and at the giving of the Mosaic law received for himself and his descendants the hereditary dignity of the priesthood. Aaron assisted his brother in the administration of public affairs. He died in the 123d year of his age, on mount Hor, on the borders of Idumea. His third son, Eleazar, succeeded him in the office of high-priest.

**AARON OF ALEXANDRIA**, the earliest writer on diseases who mentions the small-pox. He wrote in the 7th century.

**AARSENS, FRANCIS VAN**, 1572-1641; one of the greatest diplomatists of the United Provinces. He represented the States General at the French court many years, and was in diplomatic service in Venice, Germany, and England. Richelieu, with whom he had negotiations in 1624, ranked him as one of the three greatest politicians of the time. There is a stain on his memory because of his complicity in the death of Barneveldt, who was executed in 1619, by order of the States General, after a trial which was scarcely more than a mockery.

**AASEN, IVAN ANDREAS**, b. 1813; a Norwegian philologist. He is the son of a farmer; educated by his own exertions; studied botany, but turned his attention to the native dialects. In 1848 he published *Det norske Folkesprogs Grammatik*, and in 1850 added *Ordbog over det norske Folkesprog*, and still later a work on Norwegian proverbs. He was granted an annuity some years ago.

**AASVÄR**, islands off Norway, about lat. 66°, an important centre of herring fishery, in which more than 10,000 men are employed in December and January; but for the rest of the year the islands are almost deserted. The fish is the great Nordland herring, and the catch often reaches 200,000 tons in a season.

**AB**, the fifth month of the ancient Jewish year, now the eleventh (and in intercalary years the twelfth), in consequence of the transfer of new year from spring to autumn. On the first day of Ab there is a feast to commemorate the death of Aaron, and on the ninth the most solemn of all Hebrew feasts, to mark the destruction of the first temple by Nebuchadnezzar, 558 B.C., and the second temple by Titus, 70 A.D. Ab may begin as early as July 10, or as late August 7.

**ABAB'DE, ABABDEH, or ABABDIE**, an African people occupying the region between the Nile and the Red Sea, south of Kossier, and near the latitude of Dara, or Derr. They are distinct from Arabs, though they intermarry, and accept the religion of the Koran. As a rule they are faithless and treacherous. They have few horses, but fine breeds of camels and dromedaries. There are three tribes, numbering in all about 120,000. Some are agriculturists, but the great part are nomadic. They have considerable possessions, and a small trade in senna and charcoal, which they send to Cairo.

**AB'ACA, or MANILLA HEMP**, is the fibre of a species of plantain or banana, *Musa troglodytarum*, a native of the Philippine isles, where it is extensively cultivated. The leaf-stalks are split into long stripes, and the fibrous part is then separated from the fleshy pulp. A laborer can in this way produce daily 50 lbs. of hemp. Before 1825, the quantity produced was insignificant, but now it amounts to nearly 31,000 tons annually. In

Manilla there is a steam rope-work for making ropes of it for naval purposes. They are very durable, but not very flexible. The fibre of a number of species of *Musa* is used in tropical countries. See PLANTAIN.

AB'ACO, or LUCA'YA, the largest of the Bahama islands, 80 m. long by about 15 m. wide, 150 m. e. of Florida, lat. 26° 30', long. 76° 57'. Pop. 2000. Ship-building, wrecking, and turtle-fishing are the chief employments.

AB'ACUS, an instrument seldom seen except in infant-schools, where it is used to make the elementary operations of arithmetic palpable. It consists of a frame with a number of parallel wires, on which beads or counters are strung. In ancient times, it was used in practical reckoning, and is said to be so still in China and elsewhere.—*Abacus Pythagoricus* meant the multiplication-table.—ABACUS, in arch., is a square or oblong level tablet on the capital of a column, and supporting the entablature. In the Doric, old Ionic, and Tuscan orders, the abacus is a regular oblong; but in the new Ionic, Corinthian, and Roman orders, the abacus has concave sides, with truncated angles. Square marble tablets let into walls, and fields with figures in them inserted in mosaic floors, were also included under the term abacus in ancient architecture.

ABAD' (allied both in etymology and meaning to the Eng. *abode*), an affix to names of Persian origin, as *Hyderabad*, the "dwelling" or city of Hyder.

ABAD' I. (ABU AMRU IBN HABED), the first Moorish king of Seville, and founder of the Abadite dynasty. His ancestors were from Syria, but he was born near the Guadalquivir, and brought up in Seville, where by generosity and hospitality he became so popular that the people, in 1015, elected him king. He ruled 26 years, and added Cordova to his dominions.

ABAD' II. (MOHAMMED IBN HABED), 1012-69; son of A. I. He enlarged his father's dominions by adding Andalusia. He is said to have been cruel and relentless.

ABAD' III. (MOHAMMED IBN HABED), 1039-95; son of A. II., a lover and patron of letters and writer of poetry. He was tolerant and kind, and peaceably added a part of Portugal to his kingdom. His chief opponent, Alfonso VI. of Castile, married A.'s daughter, and the alliance roused the jealousy of the smaller Moorish princes, who engaged the king of Morocco in a league by which A. and Alfonso were defeated. Seville was spared from sack by A.'s prompt surrender. He was kept four years a prisoner in Morocco, and his daughters were compelled to spin wool for subsistence. A.'s verses, written while in captivity, are admired. He was the last of the Abadies.

ABAD'DON. See APOLLYON, *ante*.

ABAISSÉ (lowered), a term used in heraldry. When the fesse or any other armorial figure is depressed, or situated below the centre of the shield, it is said to be *abaissé*. *Adossé* (back to back), *affronté* or *confronté* (facing or fronting one another), *aiguissé* (sharpened at the point), *allé* (winged), are other heraldic terms borrowed, like *abaissé*, from the French, and used by English heralds in senses not differing essentially from their ordinary significations in that language.

ABAKA KHAN, d. 1280; the second Mongol king of Persia, of the family of Genghis Khan. He completed the conquests begun by his father, and consolidated the Mongol rule over western Asia.

ABAKANSK', a fortified t. in Siberia, on the Abakan, near its junction with the Yenisei, 54° n. 91° 14' e. Pop. 1000. The town is in the mildest and most salubrious district in Siberia, and is noted for the great number of tumuli in the neighborhood, and for statues of men, some of them nine ft. high, and covered with hieroglyphics.

AB'ANA, and PHARPAR, "rivers of Damascus" (ii. Kings v. 12); probably the present Barada and Awaj, the former flowing through Damascus, and the other passing 8 m. to the south. Both rivers are lost in the marshes on the border of the Arabian desert. The plain of Damascus owes much of its fertility to the irrigation of these rivers.

ABANCAY', a t. in Peru, 65 m. w.s.w. of Cuzco, on the Abancay, over which is one of the finest bridges in South America. The town has extensive sugar refineries; sugar and hemp are cultivated, and silver is found in the mountains.

ABANCOURT, CHARLES XAVIER JOSEPH D', 1758-92, a French statesman. When the revolution of 1789 broke out he was captain of cavalry, but Louis XVI. made him minister of war. In 1793 he was imprisoned by the revolutionary tribunal as a foe to freedom; but while on the way from Orleans to Paris the transport was mobbed and he and his fellow-prisoners were butchered.

ABANDON, Abandoning, Abandonment. This term, in its different grammatical and etymological forms, has various applications in legal phraseology, but all more or less corresponding to its popular meaning. The following are examples:

ABANDONING AN ACTION is a technical expression in Scotch legal procedure, signifying the act by which a plaintiff—or "pursuer," as he is called in Scotland—abandons or withdraws from his action on the payment of the costs incurred, and with the approval of the judge before whom the action had previously been conducted. The same purpose is effected in England by the plaintiff in a court of common law either entering a *nolle prosequi*, or at the trial *withdrawing the record*. In the courts of equity, the plaintiff

may move the *dismissal* of his own bill, or the defendant may move to dismiss the suit for want of prosecution by the plaintiff. Suits may also *abate* by the death or supervening incapacity of the parties. See ACTION.

ABANDONMENT, in marine insurance, signifies the relinquishment to the insurer or underwriter of goods or property saved from a shipwreck, and of all interest in the same, previous to the owners' demanding payment in terms of the policy. See INSURANCE.

ABANDONMENT OF RAILWAYS. By the act of parliament 13 and 14 Vict. c. 83, facilities are afforded for the A. of railways and the dissolution of railway companies by consent of the holders of three fifths of the shares or stock, and by warrant of the "Commissioners of Railways," or, as it now is by the 14 and 15 Vict. c. 64, by warrant of the Board of Trade, who, in this respect, as well as in other matters regarding the regulation of railways, having superseded the former body. See RAILWAY.

ABANDONING or deserting seamen, by masters of merchant-vessels, is, by 9 Geo. IV. c. 81, s. 30, a misdemeanor, and punishable by imprisonment. See SEAMEN.

ABANO, PIETRO D', an Italian philosopher, 1250-1316; educated in Constantinople and Paris; professor of medicine in Padua; wrote on philosophy and medicine, and, like other learned men of his time, practised astrology, by reason of which he was accused of magic, and sentenced to be burnt; but he died in prison.

ABARBANEL. See ABRAYANEL, *ante*.

ABARCA, JOAQUIN, a Spanish bishop, b. about 1780, d. 1844. For supporting the absolute rule of Ferdinand VII. he was made bishop of Leon; but he went with Don Carlos to Portugal and England, acting as his agent, though finally losing the pretender's regard. Banished from Spain, he sought a monastery at Lanzi, where he died.

AB'ARIM, a range of mountains in the land of Moab, e. of the Jordan and facing Jericho. The highest point was Mt. Nebo, the place where Moses closed his earthly career.

AB'ARIS, a Scythian priest of Apollo, to whom it was fabled the god gave a golden arrow on which to ride through the air. This dart rendered him invisible, and it cured diseases and gave oracles. A. gave the arrow to Pythagoras.

ABASCAL', JOSÉ FERNANDO, 1743-1821; a Spanish statesman and general; entered the army in 1762; governor of Cuba in 1796; viceroy of Peru from 1804 to 1816, and in the last year made a marquis. He was noted for administrative ability, firmness, and moderation.

ABATEMENT. This is a term used in various senses in the law of England, as follows: 1. A. of *freehold*, where a stranger without right enters and gets possession. See FREEHOLD. 2. A. of *nuisances*, which is a remedy against injury by nuisance. See NUISANCE. 3. *Plea in A.*, by means of which a defendant, on some formal and technical ground, seeks to abate or quash the action. See ACTION. 4. A. of *legacies and debts*, where the estate is insufficient for payment in full. See LEGACY. 5. A. by the death of parties to actions at law and suits in equity, which are in consequence stopped till revived. The marriage of a plaintiff, the change or loss of interest and right, and other similar considerations, have also the effect of abating legal proceedings. See ACTION. 6. A. or discount in commercial law. See MERCANTILE LAW. 7. A. or deduction of duties levied by the custom-house. See CUSTOMS DUTIES.

ABATEMENT, in Heraldry, is a mark placed over a portion of the paternal coat-of-arms of a family, significative of some base or ungentleman-like act on the part of the bearer. The coat is then said to be abated, or lowered in dignity. Guillim gives nine such marks, all of which are of either one or the other of the two disgraceful colors, tanné (tawney) and sanguine. Such are the delf tanné, assigned to him who revokes his challenge; the escutcheon reversed sanguine, proper to him who offends the chastity of virgin, wife, or widow, or flies from his sovereign's banner; the point-dexter tanné, due to him who overmuch boasteth himself of his martial acts; and the like. Marks of abatement are generally repudiated by the best heraldic authorities. Menestrier calls them *sottises anglaises*, and Montagu is of opinion that we shall seek in vain for a more appropriate designation. Abatements are carefully to be distinguished from such subtractive alterations in coats-of-arms as signify juniority of birth, or removal from the principal house or senior branch of the family. These are commonly called marks of cadency, distinctions, differences, or brisures. The latter term is generally applied to marks of bastardy, which might with less impropriety be classed with abatements.

ABATI, or DELL' ABBATO, NICCOLO, 1512-71; a fresco-painter of Modena. He assisted Primaticcio in decorating the palace of Fontainebleau. A.'s work has been highly praised by Lanzi, Algarotti, and others. One of his finest pieces in oil is the "Martyrdom of St. Peter and St. Paul," now in the Dresden gallery.

ABATTIS, a species of intrenchment, and one of the oldest. It consists of trees felled (*abattu*), and laid side by side, with the branches directed towards the enemy, the softer twigs being cut off. It thus forms a breastwork to fire over, and is very useful in field-works and in the outworks of regular fortifications, for retarding the enemy's advance.

**ABATTOIR** (Fr. *abattre*, to fell or destroy), a slaughter-house. The use of this term has passed into England from France, where the example was first given of public establishments for the slaughter of animals used as food, on such a scale and with such sanitary arrangements as to obviate the injurious effects that are found to result from the existence of private slaughter-houses in the midst of a crowded population. This great public improvement originated with Napoleon, who passed a decree in 1807 for the erection of public *abattoirs*. The extensive works connected with this design were nearly completed before the fall of the Empire; but it was not till the close of 1818 that the Parisian butchers ceased to slaughter in their private establishments. There are now five of these *abattoirs* in Paris—three on the right and two on the left bank of the Seine, containing 240 slaughter-houses in all—which, both in architectural propriety and completeness of internal arrangement, may be regarded as models of their kind. The charge per head is, for an ox six fr. a cow 4 fr., a calf 2 fr., and a sheep 50 centimes. Of the appearance and management of one of the great Parisian *abattoirs*, a good account is given by Sir Francis Head in his amusing work, *A Faggot of French Sticks*. Other towns in France have similar *abattoirs*; and so have Mantua and Brussels.

The erection of similar establishments in Britain is of comparatively recent date. Public slaughter-houses formed part of the plan in the establishment of the new cattle-market in the metropolis in Copenhagen fields. Those built are well arranged, and such of the old slaughter-houses as remain are placed under sanitary inspection. The increased use of country-killed meat obviates the necessity for further *abattoirs*. In Edinburgh an excellent A. was erected by the town-council in 1851.

**ABATTUTA** (Ital.), in music, in strict or measured time.

**ABA'UJVAR**, a county or district in Upper Hungary; 1117 sq.m.; pop., 66,195.

**ABAUZIT, FIRMIN**, a French savant, was born at Uzès, in Languedoc, 1679, and died at Geneva 1767. His parents were Protestant, and at the revocation of the Edict of Nantes, being only six years of age, he escaped with difficulty, by his mother's contrivance, from the hands of the authorities, who wished to educate him into Catholicism, and was sent to Geneva. Here he prosecuted his studies with such intense ardor and diligence, that he became versed in almost all the sciences. He travelled in England and Holland in 1698, where he made the acquaintance of Newton, Bayle, and other eminent writers. Newton, in sending him one of his controversial works, paid him the distinguished compliment of saying: "You are worthy to decide between Leibnitz and me." King William wished to retain him permanently in England, and to that end made him several advantageous offers; but his affection for his mother induced him to return to Geneva. He translated the New Testament into French in 1726, and for his lucid investigations into the ancient history of Geneva he received from its authorities the rights of citizenship. He likewise wrote numerous theological and archaeological treatises, besides leaving one or two scientific and artistic dissertations in manuscript, but the greater portion of these were burned by his heirs, who were Catholics. His orthodoxy has been disputed. From some of his works we gain the impression that he was a Unitarian. His personal qualities secured him universal esteem. Rousseau, who could not bear to praise a contemporary, penned his solitary panegyric on A.

**ABBADIE, ANTOINE and ARNOULD-MICHEL D'**, two brothers, French travelers, known for their researches in Abyssinia, from 1837 to 1845. According to their own account, their objects were purely ethnological and geographical; but they were regarded by certain English travelers and missionaries as agents employed by the French government for religious and political purposes; amongst the results of their travels are a catalogue of Ethiopian MSS., an Ethiopian version of the *Pastor of Hermas*, and the now completed *Géodesie de l'Éthiopie*. The English expedition to Abyssinia led Arnould d'A. to publish, in 1868, his *Douze Ans dans la Haute-Éthiopie*. Arnould has also distinguished himself by his study of the Basque language.

**ABBADIE, JACQUES, D.D.**, 1658-1727; a French Protestant divine; b. in Berne, d. in London. Of poor descent, he was educated by his friends, and advanced so rapidly that at 17 he was granted the degree of doctor of theology. He spent several years in Berlin as minister of the French Protestant church, and in 1690 accompanied Marshal Schomberg to England, becoming minister of the French church in London. He was strongly attached to the cause of William III., who made him dean of Killaloe. He wrote a defense of the English revolution, and an account of the assassination plot of 1693, the material for which he got from the state secretaries. He was able and eloquent, but is known chiefly by his works on the truth of Christianity and the divinity of Christ.

**ABBANDONAMENTÉ** (Ital.), in music, with self-abandonment; despondingly.

**ABBAS**, the uncle of Mohammed, the Arabian prophet, and the chief promoter of his religion (d. 652), was the founder of the family of the **ABBASIDES**, who ruled as caliphs of Bagdad from 749 to 1258, and afterwards exercised the spiritual functions of the caliphate in Egypt, under the protection of mamlukes, till 1517, when that dignity passed to the Turkish sultan. Descendants of this family still live in Turkey and India.—The **ABBASIDES** in Persia were descended from the race of the *Sofi*, who ascribed their origin to the caliph Ali. This race acquired dominion in 1500, and became extinct in

1736. Among them, Abbas I., surnamed the great, was the most eminent ruler. He came to the throne 1586, and died 1628. His reign was marked by a series of victories over the Turks. In alliance with England, he destroyed, in 1621, the Portuguese colony at Ormuz.

ABBAS I., a renowned monarch of Persia, was the youngest son of shah Mohammed Khodabendah. He made a successful rebellion against his father; caused one or more of his brothers to be murdered, and took possession of the throne when but 18 years old, in 1585. He went against the predatory Uzbeks, who plundered Khorasan, defeating them in 1595 in a great battle near Herat, and driving them out of his domains. He was in almost continuous war with the Turks, over whom he gained many important successes, adding territory to his dominions. By a victory at Bassorah, in 1605, he extended his empire beyond the Euphrates, and Achmed I. was forced to cede Shirwah and Kurdistan. In 1618 he defeated the combined forces of the Turks and Tartars near Sultaneh, and made an advantageous peace. But the Turks soon renewed the war, whereupon, in 1623, Abbas took Bagdad after a year's siege. When he died, in 1629, his empire extended from the Tigris to the Indus. He distinguished himself not only by the successes of his arms and the magnificence of his court, but by many administrative reforms, especially encouraging commerce, to facilitate which he built important highways and bridges. He was tolerant to foreigners, especially Christians, though to his own family he was cruel, causing his eldest son to be killed, and the eyes of his other children to be put out.

ABBASIDES, THE, Caliphs of Bagdad, and the most famous of all the Saracen rulers. They claim to have descended from Abbas, the uncle and adviser of the prophet (566-652 A.D.); and they succeeded the Omniads, who were caliphs of Damascus. The family of Abbas acquired great influence because of their near relationship to the prophet, and Ibrahim, fourth in descent from Abbas, gained several successes over the Omniad armies, but was captured and executed in 747 by caliph Merwan. Ibrahim's brother, Abul-Abbas, whom he had named as his successor, assumed the title of caliph, and by a decisive victory near the river Zab, in 750, entirely overthrew the Omniad dynasty; Merwan was executed, and the house of Abbas was firmly established in the government, though the Spanish possessions were lost by the establishment of the independent caliphate of Cordova. Almansur succeeded Abul-Abbas, and founded Bagdad as the seat of the empire. He fought with success against the Turks and Greeks of Asia Minor; but from this period the rule of the Abbasides was distinguished by the development of liberal arts rather than the extension of territory. The severity of Mohammed's religion was relaxed and the faithful yielded to the seductions of luxury. The caliphs Harun Al-Rashid, 786-809, and Al-Mamun, 813-833, attained world-wide celebrity for gorgeous palaces, vast treasures, and brilliant equipage, in which their splendor contrasted strikingly with the poverty of European sovereigns. Harun is well known as a hero of the Arabian Nights, and Al-Mamun as a patron of literature and science. But with all their splendor the caliphs were tyrants, and their memory is stained with deeds of blood wrought through jealousy or revenge. Within less than a century the domains of the Abbasides suffered dismemberment, and their power rapidly decreased. Rival sovereignties (the Ashlabbites, Edristes, etc.) arose in Africa, and an independent government was instituted in Khorasan in 820, under the Taherites. In the west the Greeks again began to encroach; but the fatal blow came from a despised and almost savage race. The caliphs had long been waging war against the Tartars of Turkestan, and many captives taken in these wars were dispersed over the empire. Attracted by the bravery of these prisoners, and fearing rebellion among the subjects, Motassem (833-842), the founder of Samarah and successful opponent of the Greeks under Theophilus, formed bodyguards of the Turkoman prisoners, who speedily became the real rulers of the Saracen empire. Mota-Wakkel, son of Motassem, was assassinated by them in 861, and the succeeding caliphs were only puppets in their hands. The caliph Radhi, 934-941, was compelled to delegate to Mohammed ben Rayek, under the title of "commander of commanders," the government of the army and other important functions of the caliphate. Province after province proclaimed independence; the rule of the caliphs was narrowed to Bagdad and vicinity, and the house of Abbas lost its power in the east forever when Hulague, prince of the Mongols, set Bagdad on fire, and slew the reigning caliph, Motassem, Feb. 20, 1258. The Abbasides continued to hold the semblance of power in the nominal caliphate of Egypt, and feebly attempted to recover their ancient seat. The last of the A., Mota-Wakkel III., was taken by sultan Selim I., conqueror of Egypt, to Constantinople, and kept there some time as a prisoner. He returned to Egypt, and died in Cairo, in 1538, a pensioner of the Ottoman government, and the last of the Abbasides.

ABBAS-MIRZA, a Persian prince, well known by his wars against Russia, was the son of the shah Feth-Ali, and was born in 1783. Abbas possessed great talents and acquirements, and a love for the manners and culture of the west. When he was yet young, his father made him governor of the province Azerbaijan, where, by the help of English officers, he applied himself to the reform of the army. When Persia, in 1811, influenced by France, declared war against Russia, Abbas was commander-in-chief of the main body of the Persian army, but was unsuccessful. Persia lost, at the peace of Gulistan,

in 1813, its remaining possessions in the Caucasus, and was forced to acknowledge the flag of Russia on the Caspian sea. At the instigation of Abbas, a new war broke out in 1826, between Feth-Ali and Russia. The prince fought a second time with extraordinary bravery at the head of the army, but was again obliged to yield to the superiority of the Russian arms, and to conclude a peace, on Feb. 22, 1828, at Turkmanstchai, by which Persia lost all share in Armenia. In this treaty, Russia had guaranteed to Abbas the succession to the Persian throne, the consequence of which was that he became dependent on Russia, and was obliged to give up his connection with England. When, in 1829, the Russian ambassador at Teheran was murdered in a popular tumult, which he had provoked by imprudence, Abbas went in person to St. Petersburg, to prevent any ill consequences, and to maintain the peace. He was received by the emperor with kindness, and went back to Persia loaded with presents. He died in 1833. His death was a great loss to his country, although he could not have prevented the encroachments of Russia. His eldest son, Mohammed Mirza, mounted the throne in 1834, on the death of Feth-Ali, under the united protection of England and Russia.

**ABBAS PASHA**, 1813-54; grandson of Mehemet Ali, and viceroy of Egypt; active but not distinguished in Mehemet's wars in Syria. After Ibrahim's short reign, he took the throne (in 1848) as hereditary successor, but was a cruel and capricious ruler. He dismissed the Europeans in state service, and frustrated much of Mehemet's good work; but he successfully resisted Turkish attempts to lower the condition and prestige of Egypt, and assisted the Sultan in the Crimean war. It is supposed that he was murdered.

**ABBATE, NICCOLO DELL**, or **NICCOLO ABATI**, was born at Modena in 1509 or 1512, and died at Paris in 1571. He was an able and skilful artist in fresco-painting, and was a follower both of Raphael and Correggio; yet he rather blent the two styles in one than imitated either separately. His influence is traceable in the art which prevailed during the second half of the 16th century. His earlier works are to be seen at Modena; his later ones at Bologna, among which is his "Adoration of the Shepherds," considered his finest; but he is best known by the frescoes which he executed for the castle of Fontainebleau, from the designs of Primaticcio. These, however, with the exception of the tableaux representing the history of Alexander the great, were unfortunately destroyed in 1738, at the barbarous suggestion of an architect who wished to enlarge the building.

**ABBATUC'CI, CHARLES**, son of Jacques Pierre, 1771-96; an officer of artillery, and in 1794 Pichegru's adjutant; made general of brigade for bravery, and afterwards general of division. He died from wounds he received in an engagement with the Austrians at Hünigau, where Moreau erected a monument to his memory.

**ABBATUC'CI, JACQUES PIERRE**, 1726-1812; b. in Corsica; a rival and political opponent of Paoli; but he submitted to his control in the war with the Genoese. He became general in the royal army, but after the capture of Toulon resigned and went to France, where he was promoted to general of division. When the English fleet left Corsica, in 1796, he returned home.

**ABBATUC'CI, JACQUES PIERRE CHARLES**, 1791-1857; nephew of Charles; law officer under the restoration. After the revolution of 1830, he was made presiding judge at Orleans, and sent thence to the Chamber of Deputies. He was a leader of opposition to Guizot's ministry, and conspicuous at reform banquets. In the National Assembly in 1848, he was a vigorous opponent of the social democratic movement. He became a warm supporter of Napoleon III., who made him minister of justice and keeper of the seals. His sons, Charles, Antoine Dominique, and Séverin, were supporters of the Bonapartes.

**ABBÉ**, the French name for an abbot (q.v.), but often used in the general sense of a priest or clergyman. By a concordat between pope Leo X. and Francis I. (1516), the French king had the right to nominate upwards of 200 *abbés commendataires*, who, without having any duty to perform, drew a considerable proportion of the revenues of the convents. The hope of obtaining one of those sinecures led multitudes of young men, many of them of noble birth, to enter the clerical career, who, however, seldom went further than taking the inferior orders (see **ORDERS, HOLY**); and it became customary to call all such aspirants *abbés*—jocularly, *abbés* of St. Hope. They formed a considerable and influential class in society; and an *abbé*, distinguished by a short black or violet-colored frock, and a peculiar style of wearing the hair, was found as friend or ghostly adviser in almost every family of consequence. When a candidate obtained an abbey, he was enjoined to take holy orders; but many procured dispensation, and continued to draw the revenues as secular or lay abbots.

**ABBESS**, the superior of a religious community of women, corresponding in rank and authority to an abbot (q.v.), except in not being allowed to exercise the spiritual functions of the priesthood—such as preaching, confession, etc.

**ABBEVILLE**, a co. in South Carolina, between the Saluda and the Savannah rivers. The soil is good and well cultivated to cotton, corn, wheat, oats, and sweet potatoes. Area, 960 sq.m.; pop., '70, 11,916 white, 20,213 black. The Columbia and Greenville railroad runs through the n. part of the co. Co. seat, Abbeville.

**ABBEVILLE**, a fortified t. of France, in the dep. of Somme, stands on the river Somme, about 12 m. from its mouth, and 90 m. n. by w. of Paris. It is built partly on an island, and partly on the banks of the river; the streets are narrow and ill paved, and the houses built mostly of brick and wood. The building most worthy of notice is the church of St. Wolfran, commenced in the reign of Louis XII., whose façade is a splendid example of the flamboyant style, being pierced by three deep portals, and surmounted by three high gothic towers. The chief manufactures of A. are velvets, serges, cottons, linens, sacking, hosiery, jewelry, soap, glass-wares, glue, paper, etc. It is a station on the Railway du Nord, and is connected by canals with Amiens, Paris, Lille, and Belgium. Vessels of between 150 and 200 tons can sail up the Somme as far as Abbeville. Pop. '76, 19,328.

**ABBEY.** See **MONASTERY**.

**ABBEY** is used in a legal sense in Scotland, and signifies the sanctuary or protection to a debtor against legal process afforded by the A. of Holyrood. This privilege has, of course, its origin in the fact that churches used to be regarded as a sanctuary and shelter for all who sought refuge within their walls. The first instance known of a debtor seeking refuge in Holyrood abbey—that of John Scott, 1531 A.D.—is recorded by George Buchanan. See **SANCTUARY**.

**ABBIA' TE-GRASSO**, a t. of Italy, in the province of Milan, 14 miles w.s.w. from Milan city, on the Canal di Bereguardo. It has silk manufactures. Pop. 5200.

**ABBO CERNUUS**, d. 923; a French monk, who wrote an epic poem describing the siege of Paris by the northmen in 885-87, at which he was present. Guizot published a French translation.

**ABBO FLORIANCENSIS**, or **ABBON OF FLEURY**, b. 945; a French scholar, proficient in sciences, and distinguished in the schools of Paris and Rheims. He spent two years in England, helping archbishop Oswald of York in restoring the monastic system; was made abbot of Fleury in 970; was sent twice to Rome by Robert the wise, and each time ward off a threatened papal interdict. He was killed in 1004 while trying to quell a monkish revolt. He wrote, in epitome, the lives of the Roman pontiffs and some controversial works.

**ABBOT** ("father"). This name, originally given to any aged monk, was afterwards more strictly applied to the superior of a monastery or abbey. Since the 6th c., abbots have belonged to the clerical orders, but at first they were not necessarily priests. After the second Nicene council (787), abbots were empowered to consecrate monks for the lower sacred orders; but they remained in subordination under their diocesan bishops until the 11th c. As abbeys became wealthy, abbots increased in power and influence; many received episcopal titles; and all were ranked as prelates of the church next to the bishops, and had the right of voting in church-councils. Even abbesses contended for the same honors and privileges, but without success. In the 8th and 9th c., abbeys began to come into the hands of laymen, as rewards for military service. In the 10th c. many of the chief abbeys in Christendom were under lay-abbots (*abbates milites*, or *abbat-comites*), while subordinate deans or priors had the spiritual oversight. The members of the royal household received grants of abbeys as their maintenance, and the king kept the richest for himself. Thus, Hugo Capet of France was lay-abbot of St. Denis, near Paris. Sometimes convents of nuns were granted to men, and monasteries to women of rank. These abuses were, in a great measure, reformed during the 10th c. After the reformation of the order of Benedictines, monasteries arose that were dependent upon the mother-monastery of Clugny and without abbots, being presided over by *priors* or *pro-abbates*. Of the orders founded after the 11th c., only some named the superiors of their convents abbots; most, from humility or other cause, used the titles of prior, major, guardian, rector. Abbesses have almost always remained under the jurisdiction of their diocesan bishop; but the abbots of independent or liberated abbeys acknowledged no lord but the pope. In the middle ages, the so-called *abbates mitrati* frequently enjoyed episcopal titles, but only a few had dioceses. Before the period of secularization in Germany, several of the abbots in that country had princely titles and powers. In England there were a considerable number of *mitred abbots* who sat and voted in the house of lords. The election of an abbot belongs, as a rule, to the chapter or assembly of the monks, and is afterwards confirmed by the pope or by the bishop, according as the monastery is independent or under episcopal jurisdiction. But from early times, the pope in Italy has claimed the right of conferring abbeys, and the concordat of 1516 gave that right to the king of France. Non-monastic clergy who possessed monasteries were styled *secular abbots*; while their vicars, who discharged the duties, as well as all abbots who belonged to the monastic order, were styled *regular abbots*. In France, the abuse of appointing secular abbots was carried to a great extent previous to the time of the revolution. (See **ABBÉ**.) Often monasteries themselves chose some powerful person as their secular abbot, with a view of "commending" or committing their abbey to his protection (*abbés commendataires*). In countries which joined in the reformation, the possessions of abbeys were mostly confiscated by the crown; but in Hanover, Brunswick, and Würtemberg, several monasteries and convents were retained as educational

establishments. In the Greek church, the superiors of convents are called *hegumeni* or *mandrites*, and general abbots, *archimandrites*.

ABBOT, BENJAMIN, LL.D., 1763-1849; a New England teacher, who had among his pupils Jared Sparks, Daniel Webster, George Bancroft, Edward Everett, and others who became famous. For nearly 50 years A. was at the head of Phillip's Academy, in Exeter, N. H.

ABBOT, CHARLES. See COLCHESTER, LORD, *ante*.

ABBOT, EZRA, LL.D., b. 1819; son of a farmer; graduated at Bowdoin in 1840; spent five years in teaching in academies. In 1847 settled in Cambridge, Mass., and found employment in the libraries of Harvard college and Boston, pursuing private studies in philology and theology. In 1856 he was appointed assistant librarian in Harvard, with the exclusive duty of classifying and cataloguing the books. He resigned in 1872 to accept the Bussey professorship of New Testament criticism and interpretation in the Cambridge Divinity school. In 1852 he was a member of the American Oriental society, and became its recording secretary; in 1861 a member of the American Academy of Arts and Sciences; in 1871 University Lecturer on the Textual Criticism of the New Testament. Among his works are *New Discussions of the Trinity*, *Literature of the Doctrine of a Future Life*, as an appendix to Rev. W. R. Alger's *Critical History of the Doctrine*. He has edited, with notes or appendixes, Norton's *Statement of the Reasons for not Believing the Doctrines of the Trinitarians*, Lamson's *Church of the First Three Centuries*, and other controversial works; and has contributed to the pronunciation of names in Worcester's Dictionary; and also to the "North American Review," and other periodicals.

ABBOT, FRANCIS ELLINGWOOD, b. Boston, 1836; a graduate of Harvard, and editor of *The Index*, a journal of free religion. He has published papers in the "North American Review," and other periodicals.

ABBOT, GEORGE, an English prelate under the Stuarts—chiefly remarkable for the position he held, and the part he acted, as the opponent of the policy of Laud and a despotic court—was the son of a cloth-manufacturer in Guildford, and was born 1562. After studying at Oxford, he was appointed chaplain to the Earl of Dunbar (1608), with whom he went to Scotland. This appointment was the basis of A.'s subsequent promotion. For a short time he held the see of Lichfield and Coventry, and in 1610 was made archbishop of Canterbury. As a learned and able man, but more especially as a friend of toleration, he gained the esteem of all parties in an age of religious animosities. James I. employed the advice of A. in the most important affairs of state, and the prelate often opposed the arbitrary principles of the king. A.'s intolerance of Arminian doctrines was an exception to his general rule of conduct. His independent and liberal spirit incurred the displeasure of Charles I. A. was employed on the authorized translation of the Bible under James I. His other literary productions are not important. He died at Croydon, 1633, and a monument was erected to his memory in his native town, Guildford. His brother, ROBERT A., bishop of Salisbury (b. 1560—d. 1617), was a learned theologian, and the author of a treatise *De Suprema Potestate Regia* (1616), written to controvert the doctrines of Bellarmine and Suarez.

ABBOTT, GORHAM DUMMER, LL.D., b. Me., 1808; d. Mass., 1874; son of Jacob, and brother of the writers, Jacob and John S. C. He was educated at Bowdoin college; graduated in 1826; passed a short theological course at Andover, graduating in 1831, and was settled as Congregational minister at New Rochelle, N. Y., three years, in which time he wrote works for the American Tract Society. Quitting the pulpit, he established a female seminary in New York city (afterwards the Spingler Institute), and presided over it thirteen years, becoming one of the most skilful and scientific of teachers. He wrote *The Family at Home*, *Nathan Dickerman*, *Mexico and the United States*, *Pleasure and Profit*, and other works.

ABBOT, SAMUEL, 1732-1812; one of the founders of the theological seminary at Andover, Mass., toward which he gave \$20,000 in 1807, and \$100,000 more in his will. He was a successful merchant of Boston and a free donor to worthy charities.

ABBOT OF MISRULE (in Scotland the ABBOT OF UNREASON), the person who was selected to preside over the merry revels at Christmas in the middle ages.

ABBOTSFORD, the seat of Sir Walter Scott, is situated on the south bank of the Tweed, a little above its confluence with the Gala, and about three miles from the town of Melrose. Before it became, in 1811, the property of Sir Walter, the site of the house and grounds of A. formed a small farm known by the name of *Clarty Hole*. The new name was the invention of the poet, who loved thus to connect himself with the days when Melrose abbots passed over the fords of the Tweed. On this spot, a sloping bank overhanging the river, with the Selkirk hills behind, he built at first a small villa, now the western wing of the castle. Afterwards, as his fortune increased, he added the remaining portions of the building, on no uniform plan, but with the desire of combining in it some of the features (and even actual remains) of those ancient works of Scottish architecture which he most venerated. The result was that singularly picturesque and irregular pile, which has been aptly characterized as "a romance in stone and lime."

The present proprietor of A. is the Hon. Joseph Constable Maxwell, son of Lord Herries, who, in 1873, married a great-granddaughter of the novelist, and assumed the name of Scott. A. is visited annually by thousands of people of every nationality.

ABBOTT, AUSTIN, b. Boston, 1831; brother of Benj. V. and co-laborer in the Digests. He has occasionally contributed to light literature, and, with his brothers Benjamin and Lyman, was author of two novels, *Concut Corners* and *Matthew Caraby*.

ABBOTT, BENJAMIN, 1762-96, a notable minister of the Methodist church, a native of Pennsylvania. He traveled and preached in his own and the adjoining states, and assisted greatly in building up the denomination. Though without education, A. was possessed of much natural eloquence.

ABBOTT, BENJAMIN VAUGHAN, b. Boston, 1830; son of Jacob. He was educated in New York, and admitted to the bar in 1851. He has produced many volumes of reports and digests of federal and state laws, and is a member of the national commission to prepare a digest of the laws of the United States.

ABBOTT, CHARLES. See TENTERDEN, LORD.

ABBOTT, EDWARD, b. Roxbury, Mass., 1841; brother of Lyman. He has published religious works, and was for a time one of the editors of *The Congregationalist*, a religious journal published in Boston. He has recently taken orders in the Episcopal Church, and is settled in Cambridge, Mass. He is one of the editors of *The Literary World*.

ABBOTT, JACOB, a native of Maine, U. S., was born in 1803, and graduated at Bowdoin college in 1820. He is a remarkably voluminous writer, and has acquired a large measure of popularity from the simplicity and earnestness of his thought. He has addressed himself principally to the young, and it is perhaps not too much to say that of all works intended for the juvenile mind, his are the best in the English language. So thoughtful an instructor of youth even as Dr. Arnold, speaks in high terms of *The Way to do Good*. Nearly all his books have been repeatedly republished in England, and some have been translated into various European and Asiatic languages. His most popular work is *The Young Christian*. Besides this, he has written *The Franconia Stories*; *Histories of Celebrated Persons*, 30 vols.; *Harper's Story-books*, 36 vols.; etc.

ABBOTT, JOHN STEPHENS CABOT, 1805-77; b. Maine; d. Conn.; brother of Gorham D. He was educated at Bowdoin and Andover; graduated in 1825; traveled in the United States and Europe to study systems of education; was ordained as a Congregational minister in 1830, and settled successively at Worcester and Roxbury and Nantucket, Mass. In 1833 he published his first book, *The Mother at Home*, and soon afterwards *The Child at Home*. About 1844 he devoted himself solely to literary work, and rapidly produced *Kings and Queens*, or *Life in a Palace*; *The French Revolution of 1789*; *History of Napoleon Bonaparte*; *Napoleon at St. Helena*; *History of Napoleon III.*; *History of the Civil War in America*; *Romance of Spanish History*; *History of Frederick the Great*; etc. His books have been widely circulated, and a number of them have been translated into other languages.

ABBOTT, LYMAN, D.D., b. Roxbury, Mass., 1835; brother of Austin. He graduated from New York university in 1853, and went into the practice of law with his brother. Afterwards he studied theology with his uncle, Rev. J. S. C., and was ordained a Congregational minister in 1860, settling as pastor at Terre Haute, Ind., the same year. He was chosen secretary of the American Union Freedmen's Commission, holding the place till 1868. He was pastor of the New England church in New York, 1866 till 1869, when he gave his whole attention to literature. Among his works are: *Results of Emancipation in the United States*; *Jesus of Nazareth: His Life and Teachings*; and *Old Testament Shadows of New Testament Truths*. He edited *Sermons and Morning and Evening Exercises* from Henry Ward Beecher's writings. Later, he was one of the editors of *Harper's Monthly Magazine*, and principal editor of the *Illustrated Christian Weekly* of New York. He is now associated with Rev. Henry Ward Beecher in the editorship of the *Christian Union*, and is preparing and publishing a series of commentaries on the New Testament.

ABBREVIATIONS are contrivances in writing for saving time and space. They are of two kinds, consisting either in the omission of some letters, or words, or in the substitution of some arbitrary sign. In the earliest times, when uncial or lapidary characters were used, abbreviations by omission prevailed, such as we find on the inscriptions on monuments, coins, etc. In these the initial letter is often put instead of the whole word, as M. for Marcus, F. for Filius. It was after the small Greek and Roman letters had been invented by transcribers for facilitating their work, that signs of abbreviation, or characters representing double consonants, syllables, and whole words, came into use. Greek manuscripts abound with such signs, and often only one that has expressly studied Greek palæography can make them out. From the manuscripts they passed into the early printed editions of Greek books, and it is only recently that they have quite disappeared. Among the Romans, signs of abbreviation were called *notæ*, and professed scribes who employed them were *notarii*. To such an extent was the system carried, that L. Annæus Seneca collected and classified 5000 abbreviations. The same practice has prevailed in all languages, but nowhere more than in the rabbinical writings.—The

abbreviations used by the ancient Romans were continued and increased in the middle ages. They occur in inscriptions, manuscripts, and legal documents; and the practice continued in these last long after the invention of printing had made it unnecessary in books. An act of parliament was passed in the reign of George II., forbidding the use of abbreviations in legal documents. Owing to these abbreviations, the deciphering of old writings requires special study and training, and forms a separate science called diplomatics (q.v.), on which numerous treatises have been written. Tassin's *Nouveau Traité de Diplomatique* (6 vols., Par. 1750-65) contains, in the third volume, an exposition of Roman abbreviations. Other works on the subject are—Gatterer's *Abriß der Diplomatik* (2 vols., Gott. 1798); Pertz's *Schrifttafeln* (4 Nos., Hannov. 1846); and Kopp's *Palæographica Critica* (4 vols., Manh. 1817-29).—In ordinary writing and printing few abbreviations are now employed. The sign &, originally an abbreviation for the Lat. *et*, "and," is perhaps the only one of the arbitrary kind still to be met with. It does not stand properly for a word, for it is used in different languages, but for an idea, and is as much a symbol as +. The abbreviations by using the initials of Latin words that are still in use are chiefly confined to titles, dates, and a few phrases; as M.A. (*magister artium*), Master of Arts; A.D. (*anno domini*), in the year of our Lord; e.g. (*exempli gratiâ*), for example. Many are now formed from English words in the same way; as F.G.S., Fellow of the Geological Society; B.C., before Christ.—Most of the sciences and arts have sets of signs of abbreviations, or symbols, peculiar to themselves. These are of great use both for brevity and clearness. See CHEMICAL SYMBOLS, etc.

The following is a list of the more important Abbreviations in general use:

- Abp., Archbishop.  
A.C. (*Ante Christum*), Before Christ.  
A.D. (*Anno Domini*), In the year of our Lord.  
A.H. (*Anno Hegiræ*), In the year of the Hegira.  
A.M. (*Ante Meridiem*), Before noon; (*Anno Mundi*), In the year of the world.  
A.R.A., Associate of the Royal Academy (London).  
A.R.S.A., Associate of the Royal Scottish Academy.  
A.U.C. (*Ab Urbe Condita*), From the building of the city—that is, Rome.  
B.A. or A.B. (*Artium Baccalaureus*), Bachelor of Arts.  
Bart. or Bt., Baronet.  
B.C., Before Christ.  
B.C.L., Bachelor of Civil Law.  
B.D., Bachelor of Divinity.  
B.M., Bachelor of Medicine.  
Bp., Bishop.  
C. (*Centum*), A hundred; chapter: c., century.  
C.A., Chartered Accountant.  
Cantab. (*Cambridge*), Of Cambridge.  
C.B., Companion of the Bath.  
C.E., Civil Engineer.  
cf. or cp., Confer; compare.  
C.M.G., Companion of the Order of St. Michael and St. George.  
Cr., Creditor.  
Crim. Con., Criminal conversation.  
cwt., Hundred-weight.  
D.C.L., Doctor of Civil Law.  
D.D., Doctor of Divinity; *Dono dedit*.  
D.G. (*Dei Gratia*), By the grace of God.  
Do. (Ital. *ditto*, "said"), The said; the same.  
Dr., Doctor, or Debtor.  
D.V. (*Deo Volente*), God willing.  
dwt., Pennyweight.  
e.g., or ex. gr. (*Exempli Gratia*), For example.  
Etc. (*Et cætera*), And the rest; and so on.  
F.B.S., Fellow of the Botanical Society.  
F.D. (*Fidei Defensor*), Defender of the Faith.  
ff., following.  
F.G.S., Fellow of the Geological Society.  
F.L.S., Fellow of the Linnean Society.  
F.M., Field-marshal.  
F.R.A.S., Fellow of the Royal Astronomical or of the Royal Asiatic Society.  
F.R.C.P., Fellow of the Royal College of Physicians.  
F.R.C.S., Fellow of the Royal College of Surgeons. E., of England.  
F.R.G.S., Fellow of the Royal Geographical Society.  
F.R.S., Fellow of the Royal Society. L., London; E., Edinburgh.  
F.R.S.S.A., Fellow of the Royal Scottish Society of Arts.  
F.S.A., Fellow of the Society of Antiquaries. F.S.A.Scot., Do. of Scotland.  
F.S.S., Fellow of the Statistical Society.  
F.Z.S., Fellow of the Zoological Society.

- G.C.B., (Knight) Grand Cross of the Bath.  
 G.C.H., (Knight) Grand Cross of Hanover.  
 G.C.M.G., (Knight) Grand Cross of St. Michael and St. George.  
 Gr., Greek; Lat., Latin; Ital., Italian, etc.  
 H.E.I.C.S., Hon. East India Company's Service.  
 H.M.S., His or Her Majesty's Service, or Ship.  
 H.R.H., His or Her Royal Highness.  
 Ib. or Ibid. (*Ibidem*), In the same place.  
 I.C.TH U.S. ( $\text{I}\chi\theta\upsilon\varsigma$ ), *Iesus Christos, Theon Huios, Soter*—Jesus Christ, the Son of God, the Savior.  
 Id. (*Idem*), The same; (*Idus*), The Ides.  
 i.e. (*Id est*), That is.  
 I.H.S., \* *Iesus Hominum Salvator*, Jesus the Savior of men; *In Idc (Cruce) Salus*, In this (cross) salvation.  
 Incog. (*Incognito*, Ital.), Unknown.  
 I.N.R.I. (*Iesus Nazarenus Rex Iudeorum*), Jesus of Nazareth, king of the Jews.  
 Inst. (*Instante—mensis* understood), Instant, of the present (month); Institute.  
 I.P.D. (*In Præsentia Dominorum*), In presence of the Lords (of Session).  
 J.C. (*Juris Consultus*), Juris-consult.  
 J.P., Justice of the Peace.  
 J.V. (or U.) D. (*Juris Utriusque Doctor*), Doctor both of Civil and of Canon Law.  
 Kal. (*Kalendæ or Kalendis*), the Kalends.  
 K.B., Knight of the Bath.  
 K.C.B., Knight Commander of the Bath.  
 K.C.H., Knight Commander of the Order of Hanover.  
 K.C.M.G., Knight Commander of St. Michael and St. George.  
 K.G., Knight of the Garter.  
 K.H., Knight of Hanover.  
 K.M., Knight of Malta.  
 K.P., Knight of St. Patrick.  
 K.T., Knight of the Thistle.  
 K. τ. λ., *Kai ta leipomena* (*Kai ta leipomena*), same as "Et cætera."  
 Lb. (*libra*), Pound.  
 L.D., Lady Day.  
 LL.B. (*Legum Baccalaureus*), Bachelor of Laws (the plural being denoted by the double L).  
 LL.D. (*Legum Doctor*), Doctor of Laws.  
 L.R.C.S., Licentiate of the Royal College of Surgeons.  
 L.S.A., Licentiate of the Society of Apothecaries.  
 L.S.D. (*Libræ, Solidi, Denarii*), Pounds, shillings, pence.  
 M. (*Mille*), A thousand.  
 M.A. or A.M. (*Artium Magister*), Master of Arts.  
 Mass., Massachusetts; Vt., Vermont; Pa., Pennsylvania; etc. See UNITED STATES.  
 M.D. (*Medicines Doctor*), Doctor of Medicine.  
 M.P., Member of Parliament.  
 M.R.C.S., Member of the Royal College of Surgeons.  
 M.R.I.A., Member of the Royal Irish Academy.  
 MS., Manuscript; MSS., Manuscripts.  
 Mus. D. (*Musice Doctor*), Doctor of Music.  
 M.W.S., Member of the Wernerian Society.  
 N.B. (*Nota bene*), Mark well; observe.  
 Nem. con. (*Nemine contradicente*), or Nem. diss. (*Nemine dissidente*), No one contradicting or dissenting; unanimously.  
 N.P., Notary Public.  
 N.S., New Style.  
 O.S., Old Style.  
 Oxon. (*Oxoniensis*), Of Oxford.  
 oz., Ounce.  
 P., President; professor, etc.  
 P.C., Privy Councillor.  
 P.C.S., Principal Clerk of Session.  
 Per ann. (*Per annum*), By the year.  
 Per cent. (*Per centum*), By the hundred.  
 Ph.D. (*Philosophice Doctor*), Doctor of Philosophy.  
 P.M. (*Post Meridiem*), After noon.  
 P.P., Parish priest.

\* This was originally  $\text{I}\overline{\text{H}}\Sigma$ , the first three Greek letters of the name Jesus; but its origin having been lost sight of, by substituting S for  $\Sigma$ , and then mistaking the Gr. H (*sta*) for Lat. H, a signification was subsequently found out for each letter. The symbol was still further altered by converting the horizontal stroke, which was the usual sign of abbreviation, into a cross, as it now generally appears, IHS.

pp., Pages.  
Pro tem. (*Pro tempore*), For the time.  
Prox. (*Proximo*), In the next (month).  
P.S. (*Post scriptum*), Postscript.  
Q., Query or Question.  
Q.C., Queen's Counsel.  
Q.E.D. (*Quod erat demonstrandum*), Which was to be demonstrated.  
Q.E.F. (*Quod erat faciendum*), Which was to be done.  
Q.S. (*Quantum sufficit*), Enough.  
q.v. (*Quod vide*), Which see.  
R. (*Rex or Regina*), King or Queen.  
R.A., Royal Academician; Royal Artillery.  
R.E., Royal Engineers.  
R.M., Royal Marines.  
R.N., Royal Navy.  
R.S.A., Royal Scottish Academician.  
S., South; saint; seconds.  
Sc., *Scilicet*, same as *viz*.  
S.L., Solicitor at Law.  
S.M. (*Sa Majesté*), His or Her Majesty.  
S.P.Q.R. (*Senatus Populusque Romanus*), The Roman senate and people.  
Sq. (*Sequens*), The following; Sqq., Do. in the plural.  
S.S.C., Solicitor before the Supreme Courts.  
S.T.P. (*Sanctæ Theologie Professor*), Professor of Theology.  
T.C.D., Trinity College, Dublin.  
Ult. (*Ultimo—mense* understood), In the last (month).  
U.P., United Presbyterian.  
U.S., United States; United Service.  
V.D.M. (*Verbi Dei Minister*), Preacher of the Word.  
Viz. (*Videlicet*), To wit; namely.  
W.S., Writer to the Signet.  
Xmas., Christmas. Xtian., Christian, etc.  
Y<sup>e</sup>, Y<sup>t</sup>; The, That. (This use of Y originated in the Anglo-Saxon character *ƿ*, which was equivalent to the modern *th*. In manuscripts, this character degenerates into a form like a black letter *y*, which was retained in these contractions after its origin and real sound had been lost sight of.)

Besides the generally current abbreviations given above, other short methods of statement are frequently employed in particular circumstances. In the present work, for instance, in which the saving of space is of great moment, when the title or heading of a subject recurs in the body of the article, it is generally—especially if a proper name—represented by its initial letter: e.g., A. for Abd-el-Kader. Two dates thus (1215–1250), following the name of a king, a pope, etc., indicate briefly the beginning and end of his reign or term of office; or thus (b. 1215—d. 1250), the dates of his birth and death. The meaning of these and similar contractions is in general sufficiently obvious from the connection in which they stand. See CONTRACTIONS.

ABBREVIATIONS (*ante*). In the United States there are fewer A. used than in England, as there are no titles except the names of offices. But a great variety are peculiar to the country, such as *Hon.* for member of Congress, and indeed almost any one of note; *Esq.*, absurdly written after names in addressing letters. In politics, *Rep.*, *Dem.*, *Con.*, *Rad.*, for Republican, Democratic, Conservative and Radical parties; *H. R.*, for House of Representatives; *Sen.*, for Senate; *U.S.S.Ct.*, for United States Supreme Court, etc. Names of States are almost invariably abbreviated, and the contractions are well known; also *Co.* for county. Military and naval, such as *Maj.*, *Gen.*, *Col.*, *Lt.*, *Admt.*, *Com.*, *Capt.*, are used. In commerce, *C.O.D.*, "collect on delivery," is much used; A 1 denotes ships or anything of the first class; *fancy*, applied to stocks that are not "regular." In money, only the \$ mark and *cts.* are common. Certain trades have their peculiar contractions, such as booksellers, paper-makers and others. In printing, the use of A. depends much upon the nature of the work. If technical, as on chemistry, arithmetic, or astronomy, contractions or peculiar signs are used in profusion, for oxygen and other elements and combinations; for notation, relation, and equality; for sun, moon, planets, and their aspects. In weights and measures the *lb.*, *oz.*, *ft.*, *deg.*, etc., are used. The legal profession has its peculiar contractions. Time is noted in *yr.*, *mo.*, *hr.*, *min.*, and *sec.* Orders in *F. and A.M.*, *I.O. of O.F.*, etc. The church in *Abp.*, *Bp.*, *Dea.*, *Rev.*, *D.D.*; and *M.E.P.*, *Bp.*, *R.C.*, etc.

ABBT, THOMAS, 1738–66; a German author, educated at Halle university, and professor of mathematics at Rinteln. He did much toward the improvement of the language of his country. Of his books the more important are those *On Merit*, and *On Dying for our Native Country*.

ABD signifies in Arabic "slave" or "servant," and enters, along with the name of God, into the composition of many proper names: as Abd-Allah, "servant of God;" Abd-el-

Kader, "servant of the mighty God;" Abd-ul-Latif, "servant of the gracious God," etc. So *Ebed* in Hebrew and Syriac.

**ABDALLAH-BEN-ABD-EL-MOTTALIB**, 545-570; the father of Mohammed. He was an only child, and was about to be sacrificed by his father when another person interfered and persuaded the father to sacrifice a hundred camels instead of the boy. Soon after A. married a daughter of Wahb, a Benu Zahra chief, and of this union came the great prophet.

**ABDALLAH-BEN-AL-AFTAS**, 1004-60; founder of the dynasty of Bence Al-Aftas in Africa. His military talents secured for him the title of "The Victorious."

**ABDALLAH-BEN-YASEEN** lived in the early part of the 11th century, and founded the Almoravides dynasty in Northern Africa. He was a zealous follower of the prophet, and converted pagans by the sword rather than the book. Though holding supreme authority for a long time, he was content with the title of "Theologian." The reign of his successors lasted about a century.

**ABDALLAH-BEN-ZOBAÏR**, b. about 622, d. 692; the first of Mohammed's disciples; son of Zobair, one of the prophet's friends and companions. His mother was a sister of Mohammed's favorite wife. Abdallah opposed Ali, the elected successor and nephew of the prophet, and renewed his struggle for supremacy after Ali's assassination. He seized Mecca, holding it against Yezid, caliph of Damascus. During the siege the temple of the Holy Caaba was destroyed, but Yezid's death saved the city from capture. A. was acknowledged caliph of Mecca, and rebuilt and restored the city by 685. The Damascus caliphs renewed the war, and Mecca was again besieged, but stoutly defended by A. in his seventieth year. Finally Mecca was taken by assault, and A., who retreated within the Caaba, was slain.

**ABDALS**, Persian religious fanatics who deem it meritorious to slay any one of a different faith, and if slain themselves in the attempt are considered martyrs.

**ABDAS**, a saint in the Roman Catholic and Greek churches. He was a bishop in Persia about the beginning of the 5th c. who destroyed a temple of the fire-worshippers, refusing to rebuild it, though commanded by the king to do so. In retaliation A. was killed and all the Christian churches were destroyed, the persecution lasting more than a quarter of a century, and causing a war between Rome and Persia.

**ABD-EL-HALIM**, b. in Cairo, 1826; son of Mehemet Ali; educated in Paris. Before the viceroy of Egypt was recognized by the sultan, Halim was a member of the family council; in 1856 he was governor of Khartoom.

**ABD-EL-HAMID**, the adopted name of DE COURET, a French traveler in the East, who was sent on a mission to Timbuctoo in 1848. Alexander Dumas used his adventures in "The Pilgrimage of Hadji Abd-el-Hamed Bey," 1855.

**ABD-EL-KADER**, properly El-Hadji-Abd-el-Kader-Ulid-Mahiddin, is the descendant of a Marabout family of the race of Haschem, who trace their pedigree to the caliphs of the lineage of Fatima. He was born at Ghetna, an educational institution of the Marabouts near Mascara, which belonged to his family. His father, who died in 1834, being esteemed a very holy man, had exercised great influence over his countrymen, which influence he bequeathed to his son. In his eighth year A. made a pilgrimage to Mecca with his father; and in 1827 he visited Egypt, where, in Cairo and Alexandria, he first came in contact with western civilization. Religious enthusiasm and melancholy were the most prominent features of his character. He early showed an uncommonly gifted mind, and at the chief school of Fez he acquired such knowledge as composes Arabian science. A. was free from the savage cruelty, as well as from the sensuality, of the Arabs; he maintained purity of manners, and did not suffer himself to be misled by anger or passion. Although he firmly adhered to the faith of his nation, and used their fanaticism as one of his most important sources of influence, yet he had no sympathy with the fanatical intolerance of the majority among them. His public career began at the time of the conquest of Algiers by the French. No sooner was the power of the Turks broken, than the Arabian tribes of the province of Oran seized the opportunity to make themselves independent. Having got possession of Mascara, they elected A. as their emir, who soon succeeded in establishing his authority over a number of the neighboring tribes. He now attacked the French; and some bloody battles, fought on Dec. 3, 1833, and Jan. 6, 1834, against Gen. Desmichels, then commanding in Oran, obliged the latter to enter into a treaty with him. In the interior of the country the power of A. now spread in an alarming way. In consequence of victories over neighboring chiefs, he became master of Miliana and Medeah. All the cities and tribes of the provinces of Oran and Titèri acknowledged A. as their sultan; the more distant tribes sent him ambassadors with presents. It was not long before hostilities broke out between him and the French. The commencement was favorable to him, for the first operations of Gen. Trezel led to that fatal retreat, during which the French army was attacked at Makta, on June 28, 1835, by the whole assembled forces of A., amounting to nearly 20,000 cavalry, and suffered a disgraceful defeat.

After a protracted struggle of six years, A. found himself obliged (1841) to take refuge in Marocco. Here he succeeded in getting up a sort of crusade against the enemies of

Islam; and the arms of France were now turned against Morocco for the countenance given to A. After the decisive battle of Isly (1844) the sultan was obliged to give up A.'s cause, but soon found that the latter was at least his equal in power, and that he could not even prevent him from marching out of Nedem to attack the French again, both in Oct. 1845, and in Mar. 1847. But the star of A. was now about to set. In the night of the 11th Dec. he made a bold attack on the Moorish camp, in which he was defeated and had to resolve on flight. He might easily have secured his own safety, but he would not abandon his attached followers, men, women, and children, to the plunder and massacre of the Maroccans. After a heroic combat on the 21st December, he effected their retreat across the Muluia into the territory of Algeria, where they mostly surrendered to the French. He himself, with a few horsemen, resolved to fight his way through to the south; but coming to the Pass of Kerbous, he found the way closed and was received with musketry. Dispirited at length, A. surrendered, on Dec. 22, 1847, to Gen. Lamoricière and the Duc d'Aumale, upon condition that he should be permitted to withdraw either to Egypt or to St. Jean d'Acre. The French government refused to ratify this agreement. A. was sent with his family to Toulon, whence he was removed in 1848 to Pau, and finally to the Château d'Amboise. Liberated in 1853 by Louis Napoleon, he lived at Brussa, in Asia Minor, till its destruction by an earthquake in 1855. He then, for a time, lived in Constantinople, but finally made his home in Damascus. He was of great service to humanity during the Syrian massacres of 1860. In 1865 he visited Paris and England, and was present at the Paris exhibition in 1867. In his retirement he wrote a religious work, a translation of which was published at Paris, 1858, under the title, *Rappel à l'Intelligent: avis à l'Indifférent*.

ABD-EL-WAHÂB'. See WAHABIS, *ante*.

ABDE'RA, a maritime t. of Thrace, e. of the mouth of the Nestus. About 400 B.C. it was a flourishing place. The inhabitants became proverbial for stupidity, though such men as Protagoras, Democritas, and Anaxarchus, the Philosophers, Hecææus, the historian, and Nicænetus, poet, were born there.

**ABDICATION** is the act of giving up an office, generally the office of ruler or sovereign. It is rarely done out of pure preference of a private station, but is generally the result of vexation and disappointment. It was perhaps voluntarily, and from being wearied with dominion, that Diocletian, and along with him Maximian, abdicated (305). Christina of Sweden retired from the throne (1654) out of preference for the freedom of private life, but wished still to exercise the rights of a sovereign. Charles V. laid down the crown (1556) because his great schemes had failed. Philip V. of Spain did so (1724) in a fit of melancholy, but resumed it on the death of his son. Amadeus of Savoy abdicated (1494) to become a priest. Victor Amadeus of Sardinia, who abdicated in 1730, wished to recall the step, but was not allowed. Louis Bonaparte resigned the crown of Holland, because he would not consent to treat that country as a province of France. Charles Emanuel of Sardinia retired from the throne in 1802, not finding himself equal to the crisis; and the same was the case with Victor Emanuel in 1819. William I. of the Netherlands resigned (1840), as his policy had become impossible from the turn of affairs in Belgium. Foreign force compelled the abdication of Augustus of Poland (1707), and later, that of Stanislaus Leszczyński (1735) and of Poniatowski (1795); as well as that of Charles IV. of Spain (1808), and of Napoleon (1814 and 1815). Insurrections have been the most frequent cause of forced abdications. The early history of the Scandinavian kingdoms abounds in instances. In England, the compulsory abdication of Richard II. (1399) is an early example. In the case of James II. it was disputed whether the king had "abdicated" or "deserted." More recent times saw Charles X. (1830) and Louis Philippe (1848) retire before the storm of revolution, without the conditions they made being regarded. The abdication of Ferdinand of Austria (1848) was an indirect consequence of the events of the year of revolutions; that of Charles Albert of Sardinia (1849), of the battle of Novara. Of several cases among German princes, the chief is that of Ludwig of Bavaria (1848). A late instance is that of Amadeus, king of Spain, who felt himself obliged to give up his crown on the 11th of February, 1873.

In some countries, the king can abdicate whenever he pleases; but in England, the constitutional relation between the crown and the nation being of the nature of a contract, the king or queen, it is considered, cannot abdicate without the consent of parliament. It is, however, said that the king does abdicate, or, to speak perhaps more correctly, an A. may be presumed, and acted on by the people, if his conduct politically and overtly is inconsistent with, and subversive of, the system of constitutional government, of which the qualified monarchy of his office forms part.

At the conference between the two houses of parliament previous to the passing of the statute which settled the crown on William III., it would appear that the word "abdicated" with reference to king James II. was advisedly used instead of "deserted"—the meaning, it is presumed, being that king James had not only deserted his office, but that by his acts and deeds, of which the said desertion formed part, he had, in view of the constitution, ceased to have right to the throne. From this it may be inferred that A. was considered to have a twofold political signification, involving maladministration as well as desertion. The Scotch convention, however, more vigorously and distinctly

resolved that king James "had forefaulted [forfeited] the crown, and the throne was become vacant."

ABDIEL, in "Paradise Lost," the faithful angel who opposed the revolt in heaven begun by Satan.

**ABDO'MEN.** The trunk of the human body is divided by the diaphragm into two cavities—the upper being the thorax or chest, and the under, the abdomen or belly. Both the cavity and the viscera it contains are included in the term A. It contains the liver, pancreas, spleen, and kidneys, as well as the stomach, small intestine, and the colon. The lower bowel, the bladder, and internal organs of generation lie in the lowest part of the cavity, which is called the pelvis. The A. is lined by a serous membrane, the peritoneum, which is folded over the viscera, allowing them a certain freedom of motion, but keeping them in their proper relations to each other. The A. is divided externally by two horizontal lines into three principal regions—the upper or epigastric, the middle or umbilical, and the lower or hypogastric. These are again subdivided by two vertical lines—the side-divisions being called the hypochondriac, lumbar, and iliac regions respectively; the names epigastric and umbilical are then applied in a restricted sense to the middle divisions of the two upper principal regions; while the middle division of the lower is called the region of the pubis. Diseases of the abdominal viscera are frequent, and chiefly consist either of chronic disorders of the digestive organs, or of derangements of the nerveplexuses and ganglia there situated. These disorders announce themselves partly in bodily pain, and partly in mental affections, such as hypochondria and hysterics.

ORGANS OF THE ABDOMEN.

1. Diaphragm. 2. Gall-bladder. 3. Pyloric end of Stomach. 4. Right lobe of Liver. 5. Duodenum. 6. Great end of Stomach. 7. Spleen. 8. Piece of Omentum. 9. Pancreas (Sweetbread). 10. Small Intestine (Jejunum). 11. Great Intestine (Colon). 12. Small Intestine (Ilium).

**ABDOMEN**, in Entomology, the last of the three parts into which the body of an insect is divided. It is composed of a number of rings or segments, frequently nine, more or less distinct from each other. It contains a portion of the intestines and the sexual organs. In the perfect insect, its segments bear no legs nor wings; but the hind legs of larvæ or caterpillars, which afterwards disappear, are attached to them. In many insects, its last segments bear appendages of various uses and forms, as pincers, stings, borers or of ovipositors, etc.

**ABDOMINAL'ES**, or abdominal fishes, in the Linnæan arrangement, an order of fishes including all the osseous fishes of which the ventral fins are placed upon and beneath the abdomen, and so behind the pectoral fins. Subsequent naturalists have thought it right in classifying fishes to give a higher place to other characters; and in the system of Cuvier, the name A. is given to an order of much more limited extent, a subdivision of the *malacopterygii* of soft-rayed osseous fishes, distinguished by having the ventral fins placed beneath the abdomen and not attached to the bones of the shoulder. It includes the *cyprinidæ* (carp, minnow, etc.), *esocidæ* (pike, etc), *siluridæ*, *salmonidæ* (trout, salmon, etc.), and *clupeidæ* (herring, etc.).

**ABDUCTION**, in the criminal law of England, signifies the unlawful taking away of the person of a female. Such is the usual limitation of the word; although, under the Jewish law, and subsequently according to the principles of the civil law, the A. or "stealing" of the person was applied to the male sex, as well as to women, coming more nearly to what we now understand by *kidnapping* (q.v.). In the civil law, the offence was called *plagium*, or *crimen plagii*, under which name it still has a place in the Scotch criminal law, and, in practice, is applied to the A. of children of either sex, or of women generally. The A. may be accomplished either by force or by any fraudulent or sinister means; and this latter quality seems more appropriate to the strict meaning of the term, as derived from the Latin verb *abducere*, to lead off, or induce, or persuade away.

This subject will be best explained under the heads to which we have already referred.

1. **ABDUCTION OF CHILD.**—It is provided by the 24 and 25 Vict., c. 100, s. 56, that if any person shall unlawfully, either by force or fraud, lead or take away, or decoy or entice away, or detain any child under the age of fourteen, with intent to deprive the parent, guardian, or other person having the lawful charge of such child, of the possession of such child, or with intent to steal any article on its person; or shall with any such intent as aforesaid receive or harbor such child, knowing the same to have been so stolen or enticed, every such offender shall be guilty of felony, and shall be liable to penal servitude for seven years, or imprisoned, with or without hard labor, for any term not more than two years, and also, if a male, to be whipped, such male being under sixteen. It is also a misdemeanor subject to two years' imprisonment to take or decoy

unlawfully out of the parent or guardian's possession any unmarried girl under the age of sixteen. To steal or unlawfully take or decoy a child under fourteen is felony.

Sir Archibald Alison, in his work on the *Principles of the Criminal Law of Scotland* (p. 280), says: "This [stealing a child] is obviously a crime of the very greatest atrocity, from the unequalled agony and distress which it necessarily inflicts on the unfortunate parents who are in this cruel manner bereaved of their offspring. \* \* \* From the earliest times, accordingly, this atrocious offence has been punished with death by the Scotch law. Nor is it any defence that the child is taken away for affection to itself, or from any other motive, and not for the sake of lucre, taken in its ordinary sense, for the detainer has at least that advantage and benefit which he coveted in taking away the child; and this is sufficient to constitute theft in the estimation of the law." The same principle is recognized by the law of England, which holds that as the offence of A. is positively prohibited, the absence of a corrupt motive will not be a defence to the charge. Further on, in the same work (p. 630), Sir Archibald lays it down that "The wickedly and feloniously enticing or inducing an infant child to leave its parents or guardians without their knowledge or consent is a crime at common law;" and in support of this he refers to a case where the prisoner, who was a teacher of elocution, and was desirous to get a little child to recite poetry to his audience, applied to a girl, an infant of nine years of age, in the Orphan Hospital, and prevailed on her, by promises of fine clothes, and making a lady of her, to leave the hospital, and come to him, where she was soon found after in his custody. This was done at clandestine interviews with the child, and without the knowledge or concurrence of her relations who had placed her in the hospital. The flight of the accused, who was out on bail, prevented any further procedure in the case, beyond his outlawry.

2. ABDUCTION OF WIFE.—Blackstone and Stephen both lay down that this species of A. might be either by fraud and persuasion or open violence; though the law supposed force and constraint in the former case as well as in the latter, the wife having no legal power to consent. The remedy to the husband was an action by which he sought not the possession of his wife, but damages for the A. of her; and by statute 3 Edw. I., c. 13, the offender could be imprisoned two years, and be fined at the pleasure of the crown. Both the crown and the husband might, therefore, have this action. The husband is also entitled to recover damages against such as persuade and entice the wife to live separate from him without a sufficient cause. But, although such was once the existing law of England, it is now antiquated, and is quite unsuited to the present state of society. The remedy for the offence, or rather injury, in question, will be more appropriately found under the statutes passed to amend the law relating to divorce and matrimonial causes, and under which the marriage may be either annulled, with, in the case of the adultery of the wife, damages from the adulterers; or the parties may be "judicially separated."

3. ABDUCTION OF WARD, OR PUPIL.—By the law of England, a guardian was always, and is still, entitled to an action, if his ward or pupil be taken from him; but the proper remedy now is by an application to the court of chancery, which is the supreme guardian of, and has independent jurisdiction over, all the infants in the kingdom. In Scotland, a similar jurisdiction as to the charge and custody of all Scotch pupils is exercised by the court of session.

4. ABDUCTION OF HEIRESS.—The law on this subject is very distinct. The 24 and 25 Vict., c. 100, s. 53, enacts that where any woman shall have interest, present or future, in any real or personal estate, or shall be heiress presumptive, or next of kin, to any one having such interest, if any person shall, from motives of lucre, take away or detain such woman against her will, with intent to marry or defile her, or to cause her to be married or defiled by any other person, every such offender, and every person counseling, aiding, or abetting him, shall be guilty of felony, and subject to penal servitude for fourteen years and not less than three years, or to imprisonment, with or without hard labor, for any term not exceeding two years.

Moreover, by the same statute, it is enacted that if any person shall fraudulently allure or take away such woman, being under the age of twenty-one, out of the possession, and against the will, of her parent or guardian, with intent to marry or defile her, shall be guilty, though without any motives of lucre. And in this, as the preceding case, the offender forfeits all interest in property which would otherwise come to him by the marriage.

It is an offence within the statute to take away from the custody of her putative father a natural child under twenty-one.

By the above statutes the same law is extended to Ireland, without difference in the case of heiresses; and in both the above cases the court of chancery has power to settle the woman's property in a proper manner.

ABDUCTION OF WOMEN GENERALLY.—Not only are heiresses or females having property protected against forcible marriages or against violation, but the same law has been extended also to all women with or without expectations. By the 24 and 25 Vict., c. 96, s. 54, whosoever shall, by force, take away, or detain against her will, any woman of any age, with intent to marry or carnally know her, or to cause her to be married or carnally known by any other person, shall be guilty of felony, and subject to a punish-

ment similar in all respects to the case of heiresses. This enactment, which had existed in Ireland since 1830, was extended to England in 1861.

ABDUCTION OF VOTERS. See VOTERS, ABDUCTION OF, ELECTION, PARLIAMENTARY.

ABD-UL-AZIZ, b. Feb. 9, 1830; d. June 4, 1876; second son of Mahmoud II., and thirty-second sultan of the Turkish empire. In early life he had a fondness for agriculture, and established a model farm. On succeeding his brother Abd-ul-Medjid, June 25, 1861, he gave many promises of reform, and was thought to be brave and patriotic. He began by reducing his own civil list to \$3,000,000, and dismissing his brother's seraglio. But his reforms achieved nothing, and dissatisfaction at home and abroad became intense. In 1867 he made a tour of Europe, visiting the Paris exhibition and several capitals, in which he spent a vast amount of money to little purpose. The knowledge of better civilization determined him to do something practical, and in 1868 he changed the formation of the council of state, which he wished to make the central government for the empire. To his new council of thirty-four Mohammedans and sixteen Christians he promised more reform and an attempt to assimilate with western civilization; but the war in Candia took his attention, and a war with Greece was probable. The Greek difficulty was arranged by a conference at Paris, and the sultan turned his attention to Egypt, where the Khedive, Ismail Pasha, contemplated casting off Turkish allegiance; but instead of rebelling Ismail visited Constantinople to effect an arrangement. Learning the sultan's financial embarrassment, he got important concessions, among them a new law of succession for his house, and nearly all the prerogatives of an independent sovereign. The sultan's affairs grew desperate; one ministry followed another at short intervals, and Ignatieff, the Russian ambassador became all-powerful with the distressed ruler. When the revenues were so low as barely to pay interest on the public debt, a revolt began in Herzegovina, and soon spread over all Bosnia. With an empty treasury, the sultan could not properly meet this rebellion, and the *softas* (theological students) demanded his abdication; the council of ministers determined upon his removal, and made his nephew, Murad V., his successor. A few days after his deposition (June 4, 1876), Abd-ul was found dead in his apartments. A jury of physicians decided that he died from severing the arteries of his arms, and it was believed that he committed suicide. He had five recognized children: Yusef, who he meant should be his successor; Sultana Salikhe, Mahmoud Jemil, Mehmed Selim, and Abd-ul-Medjid.

ABD-UL-HAMID II., b. Sept. 22, 1842; Sultan of Turkey; second son and fourth child of Abd-ul-Medjid; succeeded his brother, Murad V., Aug. 31, 1876. He was with Murad and his uncle (Abd-ul-Aziz) at the Paris exhibition, 1867. His early life was inconspicuous, but he had a liking for European manners, and a strong taste for geography, making a vast collection of maps, military and statistical. When he came to the throne he had a wife and two children brought up with him at the table, his home-life having been free and familiar. He is ranked as an old or orthodox Turk; though not extreme, yet a strong opponent of the young Turkish party, and is an abler man, physically and mentally, than the brother he succeeded. He is the thirty-fifth in male descent of the house of Othman, the founder of the empire, and the twenty-eighth sultan since the conquest of Constantinople.

ABD-UL KERIM PASHA', b. 1807; in 1877 commander-in-chief of the armies of Turkey. His military education was obtained in Vienna, where he also mastered the German tongue. His promotion in the army was rapid, and he served in all the wars of his country in recent times. His successful campaign in Servia in 1876 secured to him the position of commander-in-chief; but on account of inactivity in opposing the advance of the Russians he lost favor and was removed. He is resolutely opposed to Christians, intractable to superiors, but much loved by soldiers.

ABD-UL-LATIF, a celebrated Arabian writer of multifarious acquirements, was born at Bagdad in 1161. During his youth he underwent an amazing amount of mental drudgery, in accordance with the eastern fashion of his time, in order to fit himself for becoming a scholar. The ordeal consisted in his committing to memory a large number of standard works, such as the Koran, the novels of Hairri, and not a few grammatical treatises. To complete his culture in the various branches of Mohammedan lore, he betook himself to Damascus; where the famous Saladin had gathered round him the most learned men of the time. Through the liberality of the sultan, and the kindness of the vizir Fadhel, he was enabled to proceed to Egypt, where he delivered lectures while Saladin was fighting the Lion-heart at St. Jean d'Acre. Here he became intimate with Moses Maimonides, the great Jewish writer. He now devoted himself chiefly to the study of medicine, although, while at Cairo, he also wrote his excellent and accurate work on Egypt, which was translated into Latin by professor White of Oxford in 1800, and into French by baron de Sacy in 1810. He died at Bagdad in 1231, on his way to Mecca, in the 70th year of his age.

ABD-UL-MEDJID-KHAN, the grand sultan, was born on the 23d April, 1823, and succeeded his father, Mahmoud II., July 1, 1839. The Turkish empire was then in a very dangerous position. The army had been defeated and dispersed by the Egyptians in the battle of Nisib (June 29, 1839), and there was nothing to hinder the victorious Ibrahim Pasha from advancing on Constantinople, where a large party were favorable to the

Egyptian power. This party wished to make the viceroy of Egypt, Mehemet Ali, chakan (the ancient title of the grand sultan) of both seas. He was the only man, they maintained, capable of upholding the banner of Islam against the unbelievers both within and without. Had it not been for the intervention of the Christian powers, the house of Osman was lost. The treaty of July, 1840, from which France kept aloof, rescued the young Padishah from sure destruction. Mehemet Ali had to submit (Nov. 27, 1840); and the treaty of July, 1841, to which France subsequently adhered, settled the future dependent relation of Egypt to Turkey. The sultan, though not very energetic in body or mind, proceeded in the path of reform begun by Selim III. and Mahmoud II. In this he had for his chief adviser Reshid Pasha, an intelligent and humane mussulman, educated in France. The aim of all his measures was to place the Osman population on a footing with the civilized inhabitants of the west. A. wished the happiness of all his subjects, without respect to creed. A sort of proclamation of their rights was issued in the hatt-i-sharif of Nov., 1839. This was followed by numerous reforms in all departments; and in 1850 the professors of all religions were decreed equal in the eye of the law. That these decrees remained, in a great measure, a dead letter, is not attributable to the will of the sultan. The chivalrous part acted by A. (1850) in refusing, at the risk of losing his throne, to give up Kossuth and the other political refugees to the menaces of Russia and Austria, will make his name remembered in the annals of humanity.

The sovereigns of Turkey have long been in an anomalous position. The ambassadors of the great powers have ruled the divan; and the sultan had a specially difficult part to play during the war with Russia (1854-56), and the diplomatic negotiations consequent to it. A. was the thirty-first sovereign of the race of Osman. On the death of A. in 1861, his brother, Abdul-Aziz (b. 1830), succeeded him; but when Abdul-Aziz was deposed in May, 1876, A.'s eldest son, Mohammed Murad (b. 1840), became sultan for a few months, and then made way in August for the second son, Abdul-Hamid.

**ABD-UR-RAHMAN**, Sultan of Fez and Morocco, b. 1778, was the rightful heir to the throne when his father died, 1794; but was superseded by an uncle, after whose death he ascended the throne 1823. His first four years of rule were occupied in quelling insurrections. Next, some danger to the state of Morocco was threatened by the refusal of Austria to pay the tribute for safety against pirates; but the sultan wisely adjusted the dispute by relinquishing this sort of "black-mail," formerly levied by Morocco on European ships in the Mediterranean. The religious war under Abd-el-Kader against the French in Algeria involved the sultan in its movements; but was concluded by the battle of Isly, 1844, and the subsequent mediation of England. The piratical habits of his subjects brought A. to the brink of war with more than one European state. The sultan was a zealous mussulman, without the wild fanaticism common among his countrymen; as a ruler, he was strict, and often cruel. He was succeeded in 1859 by his eldest son, Sidi-Mohammed (b. 1803—d. 1873).

**ABD-UR-RAHMAN**, or **ABD-ER-RAHMAN**, I., b. in Damascus, 731—d. 787, the first of the Omiades family in Spain. After the massacre of his family, he hid himself in Mauritania, until called by his friends to establish order in Spain. He landed in Andalusia in 755, and soon had a large army with which he entered Seville, where he was acknowledged sovereign. He defeated a larger army under the most powerful of the emirs, and firmly seated himself on the throne at Cordova. The eastern caliphs sent two fruitless expeditions against him. He planned and built the magnificent mosque in Cordova, on which it is said he worked an hour a day as a common laborer; and he planted the palm tree from which all the palms in Spain are descended.

**ABD-UR-RAHMAN**, or **ABD-ER-RAHMAN**, III., called "The Defender of the Religion of God," was the first caliph of Cordova, ruling from 912 to 961 A.D., when he died, aged 73. In his time the Mohammedan rule in Spain reached its greatest power and splendor. His own palace was of wonderful magnificence, having an audience chamber furnished with images of gold of the finest workmanship, and a roof covered with the same metal. A. was not only a great ruler, but a liberal patron of literature and art.

**ABECEDARIANS**, a sect of German anabaptists, followers of Storck, a disciple of Luther. They believed it was best not to know how to read, since the holy spirit would convey knowledge of the scriptures directly to the understanding.

**A'BECK'ET**, **GILBERT ABBOTT**, b. London, 1810; d. Boulogne, 1856; an English humorous writer; at an early age he wrote burlesque dramas. He was correspondent and contributor for several journals, particularly *Punch* and *Figaro* in London. His principal works are: *Comic Blackstone*, *Comic History of England*, *Comic History of Rome*, *The Quizziology of the British Drama*, and many articles in *Punch*. In 1849 he was a police magistrate, in which office he displayed remarkable ability. His widow was granted a pension of £100 a year.

**A'BECK'ET**, **THOMAS**. See **BECKET**, *ante*.

**ABEEL**, **DAVID**, D.D., b. New Brunswick, N. J., 1804; d. Albany, N. Y., 1846; many years a missionary in eastern Asia, and an enthusiastic advocate of missions to the heathen. In England he assisted in forming the society for promoting the education of

women in the east. He published his life and travels, and *The Claims of the World to the Gospel*.

A'BEGG, JULIUS FRIEDRICH HEINRICH, German jurist; 1796-1868; he lectured on law at Königsberg in 1826; was professor of law at Breslau, and delegate of the legal faculty to the Prussian national synod in 1846. A. was an influential writer upon criminal administration.

ABEL appears in the book of Genesis as the second son of Adam, and a shepherd. He was slain by his elder brother Cain, under the influence of jealousy, because the offering of the latter had been rejected by Jehovah, and that of the former accepted. It is not said in Genesis why Jehovah accepted the sacrifice of Abel; but the Savior, in the New Testament, speaks of "righteous Abel," from which it is concluded that there dwelt in him a spirit of faith or trust in the unseen God, of which his brother was destitute. The writer of the epistle to the Hebrews opens his enumeration of the "faithful" in the 11th chapter of Hebrews, with these words: "By faith Abel offered unto God a more excellent sacrifice than Cain." Such, also, has been in all ages the universal opinion of the Christian church, which has regarded Abel as a type of innocence and faith.

ABEL, CHARLES FREDERICK, a native of Koethen, in Germany, b. in 1719, was a distinguished musician. He was a pupil of Sebastian Bach, and for some years a member of the famous Dresden band of the elector of Saxony, king of Poland. In 1758, when nearly forty years of age, he came to England in a state of great destitution; but his talents were quickly recognized. He was appointed chamber-musician to the queen of George III. His peculiar instrument, the *viola da gamba*, a small violoncello, with six strings, was never played by any one in equal perfection. He also obtained considerable reputation as a composer, though his pieces are not now held in very great estimation. He died in 1787, having shortened his life by his intemperate habits.

A'BEL, NIELS HENRIK, 1802-29; a Norwegian mathematician. For so short a life the extent and thoroughness of his mathematical investigations and analyses are marvelous. His powers were shown in a remarkable degree in his development of the theory of elliptic functions. Legendre's eulogy, "What a head that young Norwegian has," is the more forcible, because the French mathematician had occupied most of his lifetime with those functions. Abel's works were published by the Swedish government in 1839.

ABEL DE PUJOL, ADRIENNE MARIE LOUISE GRANDPIERRE DEVERZY, wife of Alexandre, and his pupil before marriage. She made her first appearance as a painter in 1836 with a work representing an artist's studio, and painted portraits, and a scene from *Gil Blas*.

ABEL DE PUJOL, ALEXANDRE DENIS, 1785-1861; a French painter; a pupil of David, and a historical painter of the older classical school. Most of his work is in French churches.

AB'ELARD, Fr. *Abélard* or *Abailard*; Lat. *Abelardus*, PETER, a scholastic philosopher and theologian, the boldest thinker of the 12th c., was b. near Nantes, in 1079, at Palet, a village which belonged to his parents. An irrepressible thirst for knowledge, and a special pleasure in scholastic logic, moved him to resign his rights of primogeniture in favor of his younger brothers. He left Bretagne for Paris, in order to hear the prelections of William of Champeaux, but soon incurred the hatred of his master, whom he puzzled by his wonderful subtlety. He fled to Melun, and afterwards to Corbeil, persecuted and admired wherever he went. He then returned home for the restoration of his health. With renewed strength, he returned to Paris, reconciled himself with his opponents, and moulded, by his influence as a lecturer, some of the most distinguished men of his age, amongst whom were the future pope Celestine II.; Peter Lombard; Berengar, his future apologist; and Arnold of Brescia. At this time, there lived in Paris, Heloise, the niece of the canon Fulbert, then seventeen years of age, and already remarkable for her beauty, talents, and knowledge. She soon kindled in the breast of A., then thirty-eight years old, a violent and overwhelming passion, which was returned by Heloise with no less fervor. By means of Fulbert, A. became teacher and companion of Heloise, and the lovers were happy together until A.'s ardent poetical effusions reached the ears of the canon. He sought to separate the lovers; but it was too late. They fled together to the country, where Heloise bore a son, and was privately married to A., with the consent of her uncle. Not long after, Heloise returned to Fulbert's house, and denied the marriage, that her love might be no hindrance to A.'s advancement in the church. Enraged at this, and at a second flight which she took with her lover, Fulbert, in order to make him canonically incapable of ecclesiastical preferment, caused A. to be emasculated. In deep humiliation, A. entered as a monk the abbey of St. Denis, and induced Heloise to take the veil at Argenteuil. But the lectures which he began to give soon after exposed him to new persecutions. The synod of Soissons (1121) declared his opinions on the Trinity to be heretical. He left St. Denis, and built at Nogent-on-the-Seine a chapel and hermitage called Paraclete, which, after being enlarged by his scholars to a monastic foundation, he, on his appointment as abbot of St.-Gildas-de-Ruys, in Bretagne, gave over to Heloise and her sister-

hood for a dwelling. His residence in St. Gildas was embittered by a continued struggle against his love, and by the hatred of the monks; till at last, in 1140, his doctrine was condemned by pope Innocent III., and he was ordered to be imprisoned. But Peter the venerable, abbot of Clugny, after A. had retracted his opinions on the Trinity and redemption, reconciled him to his enemies. A. died with the reputation of a model of monastic propriety, on April 21, 1142, in the abbey of St. Marcel, not far from Chalons-on-the-Saône. Heloise had him interred at the Paraclete, hoping one day to lie by his side. She survived A. twenty years. The ashes of both were taken to Paris in 1808, and in 1828 were buried in one sepulchre in Père la Chaise.—The doctrines advanced by A. in his controversy with St. Bernhard have a decidedly rationalist tendency; and he, and his predecessor Erigena, may be looked upon as the first avowed representatives of that school. A. laid down the principle that nothing is to be believed but what has been first understood; while the church held that we must believe in order to understand; and Bernhard was for banishing inquiry altogether from the province of religion. In judging of A.'s merits, we are not to look so much to his writings as to the influence which his wonderful power of public disputation enabled him to exercise on his age. His character, no less than his doctrine, gave great offence. Until recently, it is chiefly the romantic history of his love that has occupied attention. The chief biographies that have appeared are that by Rémusat (2 v., Par. 1845), and that by Wilkens (Gött. 1855). The Latin writings and letters of A. and Heloise were collected by Amboise, and published by Duchesne (Par. 1616). Some works of A. have been recently discovered; among others, *Sic et Non*, a collection of doctrinal contradictions from the Fathers. Cousin, who published the hitherto unedited works in 1836, has given us a complete edition of A.'s works (2 v., Par. 1849-59).

**ABELE.** See POPLAR.

**ABELITES**, a Christian sect of the 4th c., found chiefly in the neighborhood of Hippo, in North Africa. Their chief distinction consisted in marrying but abstaining from matrimonial intercourse, in order not to propagate original sin. They held that Abel so lived, because the Bible mentions no children of his.

**ABELMOSCHUS.** See HIBISCUS.

**ABEN.** See BEN, *ante*.

**ABENAKUIS**, or **ABNAKIS**, Algonquin Indians, once occupying Maine; the Canabis, or Abenakis, on the Kennebec; the Etechenims towards the St. John; the Pennacooks of the Merrimack; and probably the Sokokes further west. The A. were friendly with the French, and assisted them in various conflicts and frays during the Canadian wars. Their best known leader was Father Râle, a Jesuit missionary; but he was killed and the tribe nearly destroyed at Norridgewock in 1724. A large portion of the A. went to Canada. The descendants of those who remained in New England are the Penobscots and the Passamaquoddys. During our revolution the A. Indians were generally on the side of the colonies. Father Râle mastered their language, and made a dictionary of it. See ALGONQUINS, *ante*.

**ABENCERRAGES**, a noble Moorish race whose struggles with the family of the Zegris, and tragical destruction in the royal palace of the Alhambra, in Granada, in the time of Abu-Hassan (1466-84), the last but one of the kings of Granada, furnish the materials for a charming Spanish work of fiction, *Historia de las Guerras Civiles de Granada* (Madrid, 1694). From this Chateaubriand composed *Les Aventures du Dernier Abencerrage*, and furnished the text of an opera of Cherubini's. The work, however, seems to be destitute of historical foundation; at least Conde is perfectly silent on the subject in his *Historia de la Dominacion de los Arabes en España* (3 v., Madrid, 1829).

**ABENDBERG**, a hill in the canton of Berne, rising abruptly out of the waters of lake Thun, on the s. side. It is interesting as the site of an institution, established by Dr. Guggenbühl, for the cure of cretinism (q.v.), and supported by contributions from far and near. The sanguine hopes raised as to the good to be effected by the healthiness of the situation, and the mode of treatment followed, have been greatly disappointed, little alleviation being perceptible. The establishment still exists as an asylum for cretins.

**ABEN-ESRA**, properly Abraham-Ben-Meir-Ben-Esra, b. 1093 in Spain, d. 1168 in Rome, was one of the most learned Jews of his times. He understood the Hebrew, Arabic, and Aramaic languages; had considerable knowledge of mathematics, astronomy, and medicine; was a scientific observer; and generally distinguished himself as a sagacious thinker. Having left his native land, he visited Lombardy, Provence, France, Egypt, and England, and passed the later years of his life in Rome; everywhere giving lectures on grammar, theology, astronomy, etc., besides writing and translating several works in Hebrew and Arabic. His *Commentaries on the Old Testament* are the most important of his works, which include some treatises on astrology, since published in Latin. The scholastic writers mention Aben-Esra as **ABENARE** or **AVENARD**.

**ABENSBURG**, a t. in Lower Bavaria, 18 m. s.w. of Ratisbon. It has warm springs and fine castle ruins. April 20, 1809, Napoleon here defeated the Austrians and opened the way for the victory of Eckmühl.

**ABEOKUTA**, a city, or rather collection of small towns or villages, capital of the territory of Egba, in the Yoruba country, on the w. coast of Africa. A. is about 80 m., by the river Ogun, n. of Lagos (on the Bight of Benin), and 240 m. w. of the Lower Niger. It is situated 567 ft. above the sea-level, on an undulating plain, fantastically broken by masses of gray granite, and covered with bush. Looking down on the city from a height, Burton says: "The scene before me wants neither grandeur nor beauty; there is a gorgeous growth around—hill, water, forest, and homestead all are present. \* \* \* The primeval forest has been cleared away around the town, yet there is not a vestige of cultivation; and if you ask for the farms, you are told that they are distant some 5 to 20 m. The reason is that, if placed within reach, nothing could defend them from the depredations of robbers and cattle." A. is surrounded by a wall of hardened mud, from 18 to 20 m. in circumference, between 5 and 6 ft. high, without embrasure, and pierced here and there "with an aperture by way of loophole." The town itself Burton found to measure 4 m. by 2. The houses are square, and built of mud, with tall roofs of thatch; the streets are narrow and irregular, and the only scavengers are the sun, the vulture, and the pig. There are a few European traders and missionaries; the success of the latter, according to Burton, not having been extraordinary. There is a trade in palm-oil and grain. Pop. estimated at 150,000.—For further interesting details, see R. F. Burton's *Abeokuta and the Camaroons Mountains* (1863).

**ABER** is a Celtic word which enters into the composition of several names of places, chiefly in Wales and Scotland. It indicates the mouth or embouchure of a stream, either into the sea or into another river—as Aberbrothock, at the mouth of the Brothock, in Forfarshire; Abergavenny, at the junction of the Usk and Gavenny, in Wales.

**ABERAVON**, or **PORT TALBOT**, a parliamentary and municipal borough on the s. coast of Wales, in Glamorganshire, near the mouth of the Avon, about 30 m. w. of Cardiff. It is beautifully situated near the valley of Cwm Avon, in which are extensive mining-works belonging to the Bank of England. The town has a good harbor and docks, is a station on the South Wales Railway, and communicates regularly with Bristol by steamers. The valley of the Avon is shut in by lofty hills, while every available space is occupied by copper and iron works. There is a stone bridge of one arch over the river. A. imports ore from Cornwall; and exports copper, tin, and coal. Along with Swansea, Neath, etc., it returns one member to parliament. Pop. of municipal borough, (1871), 3574; of parliamentary borough, 11,906.

**ABERBROTHWICK**. See **ARBROATH**, *ante*.

**ABERCROMBIE**, **JAMES**, 1706-81; a British general, b. in Scotland. He was commander-in-chief in America in 1758, and in July of that year was defeated in an attack upon Ticonderoga, losing heavily in men. He was superseded by Sir Jeffrey Amherst, who recaptured Ticonderoga and Crown Point. Returning to England he became a member of parliament and deputy-governor of Stirling Castle.

**ABERCROMBIE**, **JOHN**, in his own day the most eminent of Scottish physicians, and still worthy of remembrance for his professional and moral excellence, was born in 1781, at Aberdeen, where his father was long a parish minister. He studied medicine in Edinburgh, taking his degree in 1801, and thenceforth devoted himself to the practice of his profession in the Scottish capital. At a comparatively early age he attained a high reputation; and after the death (in 1821) of the celebrated Dr. Gregory, he became recognized as the first consulting physician in Scotland. His professional writings contributed to his celebrity, which was still further extended by the publication, in 1830 and 1833, of his works on *The Intellectual Powers* and *The Moral Feelings*. These works have no pretensions to originality or depth of thought, but acquired, from the high personal character of the author, a reputation during his life which a few years have sufficed to impair. They possess, however, the merit of being more readable than many works of the same class, and are pervaded by a moral and religious feeling which, in the case of their pious and benevolent author, was perfectly genuine. Dr. A. died suddenly, Nov. 14, 1844. Among the honors bestowed upon him during his life were the degree of M.D. from Oxford, the rectorship of Marischal college, the vice-presidency of the Royal Society of Edinburgh, and the office of physician in ordinary to her majesty for Scotland.

**ABERCROMBY**, **DAVID**, a Scotch metaphysician, who died early in the 18th c., of whom little is known except through his writings. He had been a Roman Catholic priest, but abjured and published his reasons in *Protestancy safer than Popery*, in 1686. His most notable work is *Discourse on Wit*, published in 1685, which has been ascribed to Patrick Abercromby and other authors. In medicine he is known through his *Nova Medicinæ Praxis*, *De Pulsus Variatione*, and others on the effect of salivation, etc. His *Opuscula* were collected in 1687.

**ABERCROMBY**, **SIR RALPH**, was born at Menstry, in Clackmannanshire, in 1734. He was designed by his father for the Scottish bar; and studied from 1752 to 1755 at the universities of Edinburgh and Leipsic. His natural inclination, however, pointed to a military life; and in 1758 he went to Germany as a cornet in the 3d dragoon guards. In 1780 he raised a regiment in Ireland, which was called the 103d, or King's Irish. It was disbanded in 1783; and the next ten years were spent by Sir Ralph in the retirement of a country life. He had married in 1767. In 1793, he accompanied the duke of York to

Holland. His conduct throughout that unfortunate campaign, especially during the disastrous retreat in the winter of 1794-95, won him the love and admiration of the whole army. On his return to England, he was appointed to the chief command of the expedition to the West Indies, which, notwithstanding the vexatious obstruction of his designs, he conducted with distinguished success, taking Grenada, Demarara, Essequibo, St. Lucia, St. Vincent, and Trinidad. Soon after he was appointed commander of the forces in Ireland; but his enlightened and manly remonstrances against the policy of government towards that country occasioned his removal to a similar command in Scotland. In 1799, he was appointed second in command to the duke of York in the expedition to Holland, still more unhappy and ignominious in its results than the former. A. alone acquitted himself on all occasions with entire credit. On his return, he was appointed to command the expedition to the Mediterranean. The fleet anchored in Aboukir bay on the 2d of March. On the 7th, A. reconnoitred the shore in person. Before mid-day of the 8th, the British troops were in possession of the sand-hills that commanded the shore, having landed in the face of a storm of shot that ploughed the water around them. On the 13th, the enemy were driven within the lines of Alexandria. On the morning of the 21st, Menou attempted to surprise the British camp. He found them ready, under arms. In the glorious action that ensued, the British commander was struck by a musket-ball in the thigh; but not till the battle was won, and he saw the enemy retreating, did he show any sign of pain. He was borne from the field in a hammock, cheered by the blessings of the soldiers as he passed, and conveyed on board Lord Keith's ship. The ball could not be extracted; mortification ensued; and on the 28th he died, in the sixty-eighth year of his age. In the character of A. were combined the qualities that seem peculiarly characteristic of a true British soldier. He was at once gentle and brave, clear-sighted and cool in deliberation, in action prompt and daring, even to hardihood. Apart from his qualities as a soldier, he was a man of liberal accomplishments, free from prejudices, and of sound practical judgment.—The national gratitude to this eminent man took the form of a peerage conferred on his widow, afterwards enjoyed by his eldest son, with the title of baron Abercromby.—His third son, JAMES ABERCROMBY, after being m.p. for Edinburgh and speaker of the reformed house of commons, was raised to the British peerage in 1839, with the title BARON DUNFERMLINE. He died in March, 1858.

ABERDARE, a t. in Wales, Glamorgan co., on the right bank of the Cynon, 4 m. s.w. of Merthyr-Tydvil, in a rich mineral district, having extensive coal and iron works. Tin works have recently been opened. A. is connected with the coast by a canal and railway. Its growth of late years has been remarkable. Pop., '41, 6471; in '71, 37,744.

ABERDEEN, the chief city and seaport in the n. of Scotland, lies in lat. 57° 9' n. and long. 2° 6' w., in the s.e. angle of the co. of the same name, at the mouth of the river Dee, which forms its harbor, and 111 m. n. of Edinburgh. Its mean annual temperature is 45° 8 F., and rainfall, 30.57 in. William the lion made A. a royal burgh in 1179. The English burned A. in 1336, but it was soon rebuilt, and called New Aberdeen. Old A., within the same parliamentary boundary, is a small t. a mile to the n., near the mouth of the Don. King's college and university, founded in old A. in 1494, and Marischal college and university, founded in new A. in 1593, were in 1860 united into one institution, the university of Aberdeen. It had 797 students in 1874-5, and its general council, with that of Glasgow university, sends one member to parliament. In the 17th c. A. had become an important place, but it suffered much from both parties in the civil wars. It has now a flourishing trade and large manufactures, and its handsome light-gray granite architecture is much admired. The harbor has been much enlarged and deepened, and a new breakwater has been lately built. The total registered shipping of the port in 1874 amounted to 103,149 tons. The chief exports are linens, woollens, cotton-yarns, paper, combs, granite (hewn and polished), cattle, grain, preserved provisions, and fish. A. has the largest comb and granite-polishing works in the kingdom. It has considerable iron-works and much ship-building. The A. clipper-bow ships are celebrated as fast sailers. A. has above 60 places of worship, and 10,000 children at school. Connected with A., which has always been a celebrated seat of learning, have been the names of Barbour and Boece; bishops Elphinstone, Dunbar, and Forbes; the earls Marischal, Jameson, Gregory, Reid, Beattie, Campbell, and Hamilton. The British association met here in 1859, under the presidency of the prince consort. The burgh is governed by 25 councillors, including a provost, six bailies, a dean of guild, etc. Pop. in '71, of municipal burgh, 76,248; parliamentary burgh, 88,125, with a valuation in 1878-9 of £387,045, and sending one member to parliament.

ABERDEEN, a t., the co. seat of Monroe co., in n.e. Mississippi, on the w. bank of the Tombigbee river; 233 m. from Mobile by the Mobile and Ohio railroad. It has steam-mills, a cotton press, a fine court-house, a seminary for women, and a large trade in cotton. Pop. '80, 4000.

ABERDEEN, GEORGE HAMILTON GORDON, EARL OF, was born at Edinburgh in 1784. He was educated at Harrow and at St. John's college, Cambridge, where he took his degree of M.A. in 1804. Before this, on succeeding to the earldom in 1801, he made a tour through Greece, the record of which is preserved in Byron's well-known line—

"The travelledthane, Athenian Aberdeen."

In his twenty-second year, he was elected one of the sixteen Scottish representative peers, and entered public life as a tory. In 1813, he was appointed ambassador to the Austrian court, and conducted the negotiations which terminated in the alliance of that power with Britain. At this time he formed that close friendship with prince Metternich which so decidedly influenced his subsequent policy as a statesman. On the conclusion of the war, he was elevated to the British peerage as viscount Gordon. From this time till the year 1828, his lordship made no prominent appearance in public life. In that year he took office in the new ministry formed under the duke of Wellington. The general principle which guided his policy, as secretary of state for foreign affairs, was that of non-interference in the internal affairs of foreign states, which, joined to his well-known sympathy with such statesmen as Metternich, has exposed him—not always justly—to the suspicion of being inimical to the cause of popular liberty. His gradual abandonment of high tory principles was evinced by his support of the bill for the repeal of the test and corporation acts, and of the Roman Catholic emancipation act. From the fall of the Wellington ministry till the Peel administration in 1841, his lordship was out of office, with the exception of his brief administration of the colonial office in the tory ministry of 1834-5. In 1841, he again received the seals of the foreign office. M. Guizot was at that time foreign minister in France, and the two statesmen acted in cordial alliance. The conclusion of the Chinese war, the Ashburton treaty, and the Oregon treaty, were the principal services rendered to the country during his administration of foreign affairs. His act in 1843 for removing doubts regarding the admission of ministers to benefices in Scotland, neither saved the disruption of the church nor pleased those for whom it was meant, and is now virtually repealed by the "act for the abolition of patronage" (1874). From the time that the repeal of the corn-laws became the rallying-point of the Peel party, he became identified with their policy. In 1846, he resigned with Sir Robert Peel. In 1853, on the resignation of lord Derby, the extraordinary state of parties necessitated a coalition, and lord A. was selected as the fittest man to head the new ministry, which for some time was extremely popular. The feeble and vacillating policy displayed in the conduct of the war with Russia gradually undermined its stability, and the disastrous mismanagement brought to light in the winter of 1854, in all departments of the public business connected with the war, filled up the measure of the popular discontent. On Feb. 1, 1855, lord A. resigned office. He was author of an essay on Grecian architecture (1822). He died in 1860.

**ABERDEENSHIRE**, a large maritime co. in the e. of Scotland, between 56° 52' and 57° 43' n. lat., and 1° 49' and 3° 48' w. long.; bounded n. by Banffshire and the North sea; e. by the North sea; s. by Kincardine, Forfar, and Perth shires; w. by Inverness and Banff shires. It is the fifth in size of the Scottish counties; greatest length, 102 m.; greatest breadth, 50 m.; with 60 m. of sea-coast, and an area of 1970 sq. m. It has long been popularly divided into five districts (proceeding from s.w. to n.e.)—Mar, Strathbogie, Garioch, Formartin, and Buchan. A. is generally hilly, and in the s.w. (Braemar) entirely mountainous, the Grampians running along the s. side, and branching off to the n.e. and n. Braemar contains the highest mountains: Ben-Muic-Dhui (next to Ben Nevis, the highest hill in the British isles), 4296 feet; Cairntoul, 4245; Cairngorm, 4083; Ben-na-Buir, 3860; Lochnagar, 3770. The predominant rocks are granite and gneiss. The granite is very durable, and is much used for building and polishing. The chief rivers are the Dee (96 m. long), Don (78 m.), and Ythan (37 m.), which run eastward into the North sea; and the Doveran (58 m.), which runs n.e. into the North sea (see DEE, DON, DOVERAN). On the upper part of the Dee is *Balmoral* (q.v.). The Ythan yields the pearl-muscle, but rarely pearls of any value. The mean annual rainfall of A. varies from 30 to 37 in. Clay soils predominate near the coast, loamy soils near the centre, and poor, gravelly, sandy, and peaty soils elsewhere. The most fertile parts lie between the Don and Ythan, and in the n.e. angle of the co. Nowhere in the kingdom have the natural disadvantages of soil and climate been more successfully overcome. A. has 188 m. of railway, and 2359 m. of public roads, the latter supported by rates, and not by tolls. The chief towns and villages are Aberdeen (new and old), Peterhead, Fraserburgh, Huntly, Kintore, Inverury, and Turiff. The co. returns two members to parliament; the city of Aberdeen, one; and the burghs of Peterhead, Kintore, and Inverury, with Elgin, Cullen, and Banff, one. About 37 per cent of the area of A. is cultivated. In 1875, it had 193,111 acres in oats, 19,756 in barley and bere, 95,363 in turnips; and 169,739 cattle. A. produces one fifth of the turnips and one seventh of the cattle reared in Scotland, and is unsurpassed in breeding and feeding stock. The fisheries on the coast are very productive. Pop. in '71, 244,603, with 34,589 inhabited houses, and 84.83 per cent of the children, of ages 5 to 13, receiving education. The munificent Dick and Milne bequests for parochial schoolmasters has given A. a high place in the statistics of education. A. has about 290 places of worship, 105 being established, and 100 free. Value of real property (exclusive of railways), in 1873-79, £849,102.

**ABERDEVINE**, or *SISKIN*, *fringilla spinus*, a song-bird, nearly allied to the goldfinch, with which it is placed by Cuvier and others in the new genus *carduelis*. It is rather smaller than the goldfinch, and less elongated in form. The crown of the head

and the throat are black, the nape dusky green, and there is a broad yellow streak above and behind each eye. It is only a winter visitant of Britain, and breeds in the n. of Europe, building its nest in high trees. It is frequently kept as a cage-bird, being easily tamed, and breeds freely with the canary. It feeds on the seeds of the thistle, alder, birch, and elm, and occasionally does great damage to the hop plantations in Germany. In France it injures the blossoms of the apple trees.

**ABERGAVENNY**, the Roman *Gobanium*, a market t. of England, in Monmouthshire, 13 m. w. of Monmouth, is beautifully situated in the valley of the Usk, the garden of Wales, at the junction of the Usk and Gavenny, and is surrounded on every side by high mountains and thick woods. The town is regularly and compactly built, and many improvements have of late years been made. St. Mary's church, which was once a fine cruciform structure, and contains many interesting monuments, has been spoiled by alterations. The castle, which is very ancient, is now a ruin. The principal modern building is the lunatic asylum. There are collieries and iron-works in the neighborhood. The Hereford and Tredegar railway passes near the town. Pop. '71, 4803.

**AB'ERNETHY, JOHN**, 1680-1740; b. Londonderry; an Irish dissenting minister, son of a dissenter. He was educated at Glasgow and Edinburgh, and licensed to preach before the age of 21. He was ordained at Antrim in 1708; in 1717 he was invited to a congregation in Dublin, as colleague of Rev. M. Arbuckle, but he declined and remained at Antrim. This refusal was considered ecclesiastical rebellion, and a fierce controversy ensued, the parties dividing into "subscribers" and "non-subscribers." Though himself strictly evangelical, A. and his associates were remotely the occasion of the contest which ended in eliminating Arian and Socinian elements from the Irish Presbyterian church. In 1736, A. and all the "non-subscribers" were turned out with due ban and solemnity. Yet only four years afterwards he was called to a "regular" congregation in Dublin. In 1731, in the controversy regarding the test act, A. took broad ground "against all laws that, upon account of mere differences of religious opinions and forms of worship, excluded men of integrity and ability from serving their country." He was a century ahead of the time, having to argue against those who denied that a Roman Catholic or a dissenter could be a "man of integrity and ability." A. was foremost where unpopular truth and right were to be maintained, and his *Tracts*, collected after his death, did good service for generations.

**AB'ERNETHY, JOHN**, a very eminent English surgeon, was born in London in 1734. His grandfather was the Rev. John Abernethy, an Irish Presbyterian clergyman, who acquired distinction by his writings, and his bold adoption of bishop Hoadly's views on the right of private judgment and the subscription of confessions. A.'s early tastes disposed him to the bar; but in 1780 he was apprenticed to Mr. (afterwards Sir Charles) Blicke, surgeon of St. Bartholomew's hospital. He attended at the same time the lectures of John Hunter and Sir W. Blizard. In 1787, A. was elected assistant-surgeon to St. Bartholomew's, an office which he filled for twenty-eight years; at the end of which time he was appointed surgeon, with a salary. Soon after his election, he began to lecture in the hospital on anatomy and surgery, and may be said to have laid the foundation of its character as a school of surgery. At first, he manifested extraordinary diffidence, but his power soon developed itself; and his lectures at last attracted such crowds, that, in 1790, it was found necessary to build a lecture-theatre in the hospital for his use. His clear, simple, and positive style, illustrated by an inexhaustible variety of apt anecdotes, made him the most popular medical teacher of his day. In 1813, he was appointed surgeon to Christ's hospital, and in 1814, professor of anatomy and surgery to the college of surgeons. His practice increased with his celebrity, which the singular eccentricity and occasional rudeness of his manners contributed to heighten. Notwithstanding, however, the irritability and harshness which he so often exhibited, those who knew him best bear unanimous testimony to the generosity and kindness of his character. He married in 1800, and had several children. He died at Enfield, in 1831. Of his works, the most original and important is his *Observations on the Constitutional Origin and Treatment of Local Diseases*, first published in 1806, in which a simple principle, till then little attended to, was made the foundation of much important and ingenious observation. His *Lectures on the Theory and Practice of Surgery* were published in 1830.

**ABERRATION OF LIGHT** is an apparent alteration in the place of a star, arising from the motion of the earth in its orbit combined with the progressive passage of light. When rain is falling perpendicularly, a drop entering at the top of an upright tube at rest, will go through; but if the tube be carried forward horizontally, a drop entering the top will strike against the side before it goes far; and to make the drop go through the tube in motion, we must incline the top of it forward in the direction of the motion. The amount of this inclination will be the greater the more rapid the motion of the tube is compared with that of the falling drops. If in the time that a drop takes to fall through the height AB of the parallelogram in the annexed cut, the inclined tube BC is moved horizontally over a space equal to its breadth, AC, a drop entering the top of the tube will descend without touching the sides. For in half the time the tube will be in the position B'C', and the drop in the position *d*; and so for any other portion of the time. This exactly illustrates the astronomical phenomenon in question. The tube is a telescope directed to receive the light of a star; this tube, and the person looking

through it, are moving along with the earth in its orbit, and the light may be conceived as particles coming from the star like drops of rain, moving much faster, no doubt, still requiring time. That a particle or ray of light from the star may pass through the tube, it must be directed, not straight to the star, but at a slight angle in the direction of the earth's motion. Thus the place where we see the star is not its true place. As the earth's motion, however, is slow compared with the velocity of light, the angle of inclination is small—never exceeding about  $20''$ . The result is, that, if we conceive the true place of a star as a fixed point, the apparent place of the star describes about this true place, in the course of a year, an ellipse whose greater axis is about  $40''$ . The aberration of light was discovered by the English astronomer Bradley, in 1727, while seeking to determine the parallax of certain fixed stars.

**ABERT, JOHN JAMES**, 1790-1863; an American military engineer. He was educated at West Point, and long employed in the war department. He participated in the battle of Bladensburg, Aug. 4, 1814. In 1829, he was lt.-col. in command of the engineers and head of the topographical bureau. In 1832-33 he was commissioner for Indian affairs, and in 1838 made col. of the corps of engineers, having charge of the topographical service of the government until his retirement, Sept. 9, 1861.

**ABERYST'WICH**, a seaport of Wales, and one of the Cardigan districts of parliamentary boroughs. In 1872, 320 vessels, of a total tonnage of 18,316 tons, entered the port. A. is much resorted to for sea-bathing, and is well provided with good hotels and lodging-houses. Pop. '71, 6898.

**ABESSA**, a damsel in Spenser's poems, impersonating abbeys and convents. When Una asked if she had seen the red cross knight, A., frightened at the lion, ran into the house of Blind Superstition, and closed the door, which the lion broke open. The meaning is, that when Truth came, the abbeys and convents were alarmed and barred her out, but England (the lion) broke in the door.

**ABEYANCE**, a legal term importing that a freehold inheritance, dignity, or office is not vested in any one, but is in expectation, or suspended, until the true owner appears, or the right thereto is determined. Titles of honor are said to be in A. when it is uncertain who shall enjoy them. A parsonage remaining void is also said to be in A. This A. or suspense, being repugnant to the general principles of the tenure of land, is never allowed except when it is unavoidable. It finds no place in the law of Scotland, where it is a maxim that the *fee* of an inheritance, or the *right* of property, cannot be *in pendente*, but must be somewhere, for this, among other reasons, that creditors must know with whom the right of property is. Titles of honor and office stand on a different footing in Scotland, where, however, the general provisions of the law are so comprehensive as almost to exclude a case of A.

**AB'GAR**, the title of a line of kings of Edessa, in Mesopotamia. One of them is known from a correspondence which he is said to have had with Jesus Christ. A letter of A. entreating Jesus to come and heal him of disease, and offering him an asylum from the wrath of the Jews, together with the answer of Jesus, promising to send a disciple to heal A. after his ascension, are given by Eusebius, who professed to believe the documents to be genuine. The same opinion has been held by scholars here and there, and by many unlettered persons down to our own times; but there can be no reasonable doubt that the whole correspondence is fabulous. It has also been stated that A. possessed a picture of Jesus, and the credulous may still find such a picture either in Rome or Genoa. Still others report A. as the possessor of the handkerchief which a woman gave Jesus to wipe the sweat from his brow as he toiled under the weight of his cross, and say that the features of the Savior are miraculously imprinted thereon.

**A'BIAD, BAHR-EL**, the "White Nile," the western branch of the Nile above Khartoum. See NILE, *ante*.

**ABIATHAR**, a Jewish high priest; son of Abimelech, slain by Saul for receiving the fugitive David, to whom he was faithful, especially during Absalom's rebellion. For taking part in the rebellion of Adonijah, A. was deprived of his priesthood by Solomon, and banished.

**A'BIB**, the first month of the Jewish ecclesiastical year, and the seventh of the civil year; also called Nisan. It is rather a name for the season when new grain appears than for a month. According to the rabbins it began with the new moon of March.

**A'BICH, WILHELM HERMANN**, b. Berlin, Dec. 11, 1806; a German naturalist. He graduated in 1831, and in 1842 became professor of mineralogy in the university of Dorpat, and in 1853 member of St. Petersburg academy of sciences. A. has explored the Caucasus, Russian Armenia, northern Persia and Daghestan, and published several books on the geology, etc., of those regions.

**ABIES**. See FIR.

**ABIME'LECH**, a son of Gideon. When his father refused to take the title of king either for himself or children, A. set out to claim the sovereignty, slew seventy of his brothers, and was declared king. Three years afterwards the Shechemites made an unsuccessful attempt to throw off his rule. After destroying Shechem, A. went against Thebes, which had revolted, and here, while storming the place, was struck on the head by a piece of millstone thrown from the wall by a woman. To avoid an ignominious death he ordered his sword-bearer to run him through. His reign is regarded as the first attempt to establish a monarchy in Israel.

**ABIME'LECH**, a Philistine king, to whom Abraham represented Sarah to be his sister, and not his wife. Upon Abimelech soliciting her company, the fraud was exposed.

**ABINGDON**, a city in Knox co., Ill., on the line of the Chicago, Burlington and Quincy railroad, 85 m. n.e. of Quincy. It is the seat of the Hedding Methodist Episcopal college, and of the Abingdon college, under the management of the Christian denomination. Pop. '70, 948.

**ABINGDON**, the capital of Washington co., Va., 315 m. w.s.w. from Richmond. The co. was organized in 1776, and was the first locality named after George Washington. The town has good schools for girls, and a literary institute. Pop. '70, 3163.

**ABINGDON**, a market t. in Berkshire, England, situated at the junction of the Ock and the Thames. The name was originally Abbendon (town of the Abbey). It sends a member to parliament. Pop. of parliamentary borough, '71, 6571.

**ABINGER**, JAMES SCARLETT, Lord, b. about 1769, d. 1844; an English lawyer, better known as Sir James Scarlett. He was a member of parliament for Peterborough 1818-30, and later for Malden, Cockermouth and Norwich. From a moderate whig he became a strong Tory. He was a popular advocate, and had remarkable power in addressing juries; was attorney-general two years; in 1834 appointed lord chief baron of the exchequer, and Jan. 12, 1835, made a peer with the title of baron.

**ABINGTON**, a township of Mass., U. S., 20 m. s.e. of Boston, with a pop. in '70 of 9808, engaged in the manufacture of boots, shoes, and nails.

**ABINGTON**, FRANCES, b. 1731, d. London, Mar. 4, 1815; a famous English actress, daughter of Barton, a common soldier. As an errand-girl, she picked up French from a milliner. She became a flower-girl around theatres, and made her first appearance at the Haymarket as "Miranda," in "The Busybody," soon after marrying Abington, her music master, from whom she separated. She was a favorite in Dublin, opening with "Kitty," in "High Life Below Stairs," for Tate Wilkinson's benefit, who gives an animated picture of her success. The headdress she wore was adopted by the women of fashion, and the "Abington cap" became famous. Returning to England in 1765, she was warmly received by Garrick. After the retirement of Mrs. Pritchard and Kitty Clide she had no rivals on the London stage, and became the first comic actress of the period, appearing last, April 12, 1799. She left legacies to the theatrical funds.

**ABIOGENESIS** (See GENERATION, SPONTANEOUS, *ante*), the name for the supposed production of living matter from non-living; one of the fundamental and oldest questions in biology; recently much studied because of more accurate means of experiment, and partly because of its important bearing on evolution, correlation of forces, and the theory of infectious diseases. Though the doctrine of A. may not be said to be either established or refuted, we can believe in gradual progress towards a solution. The defenders of A., while interpreting the results of past observations in their favor, are less disposed to rest on these, preferring to argue from such wide analogies of evolution and correlation as seem to support their doctrines. Haeckel embraces A. as a necessary and integral part of the theory of universal evolution; and Huxley, from the other side, confesses that if it were given to him to look beyond the abyss of geologically recorded time to the more remote period when the earth was passing through early physical and chemical conditions, he should expect to be a witness of the evolution of living protoplasm from non-living matter. Thus it is not so much on the ground of fact and experiment that abiogenesisists are convinced of the truth of their doctrine as because it seems to gain confirmation from a much wider scope: because it aids the theory of evolution by tracing organic into inorganic matter; because it fosters the increasing unpopularity of the hypothesis of a special vital force; because it would well agree with the principle of uniformity, and by disclosing the existence of unknown worlds of material for development would relieve natural selection from the immense labor of evolving all species from one or a very few primary forms.

**ABIPONES**, South American Indians, living between Sante Fé and Santiago, driven from Paraguay by the Spaniards. They are chaste and otherwise virtuous except that they practice infanticide. It has not been discovered that they have any idea of God. The men seldom marry before 30 years old; the girls are bought from their parents, but often repudiate the bargains and run away from their husbands. They suckle their infants till two years old, which may be an inducement to killing them. The men are brave in war, good horsemen and excellent swimmers.

**ABJURATION, OATH OF.** Formerly there were three oaths, called the oaths of allegiance, supremacy, and abjuration, required of all persons before admission to any public office; and next, by the 21 and 22 Vict. c. 48, one oath was substituted for the three referred to, and was as follows:

"I, A. B., do swear that I will be faithful and bear true allegiance to her majesty queen Victoria, and will defend her to the utmost of my power against all conspiracies and attempts whatever which shall be made against her person, crown, or dignity, and I will do my utmost endeavor to disclose and make known to her majesty, her heirs and successors, all treasons and traitorous conspiracies which may be formed against her or them; and I do faithfully promise to maintain, support, and defend to the utmost of my power the succession of the crown, which succession, by an act entitled *An act for the further limitation of the crown, and better securing the rights and liberties of the subject*, is and stands limited to the princess Sophia, electress of Hanover, and the heirs of her body, being Protestants; hereby utterly renouncing and abjuring any obedience or allegiance unto any other person claiming or pretending a right to the crown of this realm; and I do declare that no foreign prince, person, prelate, state, or potentate, hath or ought to have any jurisdiction, power, superiority, pre-eminence, or authority, ecclesiastical or spiritual, within this realm: And I make this declaration upon the true faith of a Christian. So help me God."

The subject of oaths was, however, again revised by the legislature in 1868 and 1871, and was settled in the following manner by the act 31 and 32 Vict. c. 71.

The former statutes prescribing certain forms of oaths were repealed, and the above form of oath was abolished, and the abjuration altogether omitted as no longer fit to be perpetuated among the solemn sanctions applicable to high offices. Three several oaths were prescribed to take the place of the former oaths, and these were—(1) the oath of allegiance, (2) the official oath, (3) the judicial oath. Certain high officers now require to take both the oath of allegiance and the official oath, and certain other officers require to take both the oath of allegiance and the judicial oath. The oath of homage taken by archbishops and bishops, and of canonical obedience to them, was left unaffected. But the oath of allegiance was substituted for the oaths taken by the clergy, and members of parliament, and judges, etc. This oath of allegiance is in the following form: "I, A. B., do swear that I will be faithful and bear true allegiance to her majesty, queen Victoria, her heirs and successors, according to law. So help me God." This oath gets rid of the objections formerly felt by Jews in taking the oath.

The act 34 and 35 Vict. c. 48 repealed nearly all the previous statutes as to oaths.

The act of 10 Geo. IV. c. 7, which settled the form of oath to be taken by Roman Catholics instead of the oaths of allegiance, supremacy, and abjuration, has been repealed as regards the form of oath; but as it was part of a memorable settlement, it is here given:

"I, A. B., do sincerely promise and swear that I will be faithful and bear true allegiance to her majesty queen Victoria, and will defend her to the utmost of my power against all conspiracies and attempts whatever, which shall be made against her person, crown, or dignity; and I will do my utmost endeavor to disclose and make known to her majesty, her heirs and successors, all treasons and traitorous conspiracies which may be formed against her or them: And I do faithfully promise to maintain, support, and defend, to the utmost of my power, the succession of the crown, which succession, by an act, entitled *An act for the further limitation of the crown, and better securing the rights and liberties of the subject*, is and stands limited to the princess Sophia, electress of Hanover, and the heirs of her body, being Protestants; hereby utterly renouncing and abjuring any obedience or allegiance unto any other person claiming or pretending a right to the crown of this realm: And I do further declare that it is not an article of my faith, and that I do renounce, reject, and abjure the opinion that princes excommunicated or deprived by the pope, or any other authority of the see of Rome, may be deposed or murdered by their subjects, or by any person whatsoever: And I do declare that I do not believe that the pope of Rome, or any other foreign prince, prelate, person, state, or potentate, hath, or ought to have, any temporal or civil jurisdiction, power, superiority, or pre-eminence, directly or indirectly, within this realm. I do swear that I will defend, to the utmost of my power, the settlement of property within this realm, as established by the laws; and I do hereby disclaim, disavow, and solemnly abjure any intention to subvert the present church establishment, as settled by law within this realm: And I do solemnly swear that I never will exercise any privilege to which I am or may become entitled, to disturb or weaken the Protestant religion or Protestant government in the United Kingdom: And I do solemnly, in the presence of God, profess, testify, and declare that I do make this declaration, and every part thereof, in the plain and ordinary sense of the words of this oath, without any evasion, equivocation, or mental reservation whatsoever. So help me God."

This oath having frequently been considered objectionable, as covertly imputing disloyalty and insincerity to the Roman Catholic body, has been superseded by the above short oath of allegiance common to all parts of the United Kingdom.

**ABLATIVE CASE.** See **DECLENSION.**

**ABKHA'SIA**, or **ABASIA**, a part of Asiatic Russia on the Black sea, bet. 42° 30' and 44° 45' n. and 37° 3' and 47° 36' e. High mountains separate A. from Caucasia; on the s. it is bounded by Mingrelia, and s.w. by the Black sea. The country is mountainous, with well watered valleys and mild climate. Grain, grapes, and other fruits are raised; honey is exported to Turkey, and excellent arms are manufactured. Some of the inhabitants till the soil, some raise cattle and horses, and some are pirates and robbers. There still continues a considerable trade in slaves. This country was subdued by the emperor Justinian, who introduced the Christian religion. Since then, Persia, Georgia, and Turkey have ruled; the latter expelling Christianity and establishing Moslemism. By the treaty of Adrianople Russia obtained the fortresses in the territory, but until the insurrection in 1866 the native chiefs had almost unlimited power. Pop. est. from 50,000 to 250,000. Chief t., Sukumkaleh.

**ABLUTION.** See PURIFICATION.

**ABLUTION**, a symbol of purification, as when Aaron and his sons were dedicated to the priestly office. A. was required of all the Israelites as a preparation for receiving the law at Mt. Sinai. It was a religious custom with other nations also, particularly for those to be inducted into the mysteries of Eleusis. Priests among the Hebrews were required to wash their hands and feet before approaching the sacred altar; and in the early Christian church, officiating ministers laved their hands in view of the people immediately before the communion services. Among the Egyptians A. was carried to great excess. Herodotus says their priests shaved the entire body once in three days, so that no unclean thing should be upon them in the time of worship, and that they bathed in cold water twice in the night and twice in the day time. Mohammedans, both priest and lay, are noted for their frequent washings. The law of Moses directed A. for physical defilements also, and specified periods when uncleanness should cease. This, too, is a Moslem practice. A. was a sign of a declaration of innocence, and in the case of one found slain, the murderer being unknown, the rulers of the city sacrificed a heifer, and the nearest of kin of the person slain washed their hands over the sacrifice, declaring, "Our hands have not shed this blood; neither have our eyes seen it." Pilate's hand-washing has been thought to be prompted by the Hebrew custom; but such A. was the custom on many occasions among the Romans and Greeks. The Pharisees were so excessive in A. that they were rebuked for the hypocrisy of it. They had rules so exact that one could scarcely rise up or sit down without some infraction of them. They extended A. to inanimate objects also, requiring the cleansing (ceremonially, not merely for cleanliness) of pots, dishes, tables, etc. A. is a ritualistic term in Roman Catholic service for the use of wine and water after the eucharist, to cleanse the cup and the fingers of priests. The Greek church has A. as a ceremony seven days after baptism.

**ABNER**, the son of Ner, and uncle of Saul and commander of his army. After Saul's death, the tribe of Judah recognized David, while Abner prevailed upon the other tribes to recognize Saul's son, Ishbosheth. David sent his army, under Joab, into the field, and A. was defeated. In his flight, A. being hotly pursued by Asahel, turned and slew him. According to usage, Joab, as next of kin to Asahel, became the avenger of blood. Afterwards A. went over to David, who promised to make him chief of the armies on the reunion of the two kingdoms; but A. was killed by Joab and his brother Abishai. Probably not only the avenging of Asahel, but jealousy lest A. should rise above him, moved Joab to the slaying.

**ABO** (pronounced *Obo*), the chief t. of the government of Abo, in Finland, now belonging to the Russian empire, is situated on the river Aurajokki, near its embouchure in the gulf of Bothnia; pop. '75, 21,794. The town was founded by the Swedes in 1157, and remained the capital of Finland until 1819. In the year 1827 a great part of the town, including the university buildings, was destroyed by fire, and consequently the university was removed to Helsingfors, now the capital.—The *Peace of Abo* (1743), between Sweden and Russia, put an end to the war commenced by Sweden, under French instigation, in 1741. In this war Russia had gained possession of the whole of Finland through the misconduct of the Swedish generals. In this treaty the river Kymene was made the boundary between the territories of Sweden and Russia; but by another peace, concluded in 1809, the whole of Finland, as far as the Tornea, was ceded to Russia.—The government of Abo-Björneborg has an area of 9450 sq.m., and a pop. in '70, of 310,159.

**A'BO-BJÖRNEBORG**, a department of Finland, on the gulfs of Finland and Bothnia, 9895 sq.m. It has general commerce, ship-building, and government factories. Pop. '67, 319,784; chief t., Abo.

**ABOLITIONISTS**, a term used to designate a party in the U. S., who sought the immediate and total abolition of slavery. See SLAVERY. Abolitionist views had long been held by many, especially by members of the society of Friends; but the term was not commonly used until an aggressive party spread from New England throughout the north and west, demanding immediate and unconditional emancipation. After about 30 years of agitation, the A. became sufficiently powerful to get some of their doctrines adopted by the republican party. The ends of the A. were gained when, under Lincoln's administration, slavery was abolished, Jan. 1, 1863.

**ABOMA'SUM**, the fourth stomach of ruminating animals, or the *rennet*. From the omasum the food is deposited in the A., a cavity considerably larger than either the second or third stomach, although smaller than the first one. The A. is that part of the digestive apparatus which is analogous to the single stomach of other mammalia, as the food there undergoes the process of chymification, after being macerated and ground in the first three stomachs.

**ABOMEY**, the capital of Dahomey, West Africa; 7° n. 2° 4' e.; about 60 m. n. of Whydah, the port of the kingdom. A. is a clay-built town, surrounded by mud-built walls and a moat, and is spread over a large area, some of which is under cultivation. The houses stand far apart; there are no regular streets, and the town is very dirty. There are four market-places for trade in palm-oil, ivory and gold, the business being done by Mohammedan traders. In A. is the palace of the king of Dahomey, which is frequently the scene of human sacrifices. There is a "custom" (sacrifice) held annually at which many criminals and war-captives are slaughtered; and whenever a king dies there is a "grand custom" at which as many as 2000 men and women have been butchered. The slave trade still prospers, neither Great Britain nor any other government being able to stop it unless by a war of extermination. The pop. is about 30,000.

**ABOMINATION OF DESOLATION**, the Roman standard which was set up in the temple of Jerusalem, to which the soldiery offered sacrifices as to an idol.

**ABORIGINES** (Lat.), properly the earliest inhabitants of a country. The corresponding term used by the Greeks was *autochthones*. The Roman and Greek historians, however, apply the name to a special people, who, according to tradition, had their original seats in the mountains about Reate, now Rieti; but, being driven out by the Sabines, descended into Latium, and, in conjunction with a tribe of Pelasgi, subdued or expelled thence the Siculi, and occupied the country. The A. then disappear as a distinct people, they and their allies the Pelasgi having taken the name of Latini. The non-Pelasgic element of the Roman population is supposed to represent these A., who would thus belong to the Oscans or Ausonians.

**ABORTION** is the term used in medicine to denote the expulsion of the product of conception (the impregnated ovum) from the womb before the sixth month of pregnancy. If the expulsion takes place after that date, and before the proper time, it is termed a *premature labor* or *miscarriage*. In law no such distinction is made. The frequency of abortion as compared with normal pregnancy is very differently estimated by different writers; but the best evidence leads us to the belief that abortion is of far more common occurrence than is generally supposed, and that it takes place on an average in one out of every three or four cases of pregnancy. The following are amongst the *causes predisposing* to this accident: (1) A diseased condition of either parent, and especially a syphilitic taint. (2) A peculiar temperament on the part of the mother. Those women who present a strongly marked nervous or sanguine temperament seem to abort with singular facility; and the same tendency is observed in those in whom the catamenial or monthly discharge is abundant or excessive. Again, very fat women, while they have a tendency to sterility, are liable to abort when pregnancy does occur. Any cause interfering with the normal oxidation of the blood—as, for instance, the constant breathing of impure air, may provoke abortion—a fact excellently illustrated by the experiments of Brown-Séquard on pregnant animals (rabbits), when he showed that the application of a ligature to the windpipe excited uterine contractions, ending, if the experiment were continued long enough, in abortion, but ceasing if air was freely admitted into the lungs. Change of climate, as from India to England, certainly predisposes to this accident; and it has been observed by various writers that great political events, the horrors of war, and famine, exert a similar action. The marvellous events that occurred in Paris in 1848 were speedily followed by an extraordinary number of abortions and of still-born children; and a similar fact had been previously noticed by the elder Nagele and Hoffmann during the famine of 1816 and during the siege of Leyden. Nor can there be a doubt that, amongst the causes predisposing to abortion, must be included the employment of such corsets and other garments as by their tightness interfere with the circulation of the blood, and alter the natural position of the womb and of the abdominal viscera. Many diseases supervening during the course of pregnancy, especially the eruptive fevers (as small-pox, scarlatina, etc.), almost invariably lead to abortion of a very dangerous character; and it has been known from the time of Hippocrates that intermittent fevers have this effect. Amongst the *direct causes* of abortion may be placed blows on the abdomen, falls, any violent muscular efforts, too long a walk or ride on horseback (indeed, women with a tendency to abort should avoid horseback during pregnancy), a severe mental shock, etc. Moreover, the death of the fœtus from any cause is sure to occasion abortion.

The *symptoms* of abortion vary according to the stage of pregnancy at which it is threatened, and according to the exciting cause. Many of these resemble those of congestion of the womb, such as a sensation of weight or painful pressure in the region of the loins or sacrum, extending to the bladder and rectum (with or without tenesmus, q.v.); these symptoms being aggravated by standing or walking, and being accompanied by chills, accelerated pulse, loss of appetite, and a general feeling of discomfort. A discharge of serous fluid, sometimes slightly tinged with blood, is then observed. The feeling of weight is replaced by pains, leading to the expulsion of the ovum, which, during

the first two months, is so small as commonly to escape detection. In more advanced stages of pregnancy, the pains are more severe, the discharge is more abundant, and consists chiefly of blood; and after more or less time, the product of conception escapes either in whole or in part. In the former case, the patient has little further trouble; in the latter, hæmorrhage will probably continue, and the parts retained may putrefy, and give rise to serious symptoms. After about the commencement of the fourth month, the symptoms gradually approximate to those presented in ordinary parturition.

In the treatment of abortion, prophylactics (or the guarding against causes likely to lead to it) hold the first place. Women liable to this affection should, on the slightest threatening, assume as much as possible the horizontal position, avoiding all bodily exertion or mental excitement. They should use non-stimulating foods and drinks, and keep the bowels open by gentle aperients—such as manna and castor-oil, and carefully avoid aloes and other medicines irritating the lower bowel. Moreover, a separate bedroom must be insisted on by the physician. We shall only enter into the curative treatment so far as to state that if it is deemed necessary to check hæmorrhage before professional aid can be called in, cloths soaked in cold water may be applied locally (care being taken to change them before they grow warm), and iced water containing an astringent, such as a little alum, may be given internally. Further proceedings must be left to the medical attendant.

There are occasional cases (as where the outlet of the pelvis is very contracted) in which it is necessary to induce abortion by professional means, but it would be out of place to enter into this subject in these pages. It cannot be too generally known that all attempts at procuring criminal abortion, either by the administration of powerful drugs or the application of instruments, are accompanied with extreme danger to the pregnant woman.

**ABORTION**, in criminal law. Neither in the law of England nor of Scotland is it murder to kill a child in the mother's womb (although it would be murder of the mother, if she died in consequence of the treatment). But the offence in question falls under the name A., which may be defined as the crime of administering to a pregnant woman any medicine, poison, or noxious drug, or of using any surgical instrument or other means, with the intent of procuring miscarriage. The English law on the subject is now regulated by the 24 and 25 Vict. c. 100, s. 58, which makes the offence felony, and subjects offenders to penal servitude for life, or for not less than three years, or to be imprisoned for any term not more than two years. In the law of Scotland, the procuring of A. is an offence at common law, punishable with "an arbitrary pain," and that equally whether the desired effects be produced or not. As in England, penal servitude or imprisonment, according to circumstances, is the punishment usually awarded.

**ABORTION** (*ante*). In the U. S. statutes vary in defining A., but the latest of N. Y. may serve as a sample of the tenor of legislation. They are (Rev. Stat. part iv. chap. i. title 2, sec. 9-12.): "Any person administering, prescribing, advising, or procuring to take by a woman with child any drug or thing whatever, or advising or procuring her to submit to operation with intent to procure miscarriage, unless necessary to preserve her life, shall, if the woman or child die through such means, be guilty of manslaughter in the second degree, punishable not less than four nor more than twenty years in state prison." A pregnant woman voluntarily causing A., except to preserve her life, suffers four to ten years. The sale of drugs and instruments for such purpose is criminal, whether to a woman pregnant or not; and the latest law makes the advertising of such medicines or instruments a misdemeanor. Convictions for actual criminal abortion, however, are rare, as it is naturally one of the most secret of crimes and among the most difficult to prove.

**ABOUKIR**, the ancient *Cinopus*, is now an insignificant village on the coast of Egypt, about 13 m. n.e. of Alexandria. The castle of Aboukir stands on the w. side of the bay of the same name. This bay is celebrated on account of Nelson's victory here gained over the French fleet, Aug. 1, 1798. The French fleet was stationed in a curved line near a small island guarded by a battery; but Nelson, with his usual intrepidity, forced a passage with half of his fleet of fifteen vessels between the island and the French line of battle, while the other half attacked the enemy in front. The French admiral De Brueys was killed by a cannon-ball, and his flag-ship, *L'Orient*, was destroyed by fire. Only 60 or 70 men were saved out of a crew of 1000. The French fleet was completely defeated, and only two vessels escaped.

**ABOUSAM'BUL**, or **IPSAM'BUL**, a place on the left bank of the Nile, in Nubia, lat. 22° 22', the site of two very remarkable rock-cut temples, perhaps the oldest existing specimens of architecture in the world. The larger temple contains fourteen apartments, hewn out of the solid rock. The first and largest of these is 57 ft. long and 52 broad, and is supported by two rows of massy square pillars (four in each row), 30 ft. high. To each of the pillars is attached a standing colossus, reaching to the roof, overlaid with a kind of stucco, and painted with gaudy colors. In front of the temple are four colossal seated figures—the largest pieces of Egyptian sculpture yet discovered. Reproductions of two of these, on the scale of the original (65 ft. in height), form very striking objects in the Crystal Palace at Sydenham, where also may be seen a fac-simile, on a small scale,

of the temple itself. These figures are supposed to represent Rameses the great (or Sesostris), whose achievements are described on the painted walls of the temple.

**ABOUT, EDMOND FRANÇOIS VALENTIN**, a French littérateur of great and rising reputation, was born at Dieuze, on the 14th Feb., 1828. He studied first at the Lycée Charlemagne, where he greatly distinguished himself; and afterwards at the École Normale. In the beginning of 1852, he received an appointment to the French school at Athens, an institution supported by the French government, with no very definite object, but with the hope that the members, who are selected on account of their attainments and promise in scholarship, and left perfectly free to choose their own studies, should be able to make contributions to the history or the archæology of Greece. A. remained at Athens for about two years. He wrote, as required by the terms of his appointment, a memoir for the academy of inspections, entitled *L'Île d'Egine*; but it was as the satirist of modern Greece, not as the investigator of Grecian antiquities, that his name first became familiar to the public. On his return to France, towards the end of 1853, he published *La Grèce Contemporaine*, a work which at once attained to great popularity, and was in course of the following year translated into several foreign languages. This work, full of lively and pointed sketches, abounding in shrewd and witty observation, its censures, very severe as they were, scarcely seeming offensive, from the ease and perfect good-humor with which they were conveyed, at once made its author be regarded as among the most promising writers of the day. It unquestionably affected European opinion as to the character and the capabilities of the modern Greek; the truthfulness of its portraiture being confirmed by all who had special knowledge of this people. It gave earnest of the qualities which go to making a brilliant novelist; and A. did not long delay to come before the public as a novelist. His first novel, *Tolla*, appeared in the *Revue des Deux Mondes*, and was republished early in 1855. It did not disappoint the high expectations formed of it; but the author had laid himself open to a charge which, whenever it can be colorably sustained, is certain to be disastrous. He had taken many of his leading incidents from an Italian work, *Vittoria Savorelli*, published in 1841, and soon after withdrawn, the incidents contained in which were well known as actual occurrences; and, though something of this was hinted in the book, there was no distinct acknowledgment of it. A hue and cry of plagiarism was got up against A., from which his reputation took some time to recover. His comedy, *Guillery*, brought out in Feb. 1856, at the Théâtre Français, did not make his peace with the Parisians; it was a complete failure, so far as the theatre-going public was concerned, and had to be withdrawn after two representations. A set of stories which he now began to contribute to the *Moniteur*, however—*Les Mariages de Paris*—had a success which more than made up for the savage criticism which he had had to endure, they placed him high in public favor; and since then his career has been a series of successes. *Les Mariages de Paris* was followed by *Le Roi des Montagnes* (1856), *Germaine* (1857), *Les Echasses de Maître Pierre* (1857), *Le Turco* (1866), *L'Infâme* (1867), *Les Mariages de Province* (1868).

In 1859, after a tour in Italy, of a portion of which he contributed a description to the *Moniteur*, A. published a political pamphlet—*La Question Romaine*—which, displaying the same qualities as his early work on Greece, but matured, and wielded for a definite object, and being, moreover, regarded as written with the approval of the emperor of the French, created a sensation throughout Europe. His object was to expose the abuses of the ecclesiastical government at Rome; and numerous answers to his work were made by friends of the papacy. In the following year, he published two political pamphlets, *La Nouvelle Carte d'Europe*, and *La Prusse en 1860*; both of which, being taken as indicative of the emperor Napoleon's leanings, underwent criticism in all parts of Europe. A second work on Rome—*Rome Contemporaine*—appeared in 1861. M. A. was decorated with the Legion of Honor in 1858.

Of late years, he has been producing novels with unabated popularity; and he has also written several slight dramatic pieces, which have been favorably received. It is unnecessary to put down a catalogue of works which are perfectly familiar to those who are interested in French contemporary fiction. In 1864, he published *Le Progrès*, a work of considerable pretensions, in which he discussed at great length, but with his usual liveliness of style, the existing state of society, especially in France, and the methods of improving it. His conclusion was that in France there were needed for progress the liberty of association (for the purposes of production and trade), an amendment of the land-system, a proper distribution of population as between country and town, the absence of police interference in the affairs of private persons, freedom of religious worship, and other similar conditions. In 1868, A. became a leading contributor to the *Gaulois* newspaper. At the outbreak of the Franco-German war in 1870, he accompanied the army of MacMahon to Alsace as special correspondent of the *Soir*, and in 1872 he became editor of *Le XIX<sup>me</sup> Siècle*. He published *Alsace* in 1872. In the same year he suffered a week's imprisonment, for some abusive newspaper articles, from the German authorities, who chose to consider him as a German subject from his being a native of Lorraine.

**ABRACADABRA**, a word said to be of Persian origin, and to designate in that language Mithra, the sun-god. It was, in former times, the most venerated of those magical formulas that were constructed out of the letters of the alphabet, and was supposed to be highly efficacious for the cure of fevers, and especially quartan and semi-tertian agues.

Serenus Sammonicus gives the following directions for its use: Write the letters of the word so as to form a triangle, capable of being read many ways, on a square piece of paper. Fold the paper so as to conceal the writing, and stitch it into the form of a cross with white thread. This amulet wear in the bosom, suspended by a linen ribbon, for nine days. Then go in dead silence, before sunrise, to the banks of a stream that flows eastward, take the amulet from off the neck, and fling it backwards into the water. If you open or read it, the charm is destroyed. The adjoining is one of the principal forms of arranging this mystic word.

**ABRAHAM**, the progenitor of the Israelitish nation. He was a native of Chaldaë, but migrated, with his wife Sarah and his nephew Lot, to Canaan, where he lived a nomadic life, and worshipped the one God, Jehovah, in the midst of the polytheistic Canaanites. The details of the narrative, as given in the book of Genesis, are familiar to every one. A. died at the age of 175 (about 1800 B.C.). Of his two sons, Isaac was the ancestor of the Israelites; and the Arabs claim to be descended from Ishmael, whose mother was Hagar, a bond-woman. Later tradition ascribed to A. a complete knowledge of astronomy and philosophy, the invention of alphabetic writing, the art of interpreting dreams, etc. Even among Mohammedans, A. is reckoned a prophet and the friend of God; and they attribute to him the building of the sacred Kaaba at Mecca.

**ABRAHAM'S BOSOM**, a synonym among the Jews for felicity. In reclining at table, a custom almost universal in the East, the second person's head would be near the bosom of the first one, who might be the host or some more distinguished man. To be in that position to his bosom was to be the preferred friend or guest. While Dives was in torment, Lazarus was in A.'s B.

**ABRAHAM-A-SANCTA-CLARA**, a very eccentric but popular and useful German preacher, was b. 1642, and d. in Vienna 1709. His real name was **ULRICH MEGERLE**, but he is generally known by the name given to him in his monastery. Uncouth puns, coarse expressions, and strange freaks of humor marked his sermons; but beneath their fantastic shells they had good kernels. A. was an honest, faithful, and devoted priest, as was proved by his self-sacrificing conduct during the plague in 1679. Though very severe in his reproof of vice, he was highly esteemed. The singular style of his writings is indicated by their very titles, e.g., *Gack Gack*, i.e., *Wallföhrth Maria Stern in Teza*; *Heilsames Gemisch-Gemisch* (Wholesome Hodgepodge). His collected works amount to twenty vols. (1835). A selection was published in 2 vols. (1846).

**ABRAHAM-MEN**, a class of sturdy beggars who simulated lunacy, and wandered about the country in a disorderly manner; at one time working on the sympathy and at another on the fears of women, children, and domestics. They were common in Shakspeare's time, and, it would seem, existed even as late as the period of the civil wars. The term is a cant one. "An Abram cove," as Decker, in his *English Villanies*, calls one of these mendicants, meant one who personated a "Tom o' Bedlam." He would "disguise himself in grotesque rags, with knotted hair, long staff, and with many more disgusting contrivances to excite pity," but he did not hesitate to live by thieving too, and, when detected pilfering or in any species of depredation, he pleaded the immunities of the real Bedlamite, who was formally permitted to roam about the country when discharged from "Bethlem Hospital." A verbal relic of this class is still preserved in the slang phrase, "to sham Abraham."

**ABRAHAMITES**, or Bohemian deists. Under this name, a number of residents in Bohemia, trusting to the edict of toleration issued by Joseph II., avowed themselves (1782) as believers of the doctrine alleged to have been held by Abraham before his circumcision. As early as the 9th c., a sect of the same name had arisen in Syria, and had denied the divinity of Christ. But the Bohemian deists professed to be followers of John Huss, though they held no Christian doctrine beyond that of the unity of God, and accepted nothing of the Bible save the Lord's Prayer. As they would join neither Jewish nor Christian sects, the emperor refused to tolerate them; and in 1783 expelled them from their native land, and scattered them in various parts of Hungary, Transylvania, and Slavonia, where many were made converts to the Roman Catholic church, while others died as martyrs to their simple creed.

**ABRANTES**, a t. in Estramadura, Portugal, on the Tagus, 70 m. n.e. from Lisbon, in a fine situation. The hill-slopes around it are covered with olive-trees and vineyards, and there is considerable trade in fruit, corn, and oil. The town is strongly fortified, and is an important military position. At the convention of Cintra it was ceded to Great Britain. From this town marshal Junot took his title of duc d'Abrantes. Pop. about 600.

**ABRANTES, DUKE OF.** See **JUNOT**.

**ABRAVANEL**, or **ABARBANEL**, ISAAC BEN JUDAH, b. Lisbon, 1437, d. Venice, 1508; a Jewish rabbi of Spain, who claimed descent from king David. He was remark-

ably learned, especially in biblical literature. In early life A. was employed in financial matters by Alfonso V., but after that king's death he and the other ministers were banished from Portugal and their property was confiscated. In Spain he made a fortune as a merchant, and was in high favor with Ferdinand and Isabella in 1487, but the decree of 1492 banished all Jews from Spain, and A. fled to Naples, where he found royal favor, but was again obliged to fly when Naples surrendered to the French in 1494. He settled last at Venice. Though so much driven about, he wrote many works, and was esteemed one of the ablest men of his time. His writings were mainly in defence and exposition of the Hebrew religion. One of his sons wrote a work in Italian.

**ABRAXAS STONES** are so called from having the word *abraxas* or *abrasax* engraved on them. They are cut in various forms, and bear a variety of capricious symbols, mostly composed of human limbs, a fowl's head, and serpent's body. These gems, whose value and significance have been greatly exaggerated, are common in collections, and are represented as coming from Syria, Egypt, and Spain. It is certain that the use of the name abraxas was at first peculiar to the Gnostic sect of the Basilidians (q.v.); and probably the word, by taking the numerical value of its Greek letters, may signify the number 365, so that there is no need to have recourse to old Persian or Egyptian, as is sometimes done. The Basilidians, however, did not designate by this name the highest deity, but the spirits of the world collectively. At a later period, the doctrines and practices of the sect were carried by the Priscillianists to Spain, whence many of these stones are got. Gnostic symbols were afterwards adopted by all sects given to magic and alchemy; and thus there is little doubt that the greater part of the abraxas stones were made in the middle ages as talismans.

**ABROGATION** of laws is the repealing or recalling of them—as where a statute repeals a previous one. Generally, in England, all statutes, no matter how old, or how unsuited soever to the times, remain in force until they are expressly repealed. But in Scotland a statute may become obsolete and virtually repealed, so that it may not, owing to the lapse of time, be founded on. See **STATUTE**.

**ABRUS**, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, of which the only known species, *A. precatorius*, is a shrub, originally belonging to India, where it is chiefly found in clayey soils, but now not uncommon in the West Indies and other tropical regions. The roots possess properties exactly similar to those of the common liquorice. The seeds are nearly spherical, as large as small peas, of a scarlet color, with a black scar, and are familiar enough to most people in Britain, being used as beads. They are narcotic.

**ABRUZZO**, a district of Italy, was formerly the n.e. corner of the kingdom of Naples, and divided into three parts—Abruzzo Ulteriore I. and II., and Abruzzo Citeriore. These three divisions correspond to the present Italian provinces Chieti, Teramo, and Aquila respectively. The whole district contains about 5000 sq. m., and 920,000 inhabitants. Its chief towns are Chieti, Teramo, Aquila, Sulmona. It forms the wildest and loftiest portion of the Apennines. The streams are numerous, but the only river of any consequence is the Pescara, which flows into the Adriatic. The rent and jagged mountain groups arrange themselves in picturesque shapes, reaching in Il Gran Sasso d'Italia, or "the great rock of Italy," which is the highest of the chain, the elevation of 9800 feet. The highlands slope precipitously on all sides, but especially towards the n.e. shore. The climate of A. is raw in the higher regions; snow rests on the hills from Oct. to April, and on some of the peaks all the year round; but the valleys are extremely fertile, though husbandry is in a wretched condition, and the low, open plains are left without the slightest protection from inundations of the rivers in spring, or means for irrigation in the arid summer. Dense forests of oak and fir clothe the sides of the mountains; at the base, almond, walnut, and other fruit-trees grow abundantly; olives in the deep-lying valleys. Fine cattle pasture in these regions; herds of swine roam through the lofty pine-woods; and the remoter fastnesses are the haunt of bears, wolves, and boars. The chief importance of A. used to be its military position as a defence of the kingdom of Naples. There are few roads into it, so that it is very difficult for an enemy to reach Naples from the n. It is admirably suited for the purpose of guerilla warfare. But the people have ceased to possess a reputation as banditti. No trace of the old spirit which made their ancestors, the Marsi, Sabines, and Samnites so terrible to the Romans, and which in modern times manifested itself in a love of petty plundering, is to be found. They have become a race of rude and simple shepherds, fondly attached to their mountain homes, musical, superstitious, and hospitable, but they are robust and powerful, and during the French invasion of Naples, in 1799, displayed a vigorous courage in opposing the soldiers of the revolution.

**AB'SALOM**, the third son of David, king of Israel, remarkable for his beauty, and for his unnatural rebellion against his father. By popular acts he contrived to win the affections of the people, and then stirred up a formidable rebellion. The adherents of the king having rallied round him, a battle was fought in the forest of Ephraim, in which the rebels were defeated. In the flight, as A. was riding under a tree, his hair caught in the branches, and he was left suspended in which position Joab, the commander of

David's army, thrust him through, contrary to the king's express orders that he should be spared. The grief of David for his loss was excessive. See 2 Sam. c. 18.

**ABSALOM**, Archbishop of Lund. See AXEL.

**ABSCCESS** (*apostema*), a collection of purulent matter formed by disease within some tissue or organ of the body. The process by which an abscess is formed is the following: First, the capillary vessels become overcharged with blood, in consequence of inflammation. From the blood thus made stagnant, or flowing very feebly, a fluid exudes through the walls of the capillary vessels, and, containing a large portion of albumen, becomes pus or purulent matter. This matter, at first contained in the minute interstices of the tissues, gradually dissolves them, and so makes for itself a larger cavity; and frequently, by gradual dissolution of the adjacent parts, works its way either to the surface or to some natural cavity of the body. Pus thus makes its appearance often in a different part of the body from where it was formed. It also occurs that when the purulent matter does not find any outlet, either naturally or artificially, it is gradually dried up or absorbed. In abscesses superficially seated—either in or close under the skin—the early treatment consists chiefly in promoting the formation of pus by the application of moist and warm bandages or poultices. The next step is the removal of the pus. When this is too long delayed, serious disturbance of the organ, or even poisoning of the blood, may ensue. An abscess must be regarded not as a distinct, original disease in itself, but as the result of another disease—inflammation; or as an effort of nature for the removal of injurious matters from the system.

**ABSCISSA**. See PARABOLA.

**ABSENTEE**, a term applied, by way of reproach, to capitalists who derive their income from one country, and spend it in another. It has been especially used in discussions on the social condition of Ireland. As long as Ireland had its own parliament, a great portion of the large landed proprietors lived chiefly in the country during summer, and passed their winters in Dublin; thus spending a large portion of their incomes among their dependents, or at least among their countrymen. The union changed the habits of the Irish nobility and gentry, who were attracted to London as the political metropolis, or were induced, by the disturbed condition of Ireland, to choose residences on the continent. Such Irish landed proprietors were styled "absentees;" and it was argued that their conduct was the great source of Irish poverty, as it drained the resources of the land, or, in other words, sent money out of Ireland. One class of political economists—among them M'Culloch—maintain that, economically viewed, absenteeism has no injurious effect on the country from which the absentee draws his revenue. An Irish landlord living in France, it is argued, receives his remittances of rent, not in bullion, but in bills of exchange; and bills of exchange represent, in the end, the value of British commodities imported into France. The remittance could not be made unless goods to the same amount were also drawn from Britain. Thus, although the landlord may consume, for the most part, French productions, he causes, indirectly, a demand for as much of British productions; and his income goes, in the end, to pay for them. His residence abroad, then, does no harm to the industry and resources of the country at large, although it is admitted that it may be felt as an evil in a particular locality. The truth of this doctrine, however, in its full extent, is disputed. Among other objections to it, it is argued that whatever may be true of the amount actually consumed, all the tradesmen and others who supply the absentee's wants have their profits, and have thus the means of accumulating; and that these accumulations which are thus added to the national wealth of a foreign country would have been added to the wealth of his native country had he been living at home. The result of the controversy would seem to be that absenteeism does, to some extent, act injuriously on the wealth of a country, though it is not true that the whole revenues thus spent are so much clear loss, there being several indirect compensations.—On the evil of absenteeism, in a moral point of view, all are agreed; especially in a country in the condition of Ireland, where nearly the whole wealth is in the hands of extensive landed proprietors, with almost no middle class. The possessors of land have duties to perform which cannot be deputed; the very least of these obligations being that of setting a good example in a neighborhood, and one not less important being that of giving personal aid in effecting local improvements. It is a bad sign of the social condition of a country when its proprietors systematically live abroad, or in great cities away from their estates. The relations between landlord and tenant then become more and more cold and distant; while, too often, the agents of the landlords have no good feeling towards tenants, but strive only to raise as large sums as possible for their principals, and to enrich themselves. But though the evils of such a state of society are evident, it is not easy to propose a sound remedy. Forced residence is opposed to all British ideas of personal liberty. The most likely plan is to make Ireland a more pleasant home for proprietors.

**ABSINTHE**. See LIQUEUR and ARTEMISIA.

**ABSINTHE** (*ante*), or WORMWOOD, spirits prepared from the leaves and flowering tops of *artemisia absinthium*, united with angelica root (*archangelica officinalis*), sweet-flag root (*acarus calamus*), dittany leaves (*origanum dictamnus*), star-anise fruit (*selicium anisatum*), and other aromatics, macerated in alcohol eight days and distilled. The product is an emerald colored liquor, to which anise-oil is added. This is the genuine

French *extrait d'absinthe*, but much of inferior quality is made with other herbs and essential oils, while adulterations are numerous and deleterious. In adulteration the green color is usually produced by turmeric and indigo; but blue vitriol has often been detected. In commerce are two kinds of A., common and Swiss, the latter prepared from highly concentrated spirits, and when genuine is most trustworthy as to herbs used. The chief place of manufacture is Neufchatel. It is mostly consumed in France, but large quantities are exported to the U. S. Absinthe was first used by the French soldiers in the Algerine war (1844-47), mixed in their liquor, as a febrifuge, and they brought the habit to France, where it has become so great an evil that its use is prohibited in both army and navy. Excessive use of A. gives at first a feeling of exhilarated intoxication; the digestive organs are immediately deranged; the appetite destroyed, then raging thirst, giddiness, ringing in the ears, hallucinations of sight and heavy mental oppression, anxiety, loss of brain power, and idiocy succeed each other rapidly. The moderate drinker soon feels muscular twitchings and loss of strength, his hair falls out, his countenance is mournful, and he becomes emaciated, wrinkled, and sallow; lesion of the brain, horrid dreams, gradual paralysis, and death follow in successive order. It is more deleterious and dangerous than brandy or any other strong spirits.

**ABSOLUTE** stands opposed to *relative*, and means that the thing is considered in itself, and without reference to other things. In physics, we speak of the *absolute* velocity of a body—i.e., the rate of its motion through space; and of the *relative* velocity of two bodies—i.e., the rate at which they approach or recede from one another, one or both being in motion. In the language of modern metaphysics, the absolute is the unconditioned, unalterable original—that which is the ultimate cause and ground of the phenomena of the visible world. Absolute, in politics, is applied to a ruler whose authority is unrestricted by constitutional checks.

**ABSOLUTE** (*ante*). Hegel, Cousin, and others use absolute as self-existent or "being" in itself, which is the primitive in thought, the ultimate in science, and the object of immediate intuition; or the infinite, recognized solely as pure being. But the knowledge of an absolute has been held impossible, on the ground that knowing is in itself a relation between a subject and an object; what is known only in relation to a mind cannot be known as absolute. It is therefore said, of an absolute there is no knowledge: first, because to be known a thing must be consciously discriminated from other things; second, because it can be known only in relation with a knowing mind. Discussion of the absolute raises the controversy whether the pure, unconditioned absolute "being" held to by Cousin and some German specialists is real, living being or God, or only a logical abstraction. Gioberti maintains that as the terms used are abstract, the idea they evolve can be only a logical deduction by the mind operating upon its own conception, regardless of space, time, or conditions; that, therefore, the absolute is no real being, but a generalization of physical phenomena, and as far removed from the real and necessary being of the schoolman, from the real, living God, in whom men believe, as nothing is from being something. Kant, while denying the absolute or unconditioned, as an object of knowledge, leaves it conceivable as an idea regulative of the mind's intellectual experience. It is against any such absolute—whether real or conceivable—that Sir William Hamilton and Rev. Henry Mansell have taken ground, the former in his review of Cousin's "Philosophy," and the latter in lectures on religious thought. This, however, is strongly controverted.

**ABSOLUTION**, originally a term of Roman law, signifying acquittal, is now used in an ecclesiastical sense. In the primitive Christian church, its form was this: Members that had given scandal by gross and open sins were excluded from the Lord's supper or from the congregation altogether, and could be readmitted only if they repented and underwent the penance laid upon them by the church. When they had done so, the presbyter, along with the elders, pronounced the absolution in presence of the congregation—meaning that the congregation forgave the offence, on their part, and received the sinner again into their number. Down to the 3d c., the concurrence of the congregation continued to be necessary to absolution. But by the 4th c. it had become a right of bishops to absolve, and the public confession had gradually turned into a private confession before the priest, who now imposed the penance of himself, modified or remitted it, and then absolved. Absolution had not, as yet, been extended to any but open and gross sins; but when the dominion of the hierarchy over men's minds had reached its height, and the fourth Lateran council (1215) had made auricular confession, at least once a year, obligatory, confession and its attendant absolution were extended to all sins whatever; and the absolution was made to convey, not merely, as before, forgiveness on the part of the church, but forgiveness in the sight of God. The formula, *Deus* or *Christus absolvit te*, which was used till the 12th c., was changed into *Ego absolvo te*; thus ascribing to the priest the power to forgive sins in the sight of God. This is still the received theory of absolution in the Roman Catholic church, sanctioned by the council of Trent, and grounded on John xx. 21.—The Protestant churches ascribe to the absolution of the clergy only a declarative and not an exhibitiv power; on the ground of repentance, it announces and assures forgiveness on the part of God, but does not impart it. See **PENANCE**.

**ABSORBENTS**. See **LACTEALS** and **LYMPHATICS**.

**ABSORPTION** (in Botany). It is believed that plants absorb carbonic acid gas, and also to some extent fluids, by their leaves and other aerial organs; and it is supposed that this absorption takes place principally through the *stomata* of the leaves (see *LEAVES*), and both by the upper and under surface of the leaf, in some plants by both surfaces indifferently, in others much more powerfully by the one surface or the other. But plants principally depend upon their roots for nourishment, and it is at the extremities of their fibrils that absorption takes place most rapidly, according to a peculiar process to which has been given the name of *ENDOSMOSE* (q.v.).

**ABSORPTION** (*ante*). All the membranes and tissues of living bodies have the property of absorbing fluids—a property that continues after death and until decomposition. In absorptions in animal organisms fluids do not penetrate tissues mechanically through orifices, for the existence of such orifices, or open mouths, once taken for granted, has been disproved by late microscopic research. It may therefore be surmised that absorption is equivalent to molecular combination of organs or tissues and fluids or things absorbed. Animal substances differ in absorbing power with difference in liquids, taking, for example, 100 parts of clear water and only 65 of brine, and less if the brine be stronger; and a tissue taking 100 parts of brine will not receive a quarter as much of an oily liquid. An idea of differences may be got from Chevreul's table:

100 Parts of	Absorb in 24 Hours.	Parts of Water.	Saline Solution.	Oil.
Cartilage.....	"	231	125	
Tendon.....	"	178	114	8.6
Elastic ligament.....	"	148	30	7.2
Cartilaginous ligament....	"	319		8.2
Cornea.....	"	461	370	9.1
Dried fibrine.....	"	301	154	

Activity of absorption varies with the freshness of the membrane, being most the soonest after separation from the principal parts; and varies also with pressure, motion, and temperature. *Absorption of oxygen* by the blood in the lungs is apparently instantaneous, the change in color from blue to red as soon as it arrives at the pulmonary vessels showing the action of the gas it has taken from the atmosphere. This rapidity of absorption is due to the diffusion of the blood in a great number of minute channels, whereby the vascular and absorbing surfaces are brought into contact over a large surface; and to the incessant motion of the fluid, by which its effects become perceptible at the earliest possible time. Claude Bernard found that if a solution of iodide of potassium were injected into the duct of the parotid gland on one side of a living animal, the saliva discharged by the corresponding gland on the other side almost instantly afterwards contained iodine. In a measureless instant, therefore, the iodine was taken up by the glandular membrane on one side, absorbed by the blood, carried to the heart, absorbed from the blood by the glandular membrane on the other side, and furnished to the saliva. It is by this process of absorption that the elements of nutrition are taken from the intestines and conveyed to the tissues they are to nourish; the bones absorb much calcareous matter from the blood, cartilages less, and muscles less still; the brain takes more water than does muscle, and muscle more than bone. Late medical schools agree that the action of drugs and poisons takes the same course. Opium dissolved by the liquids of the stomach is absorbed by the membranous lining, taken away by the blood and distributed well through the body; at the brain it is absorbed by the cerebral substance, acts upon the nervous matter, and produces narcotism or insensibility, and the brain, through its nervous ramifications, affects the whole body. The quickness of absorptive action is shown in using hypodermic injections; almost before the syringe has punctured the skin of the forearm a severe pain in the foot is sensibly relieved. *Absorption of Gases by Solids*.—Solid metals will sometimes absorb gases. Gaseous hydrogen has been found in newly-fallen meteorites, obtained perhaps while passing through nebulae. Palladium will take 643 times its own volume of hydrogen; silver and platinum absorb oxygen; titanium takes nitrogen; hydrogen will pass through platinum and red-hot iron like water through a sieve. Liquids rapidly absorb gases; water near the freezing point contains in volume 4 per cent of oxygen and 2 per cent of nitrogen, equal to 4 oxygen in 6 parts, while air has only 1 oxygen in 5 parts. At the temperature of 70° the power of absorption is reduced to one half, and at boiling nearly all absorbed gases are thrown off. Under low pressure less and under high pressure more gas can be taken in. Solutions of neutral salts absorb about the same amount as water, except sulphates; acids absorb least, dilute sulphuric taking less than a quarter of one per cent in volume. *Absorption of Heat*.—The capacity of substances for absorbing heat varies widely; it is least in smoothly polished or bright and light colored objects; greatest in dark colored and rough surfaces. It is found in regard to color, that more depends on the coloring material than on the color itself. When the heat-giving body is non-luminous, color is without influence, but great in case of luminous bodies. There are also great differences in the absorbing power of transparent substances; rock-salt absorbs only 8 per cent of the heat passing through with the light, fluor spar 25 to 50 per cent, Iceland spar and glass 60 per cent, alum 90 per cent, and ice 94 per cent. These substances transmit the heat which they do not absorb. *Absorption of Light* is the process which takes place when light enters an imperfectly transparent medium, a portion of the light being stifled or spent in producing some physical effect, while the remainder is either directly transmitted or emerges after one or more internal reflections.

A body absorbing all the light that reaches it would be perfectly black and wholly invisible; but in point of fact the blackest object reflects some light from its surface. A body absorbing none but reflecting all light would be perfectly white. In general the different parts of white light are absorbed with unequal energy, and thus the light which escapes absorption is colored. In most cases the colors of natural bodies are occasioned in this way. Transparent substances absorb light in varying degrees, and in many of them an elective absorption takes place; glass, gems or liquids absorb certain colors and let others pass, those which pass determining the color of the substance. Occasionally a color complementary to one absorbed is reflected, as red rays transmitted from red aniline and green rays reflected. Certain crystals are polychromatic, showing changing colors as light passes through in different directions.

**ABSTEMIUM**, the name given to those who could not partake of the sacramental cup because of their natural aversion to wine. Calvinists allowed them to touch the cup with the lips without drinking, which Lutherans considered profanation. Later, and in America especially, there has been a division as to the propriety of using wine in the communion, the radical opposers of alcoholic drinks urging the use of the unfermented juice of the grape.

**ABSTINENCE.** See **FASTING**.

**ABSTINENCE SOCIETIES**, associations for the promotion of abstinence from all kinds of alcoholic liquors, and the members of which usually receive the designation of abstainers or teetotallers—this last phrase inferring an utter and uncompromising abstinence, or at least that the only exception shall be for sacramental and medical purposes. Abstainers usually take a pledge or vow to that effect; the ground of their abstinence from alcoholic liquors being that they are injurious to, or at least no way promotive of, health, and that from the great social evils of intemperance it is important to set an example of entire abstinence. A. S. exist in great numbers in North America and the United Kingdom. In the early growth of this remarkable social movement, A. S. were called temperance societies, and under that head the subject will be treated in its various forms of development.

**ABSTRACTION** is that intellectual process by which the mind withdraws (*abstraho*) some of the attributes of objects from the others, and thinks of them to the exclusion of the rest. The abstract is opposed to the concrete. John, William, my brother, form concrete images in my mind, each with a multitude of attributes peculiar to himself. But they have also certain attributes common to them and to all individuals of the race; I can overlook the others and attend to these, and thus form a notion or conception which is called *a man*. Man is, therefore, an abstract notion, the word connoting, as it is called, a certain though not very well-defined number of attributes. With the exception of proper names, all nouns are thus abstract. There are degrees, however, in abstraction. The abstract notion *animal* rises above that of *man*, embracing all men and innumerable organized beings besides. An *organized being*, again, is a still higher stage, and embraces both animals and plants. Being, time, space, are among the highest abstractions. The higher abstractions rise, the fewer attributes are implied or connoted in the name, hence the propriety of the phrase, *empty abstractions*. On the other hand, the number of objects to which the name is applicable increases; and thus reasoning in abstract terms has the advantage of being general, or extensive in its application. But such reasoning is apt to become vague and fallacious, unless constant regard is had to concrete instances. Abstract language is best adapted for scientific exposition; concrete for graphic and poetical effect.—**ABSTRACT** in Arith. is applied to numbers considered in themselves, and without reference to any objects numbered; thus 7, 20, are abstract numbers; but 7 ft., 20 horse, are concrete numbers.

**ABSURDUM**, **REDUCTIO AD**, the method of proving a truth by showing that to suppose the proposition untrue would lead to a contradiction or absurdity.

**ABSYNTHIUM.** See **WORMWOOD**.

**ABT, FRANZ**, b. 1819, in Saxony. He began to study theology, but left it for music, and at 22 was musical director at Zürich; 11 years later, second musical director at the Brunswick court theatre, and promoted by the grand duke in 1855, to be first director. A. is a composer for piano, orchestra, and voice, but best known as a song writer, succeeding especially in two-part and four-part songs for male voices. He visited the U.S. in 1872.

**ABU** or **BU**, Arab for "father," is prefixed to many Arabic proper names, as the equivalent syllable *Ab* is prefixed to Hebrew names: ex., Abu-bekr, "father of the virgin" (Aysha). But *Abu*, like *Ab*, often signifies merely possessor; as in Abulfeda (possessor of fidelity), "the trusty," Abner, "the brilliant"—literally, "father or possessor of light."

**ABU**, a mountain of India, in the territory of Serolie, in Rajpootana, rising far above any other of the Aravulli ridge, and said to be about 5000 ft. above the sea. The base is broad, its circuit being estimated at 40 to 50 m.; the summit is very irregular, and divided into many peaks. It is a celebrated place of pilgrimage, especially for the Jains, who have a magnificent group of four temples at Dilwara, about the middle of

the mountain, one of which is described as "the most superb of all the temples in India." Before it is an equestrian statue of the founder, Bimul Sah, a Jain merchant of Anhwara. All the temples exhibit symptoms of decay. The summit of A. is about 40 m. n.e. from the British cantonment of Deesa, and it has lately begun to be used as a sanatorium.

**ABU-BEKR**, "Father of the virgin" Ayesha, the wife of Mohammed, was a man of great influence in the Koreish tribe, and in 632, when Mohammed died, was made the first caliph or successor of the prophet. After defeating his enemies in Arabia, and warring successfully against Babylonia, Syria, and the Byzantine emperor Heraclius, Abubekr d. 635 A.D., aged 63, and was buried at Medina, near the remains of Mohammed and his wife Ayesha (q.v.).

**ABULFARAJ** (Lat. *Abulfaragius*), called also Barhebraeus—i.e., Son of the Hebrew, as being by birth a Jew, though afterwards a Christian—was b. at Malatia, in Armenia, 1226, and became so distinguished for his knowledge of the Syriac, Arabic, and Greek languages, and of philosophy, theology, and medicine, that he was called the phoenix of the age. At the age of twenty, he was made bishop of Gula, and afterwards of Aleppo; and rose to the rank of maphrian, the highest dignity among the Jacobite Christians next to patriarch. Of his numerous Syriac and Arabic writings, most of which yet lie buried in the library of the Vatican, the best known is a *Chronicle*, in Syriac, of universal history from Adam down to his own time. The first part of it was published at Leipsic in 1789, the rest (3 vols.) at Louvain in 1872-4. A. himself abridged this work in Arabic, under the title of *History of the Dynasties* (edited by Pococke, Arab and Lat., Oxf. 1663). Among his writings of a theological kind may be mentioned his *Magazine of Mysteries*, being a commentary on the Syriac version of the Bible.

**ABUL-FAZL**, Vizier and historiographer of Akbar, the great Mongol emperor; b. about the middle of the 16th c. His work is *The Book of Akbar*, in two parts: the first part being a complete history of Akbar's reign, and the second an account of the religious and political constitution and administration of the empire. The style is excellent, and the second part is of unique and enduring interest. An English edition, now very rare, was published in 1783-6, and reprinted in London. A. d. by the hand of an assassin, while returning from a mission to the Deccan, in 1602.

**ABULFEDA**, a Moslem prince, known as a writer of history, was b. 1273 A.D., at Damascus; and during his youth distinguished himself in several campaigns against the Christian kingdom founded by the crusaders. From 1310 to the time of his death, he ruled over the principality of Hamat, in Syria, was a true ally of the sultan, visited Egypt and Arabia, patronized literature and science, and d. in 1331. He left several important works in Arabic, among which are his annals, the earlier portion of which has been edited by Fleischer, under the title of *Historia Anteislamica* (Leip. 1831), and the rest by Reiske, in his *Annales Moslemici* (Copenh. 1789-94). This work was in great part compiled by A. from earlier Arabic authors, and is a valuable source of history, especially of the Arabic empire. He also wrote a geography, which has been edited, with a French translation, by Reinaud and De Slane (Par. 1848), and by Reiske (Dresden, 1842).

**ABUL-GHA'ZI-BAHA'DUR**, 1605-63; a khan of Khiva (of the race of Genghis-khan), who abdicated in favor of his son, and devoted his time to writing a history of the Mongols and Tartars, a valuable work, which has appeared in German, French and Russian.

**ABUL-KA'SIM**. See **ALBUCASTS**, *ante*.

**ABUSHEHR** (variously written Bushehr, Bushire, in Pers. Bendershehr) is the name of a seaport on the e. coast of the Persian gulf. It is situated at the extremity of a peninsula. The district is liable to be devastated by earthquakes and the simoom, and is deficient in water; but the situation is so favorable for commerce that the trade is valued at £600,000 a year (of which three fourths represent imports). It is the land terminus of the Indo-European telegraph line; the head-quarters of the English naval squadron in the Persian gulf; and a chief station of the British Indian Steam Navigation Co. The exports are horses, fruits, shawls, pearls, silk, rose-water, asafetida, copper, gall-nuts, etc.; imports, sugar, indigo, iron, cotton goods, etc. Pop. nearly 20,000.

**ABU-TEMAM**, 787-46; an Arabic poet; b. in Syria; a prolific writer, and much praised. The Arabs said, "No man ever dies whose name has been praised in the verses of Abu-Temam." He made three collections of Eastern poetry, one of which, the *Hamasa*, is praised by Sir Wm. Jones.

**ABUTMENT**, in arch., is the part of a pier or wall from which an arch springs, and which resists the outward thrust. The term *impost* is used when the arch is a semicircle, so that the pressure is vertical. In reference to a bridge, the abutments are the walls adjoining the land, which support the ends of the roadway, or the extremities of the arch or arches.

**ABU-YÛ'SÛF-YAKÛB**, called **AL-MANSÛR**, or "The Victorious," 1160-98; the fourth sultan of the Almohade dynasty in Africa and Spain. His father was killed at the siege of Santarem, 1184; and as soon as he had quelled certain insurrections in Morocco, A. invaded Spain and carried off to Africa 40,000 captives. In a second foray he cap-

tured Torres and Silves, in Portugal; and, in a third venture, defeated the Christians under Alphonso III., near Valencia, and captured Madrid and four other important cities. He died in Morocco.

**ABYDOS**, a t. in Asia Minor, situated at the narrowest part of the Hellespont, opposite Sestos. It is celebrated as the place whence Xerxes and his vast army passed into Europe in 480 B.C.; also as the scene of the story of Hero (q.v.) and Leander. In the later times of antiquity, the people of A. were reproached for their effeminate and dissolute manners.—There was another ABYDOS in Upper Egypt (Thebais), on the left bank of the Nile, and on the main route of commerce with Libya. Even in the time of Strabo, this t. was in ruins. Here the remains of the Memnonium and of a temple of Osiris are still remarkable. In the former, W. J. Bankes, in 1818, discovered the celebrated tablet of A., bearing, in hieroglyphics, a genealogy of the eighteenth dynasty of the Pharaohs. It is now in Paris, and copies have been published.

**AB'YLA and CAL'PE.** See **HERCULES, PILLARS OF, ante.**

**ABYSS**, used in Scripture to denote the ocean, or the under world, and for Hades, or the place of the dead, but indicating especially the place where sinful souls were imprisoned. In the A. were imprisoned the giants of old; and there the prophets tell us the kings of Egypt, Tyre and Babylon were punished for pride and cruelty. The A. was the place dreaded by evil spirits, and to which they begged the Savior not to send them. A vast, boundless and chaotic region of darkness is common to most mythologies, and is called the A., or by some name of similar signification.

**ABYSSINIA**, called Habesh by the Arabs, is the large tract of highlands in the e. of Africa. From the Red sea, on the n.e., it rises in terraces towards the s.w. Between the highlands and the Red sea lies a flat tract called Adal, narrow at the n. (in lat. 50° 30'), and widening to the s. The plains of Nubia and Kordofan form the boundaries on the n. and w., while the southern limits are not well known. The total area is about 200,000 sq. m., and the population 3,000,000 to 4,000,000. The country consists of high tablelands, intersected by deep ravines formed by the rivers, and steep sandstone terraces. Numerous mountain-chains, mostly of volcanic origin, rise above the table-lands: the highest are the mountains of Samen or Samien, rising to about 15,000 ft. above the sea-level. Some of the plains have an elevation of from 7 to 10,000 ft. A. gives birth to numerous rivers, the largest of which are the Abai or Nile (Bahr-el-Azrek or Blue river); and the Takkazie, an affluent of the Nile. In the s. is the Hawash—from which the country takes its name—which flows eastward into the salt-lake of Assal in Adal. The largest lake is that of Tzana or Dembea, through which the Abai or Blue Nile flows. The climate in the elevated tracts of Abyssinia is temperate and salubrious; in the low tracts along the coast, and in the n. and n.w., the heat is excessive and the climate noxious. On the whole, A. is a country of great fertility; but, like the climate, the productions of the soil vary greatly with the different degrees of elevation. Wheat and barley are cultivated, also maize, the grains called teff (*Poa Abyssinica*) and tocusso (*Eleusine tocusso*), various leguminous plants, cotton, coffee, sugar-cane, tobacco, etc. The coffee-plant grows wild. Among wild animals, the lion, leopard, hyena, wolf, jackal, elephant, buffalo, rhinoceros, and zebra are found.

The people of A. belong mostly to the Shemitic race, and resemble the Arabs both in physical characteristics and structure of language. See **ETHIOPIA**. The ethnology of the country is variously given by different authorities. According to Rüppell, there are three principal races. The aboriginal Abyssinians, inhabiting the greater part of Amhara, and numerous also in Tigré, are of middle size, with oval faces, lips not thicker than those of Europeans, pointed noses, and straight or slightly curled hair. In this race he includes the Falashas, or Jews, the Gamant, and the Agows. A second race, abounding most in the n. of Tigré, have thick lips, noses blunt and somewhat curved, and thick hair verging on wooliness. The third are the Gallas, inhabiting the s. of Shoa and the regions w. of lake Dembea and the Abai; a large-bodied race, round-faced, short-nosed, with a depression between the nose and brow, deep-set lively eyes, and thickish lips. The color of these races is brown of various shades. The only negroes in A. are slaves from the country of the Shangallas, to the w.

The oldest accounts of the Abyssinians are full of fables, but seem sufficient to prove that they attained some degree of civilization even in remote antiquity. Christianity was introduced about the middle of the 4th c., and soon prevailed extensively. Axum was at that time the capital. Two centuries later, the Abyssinians were powerful enough to invade Arabia, and conquer a part of Yemen. In the subsequent struggles against the invading Moslem, the coast-land Samhara and the country of Adal were lost. In the 10th c., a Jewish princess overthrew the reigning dynasty, the surviving representative of which fled to Shoa. After three centuries of confusion the empire was restored under Icon Amlac, and some progress was made in improvement. Early in the 15th c., the Abyssinians entered into close relations with the Portuguese, by whose assistance the empire was saved, in 1540, from falling into the hands of the invader Granie, sultan of Adal. The southern provinces, however, were lost, and the seat of empire was removed from Shoa to Gondar. Under the influence of the Portuguese missionaries, the royal family adopted the Roman Catholic faith; and the old Coptic church was formally united to the see of Rome. The people and ecclesiastics obstinately resisted the innova-

tion; the emperor gave way; and ultimately, in 1632, the Romish priests were expelled or put to death. In consequence of the commotions thus excited, the monarchical power declined, while that of the governors of provinces greatly increased, and indeed became almost absolute. The later history of A. is given under the article THEODORE. The political divisions of the country are subject to continual alteration, but the following are the most important: 1. The kingdom of *Tigré*, extending between the river Takkazie or Bahr-el-Aswad (Black river), and the mountains of Samen on one side, and the district of Samhara on the other. Its chief towns are Antalo and Adowa. 2. The kingdom of *Gondar* or *Amhara*, extending on the w. of the Takkazie and the Samen mountains. The capital, Gondar, is situated in the n.e. of the plain of Dembea or Gondar, at an elevation of 7420 ft. 3. The kingdom of *Shoa* (including *Efat*), lying s. of Amhara and separated from the Galla tribes by the Hawash. This is, by all accounts, the best organized and most powerful state now existing in A. The capital, Ankobar, at an elevation of 8198 ft., contains from 8000 to 10,000 inhabitants, and enjoys a delightful climate. The Gallas, a savage but enterprising race, effected a settlement in the s. of A. in the 16th c. They inhabit the whole of the eastern part of tropical Africa. Several of their tribes have been modified in character and customs by conversions to Mohammedanism, and have founded kingdoms—such as *Enarea*, one of the highest mountain countries of Africa, and rich in produce; *Kusha*, on the river Goshob, where the slave-trade is actively carried on by the Portuguese; and several smaller independent states of which little is known.

In consequence of invasions and civil warfare, the present social and political condition of A. is very unfavorable. The kingdom of Shoa is in better circumstances than the other states. Though Christianity is still the professed religion of the majority of Abyssinians, it exists among them only in its lowest form, and is little more than ceremonial. Their church is national and independent, but the visible head, or *abuna* ("our father") is ordained by the Coptic patriarch of Alexandria. The doctrines of the Abyssinian coincide with those of the Coptic church, especially in the monophysite heresy; but several peculiar rites are observed, including circumcision of both sexes, and observance of the Mosaic laws respecting food, etc.; love-feasts, and adult baptism. The oldest Abyssinian churches are hewn out of rocks. The modern churches are mostly small, round, or conical buildings, thatched with straw, and surrounded by pillars of cedar. Statues and bas-reliefs are not tolerated in churches, but paintings are numerous. The state of manners and morals in A. is as low as might be looked for in a country so long a prey to anarchy and violence. Human life is lightly valued, the administration of justice is barbarously negligent and corrupt, and the marriage-bond is tied and loosed with extreme facility. The land generally yields at least two crops annually; but the agriculture is miserable, and the condition of the lower classes proportionally wretched. Among fruits, the fig is the most plentiful. Wine is used only for the Eucharist; the common drink is *bouza*, a kind of sour beer, made from the fermentation of bread. The manufactures of A. are rude, but sufficient, with a few exceptions, for the wants of the natives; cotton stuffs and leather goods are the staple articles. The foreign trade is carried on principally through Massowah; the chief exports being slaves, gold, butter, musk-horns, wax and ivory.

A. has recently become better known to us through the visits of missionaries, scientific travelers, etc., and the British Expedition of 1867-8. See the travels and journals of Bruce, Lord Valentia, Salt, Ritter, Gobat, Isenberg and Krapf, Ruppell, Parkyns, Plowden, Markham, and Blandford; the report of the French scientific commission (1845); contributions of MM. d'Abbadie to *Journ. Asiat.*, and of Beke and Kirk in *Journ. of Roy. Geogr. Soc.*; *Record of the Expedition to A.*, by Major Holland and Captain Hozier. See THEODORE.

**ACA'CIA**, a genus of plants of the natural order *Leguminosæ*, sub-order *Mimosæ*. The genus *A.* differs from *Mimosa* in the greater number of its stamens (10-200), and in the want of transverse partitions in the bivalvular legumes. The acacias are diffused over all quarters of the globe except Europe. The greater number of them have a singular appearance, because of the leaf-stalks spreading out in a leaf-like form (*phyllodium*); while the leaflets are more or less stunted in appearance, and frequently are altogether absent. Other species have bipinnate leaves, with a great number of leaflets, and are extremely beautiful. Many are of great importance in an economical point of view, because of the juice which flows from them, which, when inspissated, becomes an article of commerce under the name of gum (q.v.). The species called *A. gummifera*, *A. seyal*, *A. ehrenbergii*, *A. tortilis*, *A. nilotica*, and *A. vera*, natives of Africa, produce gum arabic, also *A. speciosa* and *A. arabica*, natives of the south of Asia. *A. arabica* is called the Babul-tree in India, and its gum, babul. A gum similar to gum-arabic is produced by *A. decurrens*, *A. mollissima* (the silver wattle), and *A. affinis* (the black wattle), in New Holland, and by *A. karroo*, at the cape of Good Hope. Gum senegal is the produce of *A. verec* and *A. adansonii*, natives of the western coast of Africa. Yet *A. verec* is also said to yield true white gum-arabic. Catechu (q.v.) is obtained from the wood of *A. catechu*. The astringent bark and pods of some species are used for tanning. The bark of *A. arabica* is administered in India as a powerful tonic medicine. The pods of *A. concinna* form an article of commerce in India, its seeds being saponaceous and used in

washing. A decoction of the pods of *A. arabica* is sometimes used in the same way. A considerable number of species afford useful timber. The flowers of many species are fragrant. A number of species from New Holland and other countries have been introduced into the south of Europe. Some are of frequent occurrence in greenhouses in Britain; and a few of the Australian species succeed tolerably in the open air in the south of England. The foliage of the acacias with bipinnate leaves shows a peculiar sensitiveness to changes of weather; when a thick cloud obscures the sun, the opposite leaflets close together, and so remain till the sun reappears. The locust-tree of North America (*Robinia pseud-acacia*) is often called *A.* both in Britain and upon the continent of Europe. Other species of *robinia* also receive the same name. See LOCUST-TREE and ROSE *A. Flores acaciæ* (*A.* flowers) is an old medical name for sloe flowers.

ACADEMUS, a hero of Athens, whose name is said to be perpetuated in "Academy" or "Academia," the grove in which Plato established his school. *A.* is recorded as having informed Castor and Pollux of the place where their sister Helen was hidden.

ACADEMY, a name originally applied to the philosophical school of Plato, and derived from the place in which that philosopher was accustomed to meet and converse with his pupils. This was a garden or grove in the suburbs of Athens, said to have once belonged to the hero Academus, and by him to have been presented to the citizens for a gymnasium. The spot is at this day known under the name of *Akadimia*. The variations of doctrine among the successors of Plato gave rise to the distinctive titles of *Old*, *Middle*, and *New A.* The first is applied to the philosophic teaching of Plato himself and his immediate followers; the second, to that modification of the Platonic philosophy taught by Arcesilaus (q.v.); and the third, to the half-skeptical school founded by Carneades (q.v.).

In its common English acceptance, the word academy is loosely applied to any species of school which professes to communicate more than the mere elements of instruction. This, however, though perhaps more in affinity with the original application of the term, must be regarded as an abuse of its more general and strict acceptance in modern usage, as signifying a society of savants or artists, established for the promotion of literature, science, or art. The first institution in ancient times that seems to merit the name, in this sense, of academy, was the celebrated *Museum* founded at Alexandria in the 3d c. B.C. by Ptolemy Soter, which concentrated in that intellectual capital all that was most eminent in science, philosophy, poetry, and criticism. After this model, the Jews, and, at a later period, the Arabians, founded numerous institutions for the promotion of learning. During the middle ages, with the exception of the Moorish institutions at Granada and Cordova, in which poetry and music formed prominent subjects of study, we find no thing corresponding to the modern idea of an academy, save the learned society established in his own palace, at the suggestion of his teacher Alcuin, by Charlemagne. This association was dissolved by the monarch's death; and not till the middle of the 15th c., when the conquest of Constantinople drove many learned Greeks to seek an asylum in Italy, do we find any trace of a similar institution. Under the enlightened patronage of Lorenzo and Cosmo de' Medici, the lovers of Greek learning and philosophy were united in the bond of a common pursuit, and zealously labored to revive the long extinguished light of classic literature. After the decline of the Greek and Platonic academies of Florence, there arose institutions of a more comprehensive character, the example of which spread from Italy throughout all the states of Europe.

Academies may be divided into those established for general ends, and such as contemplate specific objects. The members are usually classified as *Ordinary*, *Honorary*, and *Corresponding*. The results of their labors in their various departments are reported at the periodic meetings, and printed in the records of the academy. Prizes are generally established as the rewards of distinguished merit in original discovery, or excellence in the treatment of subjects proposed for competition. Among general academies, deserving of mention in the first place is the *A. of Sciences*, at Paris, established by Colbert in 1666, and now a branch of the *Institut de France* (see INSTITUT). The first scientific academy founded in modern times was the *Academia Secretorum Naturæ*, established at Naples in 1560, and afterwards put down by a papal interdict. It was succeeded by the *A. of the Lincei*, founded at Rome by prince Ceci, which attained distinguished success. Galileo was one of its members. Subsequently arose the *A. del Cimento*, at Florence, and the *A. degl' Inquieti*, of Bologna, afterwards incorporated into the *Accad. della Traccia*, and finally, in 1711, merged in the Institute of Bologna, or Clementine *A.*—The *Berlin A. of Arts and Sciences*, founded in 1700 by Frederick I. was in 1710 divided into four sections: 1. Physics, medicine, and chemistry; 2. Mathematics, astronomy, and mechanics; 3. German language and history; 4. Oriental literature, in special connection with missions. The first president was Leibnitz, whose extraordinary versatility of genius qualified him for a leading place in all its departments. Under the great Frederick, new life was infused into the academy by the encouragement offered to learned men of all countries to settle at Berlin. Maupertuis was now appointed president, and the academy was reorganized under the four classes of physics, mathematics, philosophy, history and philology. The public meetings are held twice a year. The transactions did not appear regularly till after 1811. They were formerly published in French, but

now in German.—The *Imperial A. of Sciences of St. Petersburg* was planned in 1724 by Peter the great, with the advice of Leibnitz and Wolf. It was established in the following year by Catherine I., and liberally supported by the empress: fifteen members received pensions as professors of various branches. Of these were Wolf, Bülfinger, Nicolas and Daniel Bernouilli, and the two De Lisle. After various fluctuations, the academy attained a position of high eminence and utility under the patronage of Catherine II. Among the most important results of her liberality are the travels and researches of such men as Pallas and Klaproth. The academy is still composed of fifteen salaried members, besides a president and director, and four pensioned supernumeraries, who attend the meetings and succeed to the vacant chairs. It possesses an extensive library and a very valuable museum. The first series of its transactions (1725–47) bears the name of *Commentarii*; the second (1748–77), of *Novi Commentarii*; the third (1777–82), of *Acta*. Up to this date, they were written in Latin; thenceforth in Latin or French. From 1783 to 1795, they are called *Nova Acta*; from that time to the present they are entitled *Memoires*.—The *A. of Sciences at Stockholm*, founded in 1739, consisted at first of six members, one of whom was the celebrated Linnæus. It received a royal charter in 1741, but no endowment. Its publications, since 1779, are distinguished as *New Transactions*. Papers on agriculture are separately published, under the title of *Æconomica Acta*. In 1799, it was divided into six classes: 1. Political and rural economy, 15 members; 2. commerce and mechanical arts, 15; 3. Swedish physics and natural history, 15; 4. foreign physics and natural history, 15; 5. mathematics, 18; 6. history, philology, and fine arts, 12. The resident members preside in rotation, during a term of three months: the transactions appear quarterly. At the annual meeting in April, prizes are distributed.—The *Royal A. of Sciences at Copenhagen* owes its origin, like the last mentioned, to six learned men, employed by Christian VI. in 1742 to arrange his cabinet of medals. In 1743, the king, on the recommendation of count Holstén, their first president, took the academy under his protection, endowed it, and ordered that natural history, physics, and mathematics should be embraced within the sphere of its operations, at first limited to the national history and antiquities. The academy's transactions are in Danish; some of them are translated into Latin.—The *A. of Sciences of Mannheim* was founded in 1755 by the elector-palatine Karl Theodor, and divided into the sections of history and physical science; the latter was subdivided in 1780 into physics proper and meteorology. The transactions under the two former heads are published under the title of *Acta*; the meteorological memoirs are entitled *Ephemerides*.—The *A. of Sciences of Munich* was founded in 1759. Soon after the erection of Bavaria into a kingdom, it was reorganized on a very extensive footing, under the presidency of Jacobi. Its memoirs are published under the title of *Abhandlungen der Bayerischen Akademie*.—The *A. of Lisbon*, established by queen Maria in 1779, numbers 60 members, viz., 24 ordinary, and 36 honorary and foreign; and is divided into three sections: 1. natural science; 2. mathematics; 3. Portuguese literature. It is liberally endowed by government, and has a library, museum, observatory, and printing-office. Its *Memorias* have appeared since 1787. The *Royal Irish A.* dates its origin from 1782, when a number of gentlemen, chiefly connected with the university of Dublin, associated themselves for the pursuit of science, history, and literature. The plan of the society was afterwards extended. The first volume of its transactions appeared in 1788.—The *American A. of Arts and Sciences* was established at Boston in 1780: it had previously existed in another form, the original institution being due to Franklin. The first volume of its transactions was published in 1785.—The *A. of Sciences at Vienna* was founded in 1846. It is divided into the sections of history and philology; mathematics and natural science; philosophy, political economy, and medicine. It published *Reports* of its meetings since 1848, and since 1850, *Memoirs*.

Among the academies established for the cultivation of particular departments of knowledge, are the following: 1. **LANGUAGES.** The *Accademia della Crusca*, or *Accademia Furfuratorum*, was founded at Florence in 1582, chiefly for the purpose of promoting the purity of the Italian language; whence its somewhat fantastic designation—*crusca* signifying chaff or bran. It first drew attention by its attacks on Tasso. Its principal service has been the compilation of an excellent dictionary, and the publication of correct editions of the older Italian poets. A new edition of this dictionary is at present in preparation, but from the slow rate of its progress it is calculated that many centuries must elapse before its completion. For an account of the *Académie Française*, instituted in 1629, as a private society, see *INSTITUT*.—The *Royal Spanish A.* was founded at Madrid in 1714, by the duke of Escalona, for the cultivation and improvement of the national language, in which it has done good service, particularly by the compilation of a Spanish dictionary. A similar institution was founded at St. Petersburg in 1783, and afterwards united to the Imperial A. At Stockholm, a similar academy was established in 1786; and at Pesth (for the cultivation of the Magyar language) in 1830.—2. **ARCHÆOLOGY.** At the head of antiquarian institutions stands the *Académie des Inscriptions*, founded at Paris in 1663, by Colbert. See *INSTITUT*. For the elucidation of northern languages and antiquities, an academy was founded in 1710 at Upsala, in Sweden; a similar institution was established at Cortona, in Italy, in 1727. Both have issued valuable works. The *A. of Herculaneum* was founded at Naples in 1755, by the marquis of Tanucci, for the elucidation of Herculanean and Pompeian antiquities. Its publications, commencing

in 1775, bear the title of *Antichità di Ercolano*. An academy for the investigation of Tuscan antiquities was established at Florence in 1807; and at Paris, in 1805, a Celtic A. for the elucidation of the language, history, and antiquities of the Celts, especially in France. This society changed its name, in 1814, to *Société des Antiquaires de France*.—3. HISTORY. The *Royal A. of Portuguese History* was founded at Lisbon, in 1720, by John V. At Madrid, in 1730, a learned association was formed for the elucidation of Spanish history. It was constituted an academy in 1738, by Philip V. It has published editions of Mariana, Sepulveda, Solis, and the ancient Castilian chronicles, some of which had never before been printed. A historical academy has existed for some time at Tübingen.—4. MEDICINE. The *Academia Naturæ Curiosorum* was established at Vienna, in 1652, by the physician Bauschius, for the investigation of remarkable phenomena in the animal, vegetable, and mineral kingdoms. In honor of Leopold I., who patronized it liberally, it took the additional name of *Cæsareo-Leopoldina*; and, since 1808, has had its chief seat at Bonn. Its valuable memoirs have appeared at irregular intervals under the title of *Miscellanea*, *Ephemerides*, and *Acta*. The *Académie de Médecine* of Paris was founded in 1820, for the prosecution of researches into all matters connected with the public health, such as epidemics, etc. The *Surgical A. of Paris* (whose functions have partly descended to the preceding) was founded in 1731. It was dissolved during the troubles of the first revolution. The *Vienna A. of Surgery*, established in 1783, is, properly speaking, a college.—5. FINE ARTS. The academies of painting and sculpture of St. Petersburg (connected with the Imperial A.) and Paris are institutions for the education of pupils. The French *Académie des Beaux Arts* is a branch of the Institut (q.v.). The *Royal A. of Arts* in London was founded in 1768, for the promotion of the arts of design, painting, sculpture, etc. The number of academicians is 40. Connected with it is a school, with professors selected from among the academicians. The annual exhibition of the academy is open to all artists of merit. The *Royal Scottish A.* of painting, sculpture, and architecture, was founded at Edinburgh in 1826, and received a royal charter in 1838. The number of academicians is 30; the general plan of the institution is similar to that of the London A. Similar to these also is the *Royal Hibernian A.*, incorporated at Dublin in 1803. Numerous academies of the fine arts have been established in Italy—at Rome, Milan, Turin, Florence, Mantua, and Modena; as also at Madrid, Vienna, and Stockholm.

Many learned societies differ from academies only in name; such as the Royal Society of London, the British Association, the Washington Smithsonian Institution, etc., etc. See SOCIETIES.

#### ACADIE. See NOVA SCOTIA.

ACAJUTLA, a sea-port in San Salvador, on the Pacific, 12 m. s. of Sonsonati, once the only harbor between Acapulco and Realejo; now second in importance in its country, but still having a third of the foreign trade. Peruvian balsam, 20,000 lbs. annually, is the chief export.

ACALEPHÆ (Gr. "nettles"), a term given by Aristotle to the jelly-fishes or medusidæ and their allies, in allusion to their stinging propensities. As in all other *cœlenterate* animals, the urticating or stinging properties of such forms reside in the *cnidæ* or "thread-cells," with which the tissues of their bodies are provided. These cells consist each of a sac or vesicle, containing fluid and a thread-like filament; the cell rupturing on being pressed or otherwise irritated, and emitting the thread and fluid. The former must act mechanically as a kind of dart; whilst the fluid acts chemically in producing irritating effects by its injection into the wound made by the filament. Some of the forms allied to the jelly-fishes, and included under the old term *acalephæ*—such as the *physaliæ* or "Portuguese men-of-war"—sting, by means of these cells, so severely that the effects on the human subject may persist for days or even weeks.

In modern zoology, it may be noted, the term *acalephæ* is now generally abolished. Formerly, this name was given to a group of *cœlenterate* or radiate animals, represented by the true medusidæ or jelly-fishes, and also by the *lucernaridæ*; whilst older systems still, included in the group *acalephæ* other oceanic organisms (*calycophoridæ* and *physophoridæ*) among which were the "Portuguese man-of-war," etc., and also the order *ctenophora* (*beroa*, *cestum veneris*, etc.), this latter order being now removed to a class superior to that of the jelly-fishes and their allies. In modern systems of zoological classification, therefore, the old division of the *acalephæ* is represented by at least two distinct orders of *cœlenterate* animals. Thus the true jelly-fishes or medusidæ constitute the sub-class *discophora* ("disk-bearers"), and are distinguished by being free-swimming forms; the body in each consisting of a single organism, and being composed of a clear gelatinous swimming-bell or *nectocaula*, from the roof of which the mouth is suspended; whilst throughout the substance of the bell-shaped body a system of *radial* and *circular* canals is distributed. These organisms, familiar to every sea-side visitor, swim gracefully by contracting and expanding their clear jelly-like bodies; the aperture or mouth of the bell being generally closed or protected by a membrane named the *veil* or *velum*. Around the margin of the bell *auditory sacs* or hearing-organs are found; and pigment-spots or *ocelli* existing in the same situation are believed to represent rudimentary eyes. Tentacles or organs of touch are also developed, and may depend from the margins of the bell. The true medusidæ are named *gymnophthalmata*, or "naked-eyed"

forms, to distinguish them from the *lucernarida*, in which the eyes are protected by a kind of "hood." The *lucernarida* accordingly

*a a*, tentacula; *b* mouth;  
*c*, termination of intestine.

Physalia.

are named by some zoologists *steganopthalmate* ("covered-eyed") medusæ; whilst, more properly, the latter term is limited to medusa-like forms included within that order. Amongst some of these "hidden-eyed" medusæ some very peculiar reproductive phases occur. Thus the egg of a medusa may be seen to give rise to a little rooted organism, like a little *hydra* (q.v.) in form, and which is named the *hydra-tuba*. This latter organism then becomes divided transversely into a number of saucer-like segments, and is named the *strobila* (sars); whilst, ultimately, the segments become detached, each swimming away as a young medusa, and being known as an *ephyra*. These animals feed on

minute crustacea, fishes, and the like; and very many exhibit a phosphorescent light, or animal luminosity.

**ACANTHACEÆ**, an order of monopetalous-exogenous plants, with didynamous flowers, known by an imbricated calyx in two broken whorls. The seeds grow from hooks on the placenta. Some of the *A.* have very beautiful flowers.

**ACANTHASPIS**, a genus of buckler-headed fishes in Ohio limestone, resembling *cephalaspis*; the buckler bears similar denticulated spines; the cranial plates are covered with vermicular ornamentation, and not firmly fastened together.

**ACANTHOPHIS**, a genus of serpents native to Australia, resembling the adder, but having a horny spine at the end of the tail. The genus includes the death-adder, one of the most venomous of reptiles.

**ACANTHOPTERYG II**, in zoology, one of the two primary divisions of the *osseous fishes* in the system of Cuvier, distinguished by having spinous rays in the first portion of the dorsal fin, or in the first dorsal if there are two. The name is derived from the Greek *akantha*, a thorn, and *pteryx*, a wing. The *A.* are divided by Cuvier into fifteen families, amongst which are *percidæ* (perch, bass, etc.), *trigluidæ* (gurnard, flying-fish, etc.), and *scomberidæ* (mackerel, tunny, etc.).

**ACANTHURUS CHIRURGEON**, or SEA-SURGEON, named from a sharp-pointed, keen-edged and movable spine in the side of the tail, which cuts like a lancet. The scales are small; its food is vegetable; it is found on Atlantic coasts of tropical America.

**ACANTHUS**, the name given by the Greeks and Romans to the plants sometimes called brancursine, of which it is also the botanical generic name. *A. mollis* and *A. spinosa*, natives of the south of Europe, are the species best known. The twining habit of the plants, their large white flowers, and, above all, the beautiful form of their dark and shining leaves, have led to their artistical application, especially in the capitals of Corinthian columns. See **ORDERS OF ARCHITECTURE**. Roman drinking-cups have been found whose handles are twined with *A.* leaves.—The ancients made the *A. mollis* chiefly their pattern; but in Gothic ornaments more use is made of the smaller and less beautiful leaves of *A. spinosa*.

The genus *A.* is the type of the natural order **ACANTHACEÆ**, which contains nearly 1400 known species. They are herbaceous plants or shrubs, chiefly tropical; dicotyledonous. The greater part are mere weeds, but the genera *justicia*, *aphelandra*, and *ruellia* contain some of our finest hot-house flowers. The leaves are opposite, rarely in fours, simple; two or three bracts, which are often large and leafy, accompany each flower. The calyx is persistent, usually 5-leaved, occasionally cut into many pieces, sometimes obsolete. The corolla is monopetalous, hypogynous, usually irregular, deciduous. The stamens are generally two; sometimes four, didynamous, the shorter ones sometimes sterile; the anthers 2-celled, opening lengthwise. The disk is glandular; the ovary free, 2-celled, with two or more ovules in each cell; placenta adhering in the axis; style one. The fruit is a capsule, bursting elastically with two valves, the dissepiment also separating into two pieces through the axis. The seeds are roundish, hanging by hard, usually hooked processes of the placenta; testa loose; albumen wanting; embryo curved or straight; cotyledons large; radicle subcylindrical, next the hilum.—Some of the *acanthaceæ* are used in their native countries as medicines. A valuable deep-blue dye, called room, is obtained in Assam from a species of *ruellia*.

**ACAPULCO**, the best harbor belonging to Mexico in the Pacific, and a place of considerable commercial importance; situated in lat. 16° 50' n., long. 99° 48' w. The harbor is so well sheltered that deeply laden vessels may lie safely at anchor close to the granite rocks. The t., defended by Fort Diego, on an eminence, has a very unhealthy site, and is one of the places most frequently visited by cholera, which proves especially fatal to new settlers. The population is composed of pearl-fishers, sailors, and husbandmen. The

chief exports are cochineal, indigo, cocoa, wool and skins; the imports are cottons, silks, spices, and hardware. Pop. about 5000.

**ACARNA NIA**, a country of ancient Greece, separated from Epirus on the n. by the Ambracian gulf, now the gulf of Arta; from Ætolia on the e. by the river Achelôus; and washed s. and w. by the Ionian sea. Along with Ætolia, it forms one of the *nomes* or departments of the modern kingdom of Greece. The w. part of A.—from the mouth of the Achelôus or Aspropotamo to cape Actium in the n.w.—is occupied by a mass of rocky and thickly-wooded mountains, rising abruptly from the indented coast, and culminating in the summit of Berganti. A considerable part of A. is overgrown with wood—a rare feature in modern Greece. There is no t. of importance in the whole district, though naturally it is not destitute of resources.

**ACARUS**, a genus of *arachnides* (q.v.), of the order *trachearia*, the type of a tribe called *acarides*, which corresponds with the genus *acarus* as defined by Linnæus. The species of the acarides are very numerous. All of them are small; many microscopical. Some are familiar to us under the names of mites (q.v.), ticks (q.v.), etc. Some live upon the juices of plants; some in the dung of animals; many species are found in the vegetable and animal substances used for human food, especially when these have been kept for a considerable time, as in cheese, flour, sugar, on the surface of preserves, of dried fruits, etc.; others are parasites upon the bodies of animals, particularly in diseased conditions, as in cases of itch. A minute species has been detected in the follicles of the human skin, and others even in the human brain and eyes. Some insects, particularly beetles, are often covered with acarides. A species (*trombidium holosericeum*) common in gardens in spring is remarkable for its blood-red color; and a nearly allied but much larger species (*T. tinctorum*), found in the East Indies, yields a fine dye. A Persian species (*argas persicus*) is poisonous and causes sores. The bite of many species is annoying, as of the common harvest bug (*leptus autumnalis*). The acarides have eyes. Some of them have the mouth furnished with mandibles, others with a sucker. They are oviparous, and extremely prolific. They have generally eight legs; but, when young, many of them have only six, and in some genera the additional pair seems never to be acquired. A few are aquatic, and have legs covered with hairs to adapt them for swimming.

**ACARUS FOLLICULORUM** is the most generally accepted name for a microscopic parasite residing in the sebaceous sacs and hair follicles of the human skin. It is also known as the *demodex folliculorum*, the generic name being derived from the Greek words *demo*, lard, and *dex*, a boring worm. It was first described by Dr. Simon of Berlin in 1842, under the title of *acarus folliculorum*, which was suggested by the eminent zoologist, Erichsen of Berlin. In the following year, Mr. Erasmus Wilson made it the subject of an elaborate memoir, which appeared in the *Philosophical Transactions*, in which, as there are doubts as to its exact zoological position, he simply terms it the *entozoon folliculorum*. According to professor Owen, who gave it the name of *demodex*, it represents the lowest form of the class *arachnida*, and makes a transition from the *annelids* to the higher *articulata*. As regards the size and form of these animals, there is much variety; they pass their whole existence in the fatty matter of the sebaceous cells, moulting repeatedly during their growth, and being finally expelled from the follicles with the secretions of these organs. Their presence has no reference, according to Mr. Wilson, to disease of the skin or of the follicles. They are met with in almost every person, but are most numerous in those in whom the skin is torpid, in invalids, and in the sick. They vary in length from  $\frac{1}{16}$ th to  $\frac{1}{8}$ th of an inch, and the accompanying figure represents the magnified parasite. Their number is various; in some persons not more than two or three can be found in a follicle, while in others Mr. Wilson has seen upwards of fifteen. The head is always directed inwards, and when a number are present they seem to be collected into a conical bundle, the larger end of the cone being formed by their heads. The situation in which they are most commonly found is the skin of the face, and particularly that of the nose, but they have also been met with in the follicles of the back, the breast, and the abdomen. As far as we know, they are never found on the limbs.

A reference to the figure shows that the animal possesses eight thoracic appendages (*c, c*) of the simplest and most rudimentary kind, each of which is terminated by three short setæ. The integument of the abdomen is very finely annulated. The mouth is suctorial or probosciform, consisting of two small spine-shaped maxillæ (*b*), and an extensive labium capable of being elongated or retracted; it is provided on each side with a short, thick, maxillary palp (*a, a*), consisting of two joints with a narrow, triangular labrum above. The sexes are distinct, but the differences between the male and female are not well recognized. Ova are frequently seen, both in the body of the female and in detached discharged masses. Any of our readers may readily observe their own *acari* by collecting between two pieces of thin glass the expressed fatty matter from a nasal follicle, and moistening it with a drop of olive oil. Very similar if not identical animals have been found in the contents of the pustules of mangy dogs.

*Acarus folliculorum*, magnified.

**ACASTUS**, a son of Pelias, king of Iolcus; one of the Argonauts and of the Calydonian hunters. He revenged the murder of his father (killed by his daughters at the instigation of Medea) by driving Jason and Medea out of Iolcus.

**ACATHISTUS**, a hymn sung in the ancient Greek church in honor of the virgin.

**ACAYUCAN**, a t. of Mexico, a military port, about 100 m. s.s.e. of Vera Cruz, having trade in cochineal. Pop 6000.

**ACCAD**, a city of Babylonia. It has been identified with Nisibis. Rawlinson supposes Accad to be the name of the primitive Hamite race of that country.

**ACCELERANDO** (Ital.), in music, with gradually increasing velocity of movement.

**ACCELERATED MOTION**, in mechanics, is motion in which the velocity is continually increasing. When the increments of velocity are equal in equal times, the motion is said to be *uniformly* accelerated. The best example of such a motion is that of a falling body. It is found that near the earth's surface a body, descending from a state of rest, falls  $16\frac{1}{2}$  ft. in the first second. Now a little consideration will show that at the end of the first second it is moving at the rate of  $32\frac{1}{2}$  ft. per second. For since the velocity was nothing at first and increased uniformly,  $16\frac{1}{2}$  ft. must have been the *mean* velocity—i.e., the velocity at the middle of the time; and therefore the velocity at the end must be double, or  $32\frac{1}{2}$  ft. :  $32\frac{1}{2}$  ft. is thus the measure of the accelerative force of gravity. At the end of the second and third seconds the velocity is found to be doubled, trebled, etc., or  $64\frac{1}{2}$ ,  $96\frac{1}{2}$  ft.

**ACCELERATION OF THE MOON**. It was first observed by Halley that the time of the moon's revolution round the earth has for several thousand years been decreasing, or her velocity has been increasing. This phenomenon remained for a considerable time inexplicable; at last, Laplace, in 1787, discovered the cause in the varying eccentricity of the earth's orbit, which has been on the decrease since about 12,000 years B.C. Since that time the moon has been gradually coming nearer to the earth; and this will go on till 36,900 after Christ, when the eccentricity of the earth's orbit will begin again to increase.—**ACCELERATION OF THE FIXED STARS** is the excess of a mean solar day over a sidereal day; i.e., a day measured by the transits of a star over the meridian; the excess is about 3  $56\frac{1}{2}$ " sidereal time.

**ACCENT**, in grammar, is a special stress of voice laid upon one syllable of a word, by which it is made more prominent than the rest; the accented syllable is sometimes indicated by a mark, as *awa'y*, *fortify*. Every word in English has one syllable thus brought markedly into notice. When the accented syllable falls near the end of a long word, there may be one or more secondary accents, as in *re'comme'nd*, *subo'r'dina'tion*. A. depends upon force of vocal or articulative effort, not upon highness or lowness of pitch. Variations of pitch produce what elocutionists call *inflection*. It is the confounding of A. with a rise of tone, and the contrasting of it with a sinking of tone, that has produced so much confusion on this subject, especially as regards the accents of the ancients. In English, many nouns are converted into verbs simply by transposing the A., as *o'bject—ob'ject*. It is A., and not quantity, that determines English measures or metres in versification. No rule can be given as to what syllable of a word shall be accented. There seems to be an increasing tendency in our language to throw the A. towards the beginning of words. In the Finnish language, the A. is said to be invariably on the first syllable.—*Emphasis* is to sentences what A. is to words; it is a stress laid upon one word of a sentence to make it prominent. If A. is syllabic emphasis, emphasis is logical A.

**ACCENT**, in music, is analogous with A in language. It consists of a stress or emphasis given to certain notes or parts of bars in a composition, and may be divided into two kinds—grammatical, and rhetorical or æsthetic. The first kind of A. is perfectly regular in its occurrence—always falling on the first part of a bar. It is true that long or compound measures of time have, besides the chief A. in every bar, some subordinate accents; but these are only slightly marked. As a general rule, we may observe that the grammatical or regular A. must not be exaggerated. It should be marked only so far as to give a clear sense of rhythm. The æsthetic A. is irregular, and depends on taste and feeling, exactly as does the A. and emphasis used in oratory. In vocal music well adapted to words, the words serve as a guide to the right use of æsthetic accents.

**ACCENTOR**, or **ACCENTOR MODULARIS**, a genus of warbling birds, including the hedge-sparrow; about  $5\frac{1}{2}$  in. long, brown above and steel color beneath. The Alpine sparrow is larger.

**ACCEP TANCE** is the act whereby the drawee engages to pay a bill according to the terms of the A. It may be said to consist in the drawee writing the word "accepted" on the bill and subscribing his name; or writing, as has been decided in England, the word "accepted" only (although it is not so in Scotland, where the act of A. must be shown by the actual signature of the acceptor); or merely subscribing his name at the bottom or across the bill. But there are other and various forms of A. in England and Scotland, as to which, and generally, see **BILL OF EXCHANGE**. In common parlance,

the accepted bill is called an *A.*, and the drawee, or party who engages to pay the bill, is called the *acceptor*.

*A.* is also a term in the Scotch law of contracts. A mutual contract may commence by an offer, and be completed by *A.* The offer is viewed as an obligation provisional on the *A.*, but may, before *A.*, be recalled, on condition of making reparation for any loss fairly occasioned by the offer. The offer may be verbal, by letter, or even tacit, as when goods are sent without an order, or contrary to order, in which case acquiescence is *A.* The *A.* may be either tacit or express. The word is not a technical one in the law of England, but the matter to which it relates in that system will be found under CONTRACT.

ACCEPTANCE (*ante*), an agreement to pay a bill when legally due, applied usually to bills of exchange. There is no fixed time within which a bill must be presented for *A.*, but usage prescribes as early a time as may be reasonably convenient, so that the acceptor may know when it becomes due. When a bill is drawn upon one's self, or by a partner in a firm upon that firm, or by an officer of a corporation upon such corporation, no *A.* is needed. When a bill is upon a firm, presentation for *A.* may be made to any of the partners; if to be accepted at a bank, it must be presented within the usual bank hours; or to a man of business at his place of business within the customary business hours. An *A.* may be either conditional, qualified, or complete; it may be in writing or oral, where no law to the contrary exists; it may be before or after the drawing, or after it is due; it may be by the maker of the bill, or by anybody who chooses to protect the paper. The common usage is to accept by writing on the bill itself the word "accepted," or more generally the mere signature of the acceptor suffices. The law of N. Y. requires *A.* in this form, and if the party refuses to sign his name the bill is subject to protest. Destroying a bill or refusing to return it within one day, whether accepted or not, is held to be equivalent to accepting. Where *A.* is given with conditions, the drawer of the bill should be apprised of and satisfied with such conditions. To prevent loose *A.* the statute of N. Y. requires that no one shall be charged as accepting unless his *A.* is in writing and signed by himself or his proper agent. It is also declared that a promise in writing to accept, although made before the bill is drawn, is in fact an *A.* in favor of any one who took such bill for value, on the faith of such promise in writing. It has been held that authority in writing or by telegraph to draw on a person is equivalent to that person's *A.* of the bills drawn; also that a letter of credit conferring authority on the holder to draw upon the author of the letter is equivalent to a promise in writing to accept the bills drawn. An *A.* is an admission of the signature of the drawer; so if the signature be forged, the acceptor is liable to the holder, presuming the latter to be innocent. Where *A.* is refused, the holder must satisfy the drawers and endorsers if he wishes to hold them, though failure to notify may not imperil the holder's action against them if it shall appear that no injury has been sustained by them in consequence of such failure; still the presumption is in their favor, and the burden of proof is on the holder. Foreign bills are protected in official form. This is not necessary in the case of home bills, unless where required by special statutes.

ACCESSARY or ACCESSORY. In the criminal law of England, an *A.* is a person who is not the chief actor in a felony, nor even present at its perpetration, but who is in some way concerned, either *before* or *after* the fact committed. An *A. before* the fact is one who procures or counsels another to commit a crime, he himself being absent. An *A. after* the fact is a person who, knowing a felony to have been committed, receives, protects, or assists the felon. In sudden and unpremeditated offences, there can be no accessaries *before* the fact; and in all crimes under the degree of *felony* there are no accessaries at all, either before or after the fact, but all persons concerned therein are held to be equally guilty as principals.

There are no accessaries in treason, but all are principals, on account of the heinousness of the crime.

In the Scotch law, "art and part" in the indictment, or formal accusation, is the phrase by which accession to a crime is signified; and it applies to all offences against the criminal law, there being, according to the practice of the Scotch courts, no distinction in this respect between felonies, properly so called, and misdemeanors.

ACCESSION. In the law both of England and Scotland, property may be acquired by *A.*, and this *A.* may be either natural or artificial. The young of cattle and other animals, for example, belong to the person who is the owner of the mother, and the fruits and produce of the earth to the proprietor of the soil; and for the same reason, the gradual addition to lands on the bank of a river belongs to the proprietor of the land receiving the addition. These are instances of *natural A.* Property, again, is said to be acquired by *artificial A.* when it is the result of human industry; thus trees planted, or buildings erected, on the ground of another, belong to the owner of the ground itself, and not to the planter or builder; and so with regard to the conversion of wood or metal, which, in whatever form, remain the property of the original owner.

ACCESSION, DEED OF. In the practice of Scotch conveyancing, this is a deed by which the creditors of a bankrupt or insolvent debtor approve of a trust-settlement executed by the debtor for the general behoof, and consent to the arrangement proposed. The cor-

responding deed in English practice is a deed of trust for creditors, or, under the bankrupt law consolidation act, 12 and 13 Vict. c. 106, a deed of arrangement for creditors.

**ACCESSION TO THE THRONE** signifies the commencement of the sovereign's reign.

**ACCESSORY** (*ante*). An A. before the fact is one who participates in the act; an A. after the fact, one guilty of a crime of his own in which the principal properly had no share. Perpetrators in person of crime may be principals in first or second degree; one not present who counsels or procures a crime to be committed is accessory before the fact. If the instigator gave such advice in the presence of the actual offender, he would be himself a principal. In case of murder all present who aid or abet the killing are principals; but if two men fight to kill one another, and the bystanders, ignorant of such intent, join in and one is killed, they are not guilty of murder. But if one conspires with another to do a murder, and himself keeps watch against surprise or escape, the act of watching makes him a principal, for he is constructively present, though he may not see the deed done. If A tells B to whip C, and B does so, B is principal and A accessory before the fact. If A tells B to commit a crime, and B commits a different crime, A is not accessory in any way; but if B in trying to do A's request kills the wrong person, A would be accessory before the fact. Recent statutes provide that a person procuring a crime to be done shall be punished the same as the principal. In N. Y. the accessory before the fact may be tried and punished, though the principal may have been pardoned or discharged before conviction; and so in Massachusetts, if the principal be not amenable. There, too, the aider and abettor, who in common law would have been a mere accessory, may be indicted and convicted of a felony without regard to indictment or conviction of the principal. Most of the states have similar statutes.—An accessory after the fact is one who, knowing the guilt of a felon, whether principal or accessory before the fact, receives, protects, or assists him; but it should probably be added, "with intent to hinder his trial, conviction, or punishment." Merely allowing a felon to escape, or ministering to his physical necessities, will not make one an accessory. Once the common law did not except any who aided in an escape unless a wife who aided her husband; but modern statutes are less rigid, or more liberally construed. In Massachusetts the statute excepts from criminal blame as accessory such relations as parent or grandparent, child or grandchild, and brother or sister to the offender, and similar laws prevail in most of the states, at least in practice.

**ACCESSORY ACTIONS**, in the practice of the Scotch law, are those which are, in some degree, subservient or ancillary to other actions. For example, actions for reviving a cause, or prosecuting it against the heir of a deceased defendant, or for restoring lost deeds or other documents, are of the nature of A. A.

**ACCESSORY OBLIGATION** is a technical term in the Scotch law signifying an obligation annexed to another obligation which is antecedent or primary. Thus, an obligation for the regular payment of interest, or by way of further security, is an A. O.

**ACCIAJUOLI, DONATO**, 1428-78; famous for learning in Greek and mathematics, and for services to Florence, his native state. After filling several important embassies, he became gonfalonier of Florence in 1473. Five years afterwards he died at Milan while on his way to Paris to ask the aid of Louis XI. on behalf of the Florentines against Pope Sixtus IV. He died poor, and his daughters were adopted by his fellow citizens. A. wrote commentaries on Aristotle's *Ethics* and *Politics*, and translated some of Plutarch's *Lives*. He also wrote the lives of Hannibal, Scipio, and Charlemagne.

**ACCIDENT**, in law, an unforeseen event, loss, act, or omission, not the result of negligence or misbehavior in any of the parties; such as the loss of negotiable or other papers; or where some part of a document has been omitted, in which case the court can require its insertion. In penalties and forfeitures, where the injury caused by omission of duty can be reasonably compensated, as in case of failure to pay rent on a given day, the court may relieve the offending party against the penalty of forfeiture. Where there has been neglect or omission through want of information or through negligence to defend a suit, the court may permit the proper steps to be taken. But as a rule a court will not interfere in favor of a mere volunteer; so if a seal should be omitted from a conveyance made without consideration, or a clause should be left out of a will, no relief would be extended. It is also ruled that no relief will be granted against a purchaser who has acquired legal rights in good faith for a consideration of value.

**ACCIDENTAL COLORS.** See **LIGHT**.

**ACCIDENTS**, in music, occasional sharps, flats and naturals placed before notes in the course of a piece.

**ACCIDENTS**, in logic, are opposed to essentials, or to substance. An accident is a property of an object which may be modified, or even be altogether abstracted, without the object ceasing to be essentially what it is. But many of the distinctions made by the older philosophers between accidental and essential are fallacious.

**ACCIPITRES** (plural of the Lat. *accipiter*, a hawk), the name given by Linnæus to an order of birds, including, according to his system, the genera *vultur* (vultures), *falco* (eagles, falcons, hawks, etc.), *strix* (owls), and *lanius* (shrikes), and principally distinguished by a hooked bill, short strong feet, and sharp hooked claws. The name has not generally

been adopted by subsequent ornithologists, but the order, as a truly natural one, has been retained under the names *raptaces*, *raptores*, etc.; the shrikes, however, being generally excluded from it.

**ACCLAMATION**, an expression of opinion of any assembly by means of the voice. Among the Romans A. was varied both in form and purpose. At marriages the spectators would shout "Io Hymen," "Hymenæ," or "Talassio." A victorious army or leader was greeted with "Io triumphe." In the theater approbation for the play was asked by the actor speaking the closing words, who added "Plaudite." In the senate opinions were expressed and votes passed in such forms as "Omnes, omnes," "Æquum est," "Justum est," etc.; and the praises of the emperor were celebrated in certain prearranged sentences which seem to have been chanted by the whole body of senators. At first the A. which greeted the works of poets and authors recited in public was genuine; but the modern *claque* was early introduced by rich pretenders to literary ability who kept paid applauders not only for themselves but lent them to their friends. Nero gave a specimen when he caused 5000 soldiers at a given signal to chant his praises in the theater; the soldiers were called "augustals," and were conducted by a regular music-master. In the early times of the Christian church it was not uncommon for a congregation to express their approbation of a favorite preacher during the course of his sermon; and in this manner Chrysostom was frequently interrupted. In ecclesiastical councils voting by A. is very common, the question being usually put in the form "placet" or "non-placet." In other assemblies A. is expressed by "ay" or "agreed."

**ACCLIMATIZE**, to accustom an animal or plant to a climate not natural to it. The process, of course, varies widely, according to the amount of difference between the old and the new climate. In cases where the difference is extreme, important changes take place in the constitution, and are often attended with certain diseases described as "diseases of acclimatization." Thus, Europeans settling in tropical parts are liable to disease of the liver, while natives of tropical lands, when resident in England, are exposed to pulmonary disease. The power of bearing changes of climate is greatest in the Anglo-German race, and usually bears a direct ratio to the intellectuality of a race. Civilized people display greater ingenuity and strength of will than savages in accommodating themselves to changes of climate, by making careful corresponding changes in their mode of life. Ulloa and Humboldt assert that persons of and above middle age best stand transportation to tropical climates. Among animals, we find great powers of adaptation to various climates in the horse, dog, cat, rat, etc.; and among plants, in the various cereals, in potatoes, and several weeds common to almost all climates; but there seems to be a limit to the power, at least as seen in the individual. To A. beyond a certain point is the work of some few generations. Almost all the domestic animals now commonly spread over Europe, and even in high northern latitudes, were originally natives of warm climates. The change produced by the acclimatizing of animals may be either an improvement or a deterioration; of the latter, we have an instance in the Shetland pony; of the former, we see an example in the merino sheep of Spain. As an instance of want of the faculty of being acclimatized, the reindeer may serve. Removed from the cold north to the fertile valleys of a temperate clime, the reindeer degenerates and dies. On the other hand, the horse, whose native land is the east, arrives at its highest development in England; and the Syrian sheep, brought northwards as far as Spain, becomes remarkable for its fine fleece. Spain, on the whole, has a climate much warmer than that of Silesia and Pomerania; and yet the merino sheep, bred in these countries, have become superior to their ancestors imported from Spain. This is a proof that art may do very much in modifying the influences of climate. Silk-worms, brought from China first into Italy, have been acclimatized not only in the s. of France, but even on the coast of the Baltic. Recently, attempts have been made to A. in France the llama, the vicugna, and the alpaca of Peru, and with some success in the last instance, as alpacas have been found to thrive pretty well in the Pyrenees. It has been very generally believed that plants may become gradually inured to a climate so different from that to which they have been accustomed, that if they had been at once transferred to it, they would have perished. On the other hand, it is maintained that each species of plant has certain limits of temperature within which it will succeed, and that alleged instances of acclimatizing have been merely instances of plants formerly supposed to be more delicate than they really were. But as it is certain that different varieties of the same species are often more or less hardy, it would seem that in the production of new varieties by seed, there is still a prospect of the acclimatizing, to a certain extent, of species of which the existing varieties are too delicate to grow well in the open air. Of late years numerous acclimatization societies have been formed, the best known being the Paris *Société d'Acclimatation*.

**ACCOLADE**, the term applied to the ceremony with which a knight was admitted into the order of chivalry. The grand-master, in receiving the neophyte, embraced him by folding the arms round the neck (*ad collum*).—In music, the A. is the couplet uniting several staves, as in part-music or pianoforte-music.

**ACCOLTI**, BENEDETTO, 1415-66; was secretary of the Florentine republic, and remarkable for powerful memory. From a book by him on the first crusade, Tasso got material for *Jerusalem Delivered*.

AC'COMACK, a co. in e. Virginia, on the Maryland border; 480 sq.m.; pop. '70, 20,409—7842 colored. The surface is level, and the soil moderately fertile, producing corn, oats, sweet potatoes, etc. Co. seat, Drummondtown, or Accomack court-house.

ACCOM'PANIMENT, in music, is the assisting or aiding of a solo part by other parts, which may consist of a whole orchestra, or a single instrument, or even subservient vocal parts. It serves to elevate and beautify the solo part, and is subject to certain rules for composition as well as for performance. It must be subservient, and therefore should not predominate, but merely assist to place the solo part in its brightest light. In this point of view, modern composers have often erred by making the A. too full, and causing it to stand out so independent and engrossing, that the solo part is often, as it were, entirely lost. This abuse takes place mostly in vocal music; and not only is the effect destroyed, but the vocal organ of the singer is frequently ruined. Were it not too true that this bad practice has become the fashion, it would be difficult to believe that a composer would lend himself to it. In proper A., after faithfully fulfilling its duty to the solo part, there always remains opportunity enough for display in the ritornells and symphonies. The Italians in their best period were celebrated for the simplicity and effectiveness of their A. Now they have entirely lost this claim. In A., the composer must keep three principal points in view—namely, harmony, rhythmical figure, and suitable choice of instrumentation, in respect to number and character of tone; but all must be subservient to the ruling character of the solo part. Right or proper harmony is, or should be, easily found by every experienced composer. It is, as it were, born at the same time with the melody, and only requires to be here and there adjusted with care. When this is not the case, there arises a double character, which interrupts and totally destroys the melody. The figure of the A. should be chosen so as to be conformable to the solo part, having to express what the solo part cannot be expected to do, and may also, by a succession of secondary ideas, render clear and certain the individuality of the principal solo part, such as the blustering of the poltroon, the daring of the courageous, or the fear of the timid. The necessity of a judicious choice of instrumentation for the proper support of the solo part is evident. The A. should, above all things, by its certainty and firmness, prevent wavering. Good A. is as creditable as solo playing; and all qualified orchestras view it as of great importance.—The word also means the art of playing harmony from a figured bass; this, though more in use formerly, is still a necessary study for the A. of recitative. See FIGURED BASS.

ACCORAMBO'NI, VITTORIA, an Italian woman remarkable for her beauty and her tragical history. She was sought in marriage by Paolo Giordana Orsini, duke of Bracciano, who was supposed to have murdered his wife Sabella de Medici; but A.'s father gave her to Francisco Peretti, nephew of cardinal Montalto. The husband was assassinated in 1581, and the widow fled from her father-in-law's house to that of the duke of Bracciano. Pope Gregory XIII. opposed her marriage to the duke so far as to keep her a prisoner in the castle of St. Angelo nearly a year, but that did not prevent their union. Not long afterward the duke died, leaving nearly the whole of his fortune to the widow. This so incensed Ludovico Orsini, a relative, that he caused the widow to be murdered in her home in Padua, Dec. 22, 1585.

ACCOR'DION, a simple musical instrument, but little better than a toy, which produces its tones by the vibration of metallic tongues of various sizes, while wind is supplied by the action of bellows. The *concertina* and the *harmonium* are superior instruments, constructed on the same principle—the action of a gust of air on metallic tongues.

ACCOR'SO, FRANCIS, 1182–1260; a lawyer of Florence, and professor and teacher at Bologna. He compiled in his work *The Great Gloss*, the substance of almost innumerable comments upon codes, digests, and institutes from previous writers. He disentangled with much skill the sense of many laws; but his ignorance of history and antiquities led him into many absurdities. His son Francis, also professor at Bologna, was invited to Oxford by Edward I. of England, and read lectures in the university in 1275–76.

ACCOUNT, a statement of receipts and disbursements; any statement of the condition of business, particularly with regard to financial affairs. In trade an A. current is one running or unsettled. Statements of A. are made at any time desirable, or at stated times, or on request, or demand. There is an action in law, seldom used, to compel the rendering of an A. by officers required to do so but neglecting the duty. In actions for A. both parties may be plaintiffs or defendants.

AC'CRA, or ACRA, part of West African gold coast, under the rule of England. Fort St. James, lat. 5° 32' n., long. 0° 12' w., governs a small territory with a population of about 3000 blacks. Crevecoeur, an old Dutch settlement, a mile east, was destroyed by the English in 1783, rebuilt in 1839, and ceded to England in 1872. The climate is salubrious.

AC'CRINGTON, a manufacturing town of England, in Lancashire, which has recently increased much in size and importance, lies in a deep valley, surrounded by hills, about 34 m. n.e. of Liverpool, and 13 m. e. of Preston, on the banks of the Hindburn. Pop., including Old A., '61, 17,688; '71, 21,788. Christ church is a fine gothic building, erected in 1838. The inhabitants are mostly employed in cotton factories, weaving, and calico-printing. A. is considered the center of the cotton-printing business. There are

coal-mines in the neighborhood, in which many of the inhabitants find employment.—  
OLD A. is an adjacent chapelry, also with cotton manufactures.

**ACCUBATION**, the posture of Greeks and Romans at table. Their low tables were surrounded by couches on each of which usually three persons reclined, lying on the left side, the elbow or head on a pillow, the feet behind the next person. The middle was held to be the place of honor. Roman women deemed the position immodest, but finally adopted it; children and persons of mean condition were not permitted the custom.

**ACCUM**, FREDERICK, a native of Westphalia, came to London in 1803. He is known in this country chiefly on account of his work, *A Practical Treatise on Gas-light*, which had the effect of introducing that method of illumination into London and all the large towns of England. It was translated into several languages, and became very popular. Subsequently, he wrote a book upon practical chemistry, which was well received, and one on the adulteration of food. Ultimately he became professor in an institution in Berlin, where he died in 1838.

**ACCUMULATION OF POWER**, the quantity of motion in machines at the end of given intervals, during which velocity has been constantly accelerated. A simple case is the rammer of a pile-driving machine, which descends by force of gravity in a certain time and falls upon some object. If the object does not move, the velocities of all the particles in the hammer, which had gone on increasing during the descent, are destroyed, and thus a shock is produced immensely greater than that which would result from the mere pressure of the hammer. The effect is directly proportional to the mass in motion, and to the square of the velocity at the instant of impact.

**ACCUSATIVE CASE.** See DECLENSION.

**ACEL/DAMA**, a potter's field or working-place; said to have been bought by the Jewish priests with the money received by Judas for betraying Christ; afterwards set apart as a burial-place for strangers dying in Jerusalem. It is there shown, on the slope of the hills beyond the valley of Hinnom, s. of mount Zion.

**ACEPH'ALA.** See MOLLUSCA.

**ACEPH'ALOCYST**, a cyst without a head, a hydatid growth, found in the liver, kidney or other abdominal organ of man, and sometimes of lower animals. It is a globular sac with walls of condensed albuminous substance and laminated texture; in its cavity is a colorless fluid with albuminous and gelatinous ingredients. Sometimes many secondary cysts grow from a main one. They are of parasitic nature, of the class of cestoids, of which the tape-worm is a familiar representative.

**A'CER and ACERA'CEÆ.** See MAPLE.

**ACER'RA** (anc. *Aceræ*), a town in south Italy, in the province of Caserta, nine m. n.e. of Naples, with which it is connected by railway. It was once fortified, but the walls are now crumbling into ruins. It has a cathedral and seminary. The country around is fertile, but extremely unhealthy, being afflicted with malaria, caused partly by the sluggish artificial channels called the Regj Lagni, the representatives of the *Clanlus non æquis Aceris* of Virgil; and partly by the flax-grounds, where the stocks are left to macerate. Pop. nearly 12,000.

**AC'ETAL** ( $C_{12}H_{14}O_4$ ) is a colorless liquid, of an agreeable odor, and a flavor said to resemble that of the hazel-nut. It is one of the products of the slow oxidation of alcohol under the influence of finely-divided platinum, or of chlorine, or of dilute sulphuric acid and peroxide of manganese. Its specific gravity is 0.821, and it boils at  $221^{\circ}$ . It yields various reactions and products of interest in organic chemistry.

**AC'ETATES**, compounds in which acetic acids are principal ingredients; generally soluble in alcohol and water, and some are deliquescent; the least soluble are acetates of mercury, silver, molybdenum, and tungsten. There are other classes of salts, neutral, active, and basic, all destroyed at red heat or by sulphuric acid, the latter liberating acetic acid, easily recognized by its pungent odor. Heated with sulphuric acid and alcohol they produce acetic ether; with lime, acetone, which has a peculiar odor; distilled with caustic potash, they yield marsh gas. Their solutions yield a deep yellow color with ferric chloride, not given by free acetic acid. Acetates are much used in medicines and the arts; potassic acetate is prescribed for a diuretic; ammoniac acetate as a diaphoretic; plumbic acetate (sugar of lead) is an astringent. Acetates of aluminium, manganese, iron and zinc are used in calico-printing; acetate of copper (verdigris) mixed with arsenite of copper is used in wall-paper.

**ACETIC ACID**, the sour principle in vinegar, is the most common of the vegetable acids. If alcohol, diluted with water, be mixed with a ferment, such as yeast, and exposed to the air at, or a little above, its ordinary temperature, it is rapidly converted into vinegar or A. A. The change is accompanied by the absorption of oxygen, two atoms of which combine with as many of hydrogen to form water, whilst other two take the place of the hydrogen which has become water, so that A. A. is produced from alcohol by the substitution of two atoms of oxygen for two of hydrogen. Thus alcohol is  $C_2H_5O$ . If we take from this two atoms of hydrogen, and add two of oxygen, it becomes  $C_2H_3O_2$ . But from the mode in which A. A. acts when it combines with bases, it is cer-

tain that one of the equivalents of hydrogen and one of oxygen are united as water, so that the formula of A. A. is  $C_4H_5O_3 + HO$ . A striking experiment may be made illustrating the mode in which alcohol is converted into A. A. If slightly diluted alcohol be dropped upon *platinum-black*, the oxygen condensed in that substance acts with great energy on the spirit, and A. A. is evolved in vapor. Here the whole office of platinum is to determine the oxygen of the air, and the hydrogen of the alcohol to unite. In the commercial processes for manufacturing vinegar, some vegetable substance containing nitrogen (one of the albuminous principles) takes the place of the platinum-black, and determines the same change. A. A. is not known in the anhydrous form. In its most concentrated state it contains an equivalent of water,  $C_4H_5O_3 + HO$ . When it combines with metallic oxides, they take the place of the water; acetate of soda, for example, consisting of anhydrous soda and anhydrous A. A.,  $NaO, C_4H_5O_3$ . The salts of A. A., called ACETATES, are numerous and important in the arts. The most important is acetate of sugar of lead. See LEAD. For the commercial processes of manufacturing A. A., see VINEGAR.

**ACETIFICATION.** Since the article ACETIC ACID was originally written, a totally new view has been adopted regarding the process by which wine, beer, cider and alcoholic fluids generally become converted into acetic acid, when they are exposed to the action of the air, and especially in hot weather. The views held by Liebig regarding the part that wood-shavings, sand, ash, etc., play in condensing oxygen, and transmitting it to the alcohol, are now supplanted by those of Pasteur, who maintains that the true acetifying matter is a very minute mycoderma—a special vegetable organized being. It is impossible to conceive a more simple form of vegetation, consisting of extremely minute spores arranged in chains; each spore having a mean diameter not exceeding  $\frac{1}{170000}$ th of an inch, and the length being about twice as great. The rapidity of the development of these spores, under favorable circumstances, is almost inconceivable; and the power which they possess in fixing the oxygen of the air, and of transmitting it to the alcohol, and of establishing an incomplete combustion of the latter, is no less wonderful. A surface of a square yard covered with this plant is able, in the course of 24 hours, to fix the oxygen of more than 1000 quarts of air. The temperature of the surface of the fluid at which this slow combustion is proceeding is considerably raised, and often remains for several days at  $21^\circ$  or  $25^\circ$  above that of the surrounding air. The process which has just been described bears a very close analogy to the respiratory process, the oxygen of the air being in one case fixed by minute vegetable cells, and in the other by the blood corpuscles.

**ACETYL** ( $C_2H_3O_2$ ), known also under the names *acetoaryl* and *ethyl*, is an organic radical not yet isolated, but which is supposed to exist in acetic acid and its derivatives; the rational formula for acetic acid being on this hypothesis  $C_2H_3O_2 \left\{ O_2 \right.$ . See TYPES,

**CHEMICAL.** The reason for assuming the existence of this radical in the acetic compounds is that the formula to which it leads affords the simplest explanation of the most important reactions of acetic acid. Thus, when acetic acid is treated with a metallic hydrate, the basic atom of hydrogen is replaced by a metal, and an acetate of the metal  $C_2H_3O_2 \left\{ M \right.$  is produced. The term *acetyl* was formerly applied to the radical  $C_2H_3$ , and the anhydrous acid was regarded as a binoxide of this radical. Hence the two other names for the subject of this article—the former suggested by Kolbe, and the latter (an abbreviation of oxygen-ethyl) by Williamson.

**ACETYLENE**, a colorless gas of disagreeable odor, perceived where coal-gas is not perfectly burned. It burns with a bright, smoky flame, and has been made by running marsh-gas through red-hot tubes. In copper pipes for coal-gas, acetylene deposits a dark red copper compound, which explodes with violence at a blow or under heat. Mixed with chlorine, it explodes spontaneously.

**ACHÆANS**, one of the four races of ancient Greece, and a name often given by Homer to all Greeks. The A. inhabited parts of Thessaly, Argos, and Sparta, in the Peloponessus, whence they were expelled by the Dorians. Their government was democratic, and they preserved liberty until the time of Philip and Alexander, but were afterwards subject to the Macedonians, or oppressed by domestic tyrants. In mythology, their ancestor was Achæus, son of Xuthos and grandson of Hellen.

**ACHÆMENES**, ancestor and founder of the family of Achæmenidæ, from the time of Cyrus the royal house of Persia.

**ACHÆMENES**, son of Darius and brother of Xerxes, who made him satrap of Egypt, 484 B.C. He fell in 460, in an attempt to quell a revolt of Libyan chiefs.

**ACHAÏA**, a small district in the n. of the Peloponessus, was divided into twelve little states; and was bounded e. by the Saronic gulf; n. and w. by the bay of Corinth; and s. by Arcadia and Elis. The land, rising gradually from the coast to the hills of the interior, was famed, in ancient times, for fertility in the produce of oil, wine and fruits. When the Romans divided the whole of Greece into Macedonia and A., the latter included all Greece excepting Thessaly. In the modern kingdom of Greece, A. forms, along with Elis, a *nome* or department, in the extreme n.w. of the Morea, and its chief t. is Patras (q.v.). Excepting the w. coast, the land is fertile, and produces corn,

wine and of —The ancient Achæans were, in a great measure, separated from the other people of Greece. Their twelve little towns, of which Egium was the chief, formed a confederacy, which was dissolved in the Macedonian times, but was renewed in 280 B.C., and subsequently extended itself, under the name of the *Achaean League*, throughout Greece, until 146 B.C., when Grecian liberty fell under the power of Rome.

**ACHALGANJ**, a t. of British India, in the s. part of the chief-commissionership of Oude, four m. n.e. from the Ganges, in n. lat. 26° 25', and e. long. 80° 35'. Pop. 5000, of whom 500 are Mohammedans, and the rest Hindoos.

**ACHARD**, FRANZ KARL, a meritorious naturalist and chemist, b. April 28, 1754, in Berlin, chiefly distinguished himself by his improvements in the process of preparing sugar from beet-root. In these labors he was supported by the king of Prussia. The results of his experiments were acknowledged as partly successful in 1799 and 1800; but were not carried into extensive application until the king gave to A. a farm in Lower Lusatia, where he founded a model manufactory of beet-root sugar. Here, after six years of experiments, conducted with the aid of Neubeck, a medical man, A. found out the true method of extracting beet-sugar; and in 1812, when the factory had become a very profitable investment, the king annexed to it a school for teaching the process of manufacture. A. was called to Berlin as director of the physical class in the academy of sciences, and died April 20, 1831. He wrote, among other similar essays, one on the *European Manufacture of Sugar from Beet* (Leip., 1803).

**ACHARD**, LOUIS, AMÉDÉ EUGÈNE, 1814-75; b. Marseilles. He began life as a merchant; became a Parisian journalist and royalist writer; accompanied the duke of Montpensier to Spain. In 1847 he published *Belle Rose*, a successful novel; later, *Miss Tempête*, *Histoire d'un Homme*, *Le Gros-Pommier*, *Pean qui Dort*, *La Misère d'un Billionnaire*, and *Madame de Sarcus*. He was an officer of the legion of honor.

**ACHATES**, friend and companion of Æneas in his wanderings after the fall of Troy. His faithfulness to the Trojan chief originated the saying, "Fidus Achates," applied to any faithful friend, though not properly to an equal in position.

**ACHATES**, a river in southern Sicily, now the Dirillo. Pliny says agates were first found there, whence their name, from that of the river.

**ACHEEN**, or **ACHIN**, a small kingdom in n.w. Sumatra, the only part of the island that has always resisted the Dutch; area about 16,500 sq.m., pop. est. from 50,000 to 230,000. The interior, never explored, is believed to be inhabited by tribes kindred with the Battas, a race of anthropophagi, adjoining on the south. On the e. coast are fertile plains, and in the interior high mountain ridges. Rice, pepper, cotton and tropical fruits are the chief productions. Horned cattle, horses and goats are plenty and of fine breeds. What religion there is, is Moslem; the inhabitants are divided into Achinese, Pedeeese, and Malays. The sultan is nominally the supreme power, but the real governor is his appointee, the shahbandar. There are two chiefs in each of the three subdivisions, whose offices are hereditary. The sultan must consult these six chiefs in any movement of importance, and they consult with chiefs of the second grade before giving decision. The six chiefs elect a new sultan from the reigning family, and may depose him for acts against their idea of public welfare. Each village has a chief, in large towns called rajah, who advises with the chief members of the community on important questions, and reports to his superior. The sultan's income is five per cent of the value of goods imported to Achee (the capital), but he gets only such as the six chiefs or the shahbandar may give him. Achee was visited by the Portuguese in 1505, the Dutch in 1583, and English in 1602. In 1659 the East India co. established a factory at the capital. England kept a protectorate over Achee until 1824, when it was transferred to Holland. In 1813 there was a rebellion against the Dutch, but the next year their capture of the capital ended it. The capital is the city of **ACHEEN**, 5° 35' n., 95° 19' e., near the n.w. point of Sumatra, on a river a mile from the ocean. Like most Malay towns, it is of timber and thatch, and the houses are scattered and poor. It was once a much larger town; at present it is important only as the residence of the sultan.

**ACHELOUS**, now called ASPROPO TAMO (i.e., White river, from the cream color of its waters), the largest river in Greece, rises in Mt. Pindus, flows through the land of the Dolopians, divides Ætolia from Acarnania, and falls into the Ionian sea. The extensive alluvial deposits at the mouth of this river have been observed from ancient times. It is said that the banks of the A. were anciently the haunt of lions.

**A'CHENBACH**, ANDREAS, b. Cassel, 1815; a German landscape and marine painter. He studied under Schadow; was made a royal academician of Berlin, and hon. member in Philadelphia and other cities; is a knight of the legion of honor, and took a medal of the first class in Paris in 1855.

**A'CHENBACH**, OSWALD, b. Dusseldorf, 1827, brother of Andreas, a painter after the style of the former.

**ACHENIUM**, **ACHENIUM**, or **AKENIUM**, a term now very frequently employed by botanists to designate a dry, hard, one-seeded, indehiscent fruit, in which the integuments of the seed are closely applied to it, but distinct from it. Such are what are popularly called the *seeds* of borage, and other plants of the same natural order. They were

termed nuts by Linnaeus. Sometimes the achenia are aggregated upon a common receptacle, forming what is called an *ataerio*, as in the ranunculus, in which they are placed upon a dry receptacle, or in the strawberry, in which the receptacle is fleshy. Sometimes the aggregated achenia are enclosed within the fleshy tube of the calyx, as in the rose. The fruit of the *compositae* is also sometimes called an A.; but a different appellation (*cypsela*) has been given to it, because the tube of the calyx coheres with the fruit, the name A. being limited to *superior* fruits.

ACHENWALL, GOTTFRIED, 1719-72, a chief promoter of the science of statistics. He studied at Jena and Leipzig; lectured at Marburg university on law, history and social science; and held a chair in the new university of Gottingen till his death. Though not the originator of the science of statistics, he was the first to formulate and define its purpose. Achenwall, it has been said, "defined politics as the theory of what a state ought to be; statistics the account of what it really is; and history the relation of how it became what it is." His wife, Sophie Elenore Walther, a rarely educated woman, wrote poems and essays.

ACHERON, the name given to several rivers by the ancients, always with reference to some peculiarity, such as black or bitter waters, or mephitic gases. The A. in Thesprotia, which flows through the lake Acherusia, and pours itself into the Ionian Sea; another river of the same name in Elis, now called Saccus; and several streams in Egypt, were supposed to have some communication with the infernal world. According to Pausanias, Homer borrowed from the river in Thesprotia the name of his infernal A., which the later poets surrounded with many imaginary horrors. Other lakes besides that above mentioned bore the name of Acherusia, e.g., the lake near Hermione in Argolis.

ACHERONTIA, or DEATH'S-HEAD MOTTH, a genus of lepidopterous insects; belonging to the family *sphinxidae*. There is a species in Europe (*acherontia atropos*) having on the back of the thorax a singular representation of a human skull; hence the name. It is a beautiful insect,  $4\frac{1}{2}$  in. long and 5 to  $5\frac{1}{2}$  in. expanse of wings, and if disturbed or handled it makes a squeaking noise. The ignorant and superstitious believe it to be a forerunner of evil. It drives bees from their hives and eats their honey, taking no hurt from stings. It is seen most frequently mornings and evenings in autumn. Its larva is a fat caterpillar 5 in. long, greenish-yellow, and beautifully marked on the back with blue and white lines and black spots.

A-CHEVAL POSITION. When troops are arranged so that a river or highway passes through the center and forms a perpendicular to the front, they are said to be drawn up in A. P. Wellington's army at Waterloo was *à-cheval* on the road from Charleroi to Brussels. In cases where a river forms a perpendicular to the front, secure possession of a bridge is necessary; otherwise one half of the troops might be routed, while the remainder stood idly as spectators.

ACHILL, or "Eagle" isle, off the w. coast of Ireland, is reckoned within the county of Mayo. It is  $15\frac{1}{2}$  m. long by  $12\frac{1}{2}$  m. broad, and has a very irregular coast-line, though its general shape is almost that of a right-angled triangle. It has a wild and desolate appearance; most of the surface is boggy; of the 35,000 acres which the island contains, not half a thousand are cultivated. There are three villages in A., and a number of hovels or huts scattered over its barren moors, sometimes in small clusters, forming hamlets, but so wretched as hardly to be fit for beasts. A. rises towards the n. and w. coast, where the mountains attain an elevation of 2000 ft. One of them, composed, like the rest of the island, wholly of mica-slate, presents, towards the sea, a sheer precipice from its peak to its base, a height of 2268 feet. There is a mission-station in the island, which forms an exception to the general wretchedness of the houses. It possesses, amongst other agencies of civilization, a printing-press. The population is gradually decreasing, from emigration and other causes; it amounted in 1871 to 6417.

ACHILLEA, a genus of plants of the natural order *composite* (q.v.), having small flowers (heads of flowers) disposed in corymbs, and the receptacle covered with chaffy scales (small bractes). The florets of the ray are female, and have a short, roundish tongue or lip; the florets of the disk are hermaphrodite, the tube of the corolla flatly compressed and two-winged; the involucre is imbricated.—The common YARROW or MILFOIL (*A. millefolium*) abounds in all parts of Europe and in some parts of North America—into which, however, it has perhaps been carried from Europe—growing in meadows, pastures, etc. It is about a foot in height; its leaves bipinnate, the pinnae deeply divided, the segments narrow and crowded. It has white or rose-colored flowers. The leaves have a bitterish aromatic, somewhat austere taste, and little smell; the flowers have a strong aromatic smell, with an aromatic bitter taste, and contain an essential oil, a resin, bitter extractive, gum, several salts, and traces of sulphur. Both leaves and flowers are used in medicine as a powerful stimulant and tonic. The leaves were formerly much used for healing wounds, and are still so employed by the common people in the highlands of Scotland and in some parts of the continent. The expressed juice is a popular spring medicine in Germany. Yarrow is often sown along with grasses intended to form permanent pasture for sheep; and *A. moschata*, called MUSK MILFOIL, is cultivated as food for cattle in Switzerland. *A. moschata*, *A. atrata*, and *A. nana*—all natives of the

Alps—are very aromatic, and bear the name of GENIFI or GENIPP. The inhabitants of the Alps value them very highly, and use them for making what is called *Swiss tea*. They are very stimulating and tonic; as are also *A. sativa* and *A. nobilis*, both natives of Switzerland and other middle parts of Europe, and *A. ageratum*, a native of the south of Europe, used by the French as a vulnerary, and called *herbe au charpentier*.—*SNIEZKOWIA* (*A. ptarmica*) is a native of Britain and other parts of Europe, 1 to 3 ft. high, with lanceolate leaves, and much larger flowers than the common milfoil. It grows in meadows and damp places. The root, which is aromatic, is used as a substitute for *pellitory of Spain* (q.v.), and the whole plant is pungent and provokes a flow of saliva.

**ACHILLES**, the hero of Homer's *Iliad*, was the son of king Peleus and Thetis, a sea-goddess, belonging to a line descended from Jove. Of his life before the Trojan war, and of his death after the fall of Troy, the poets after Homer first profess to give accounts. We are told that he was dipped in the river Styx by his mother, and was thus made invulnerable, except in the heel, by which he was held during the process; hence "the heel of A." became a proverbial phrase to denote any vulnerable point in a man's character. It had been prophesied at his birth that his life would be short; and, therefore, when the seer Calchas announced that without A. Troy could not be taken, his mother, to keep him from the dangers of the expedition, concealed him at the court of king Lycomedes, among whose daughters the boy lived disguised as a girl. But Ulysses discovered him by a stratagem. He offered to the young ladies a number of articles, some of feminine attire and others of arms; and the young warrior was betrayed by his choice. A., in the Greek campaign against Troy, appeared with fifty vessels manned by his followers, the Myrmidons; but remained sullen and inactive during a great part of the contest. When the city of Lyrnessus was taken, he had seized and carried away the beautiful Briseis, a pestilence in the Greek camp being ascribed to the anger of Apollo, whose priest had been robbed of his daughter, Chryseis, by Agamemnon, Agamemnon was compelled by the army to send Chryseis back to her father. On this, he took away Briseis from A., which greatly offended the latter. With this incident the *Iliad* begins. Neither the splendid offers made by Agamemnon, nor the disasters of the Greeks, could afterwards move A. to take any part in the contest, until his friend Patroclus was slain by Hector. The hero then buckled on his armor, which had been made for him by Vulcan, and of which the shield is described at great length by Homer. The fortunes of the field were now suddenly changed in favor of the Greeks; and the vengeance of A. was not satiated until he had slain a great number of the Trojan heroes and lastly, Hector, whose body he fastened to his chariot, and dragged into the Grecian camp. He then buried his friend Patroclus with great funeral honors. King Priam, the father of Hector, came by night to the tent of A., and prayed that the body of his son might be given back to the Trojans. A. consented; and with the burial of Hector the *Iliad* closes. We are told that soon after the fall of Hector, A. made a contract of marriage with Polyxena, the daughter of the Trojan king, but was slain by her brother Paris, in the temple of Apollo, where the marriage should have been celebrated. According to other accounts, he was slain by Apollo, who assumed the likeness of Paris as a disguise. His ashes were placed in an urn, with those of his friend Patroclus, and were buried on the promontory of Sigean, where, after the fall of Troy, the princess Polyxena, who had been made a prisoner, was offered as a propitiatory sacrifice.

**ACHILLES TATIUS**, an astronomer of the first part of the 4th c., who wrote a treatise on the sphere. There is a fragment of his writings extant, entitled *An Introduction to the Phenomena of Aratus*.

**ACHILLES TATIUS**, a native of Alexandria, who lived about the end of the 5th c., and wrote the *History of Leucippe and Clitophon*.

**ACHILLES' TENDON**, *Tendo Achillis*, attaches the soleus and gastrocnemius muscles of the calf of the leg to the heel-bone. It is capable of resisting a force equal to a 1000 lbs. weight; and yet is frequently ruptured by the contraction of these muscles in sudden extension of the foot. The name was given with reference to the death of the Grecian hero Achilles by a wound in the heel. Ancient surgeons regarded wounds or serious bruises of the A. T. as fatal.

**ACHILLEI, GIOVANNI GIACINTO**, b. Viterbo, 1803; a Dominican friar who left the Roman Catholic church in 1839 and published the New Testament in Italian, which is regarded as the best in that language. He went to England in 1850, brought suit for libel against Dr. Newman and got a verdict. He has been professor of Italian language and literature in the English college at Malta.

**ACHILLINI, ALEXANDER** 1469-1512; a Bolognese lecturer in medicine and philosophy, by some called the "Second Aristotle." He and Mundinus were the first dissectors of dead human bodies. A. was the author of several works, chiefly on anatomy.

**ACRIME'NES**, a genus of plants of the natural order *geraneaceae* (q.v.), much cultivated in stoves and greenhouses for the beauty of their flowers. The species are numerous—natives of the warm parts of America.

**ACHMIN.** See *ERIMM*, *ante*.

**ACHORES** are one of the forms of pustules—viz., that in which the pustules are very small, but have large inflamed bases. They are most common on the faces of children, and their secretion forms those large, thick, irregular scabs, resembling dried honey, which are so common on children's chins. They seem to be inflamed hair sacs or sebaceous follicles. Their treatment is the same as that for impetigo (q.v.).

**ACHEOMATIC** without color, the name applied to lenses and telescopes through which objects are seen without false colors, or, in other words, free from that colored fringe which, in the old telescopes, surrounded the object, and diminished its distinctness. The white, or rather colorless ray of light is composed of several colored rays which have various degrees of refrangibility. See REFRACTION, LIGHT, COLOR. When the direct ray is refracted, it divides itself into colored rays, deviating in various degrees from the right line of the primitive ray. The rays thus refracted by the convex object-glass do not meet exactly in one point, the focus of the glass, but rather at several points, so as to produce the various colors, red, blue and yellow, which surround the object. Newton, misled by imperfect experiments, believed it impossible to find any remedy for this defect; but Euler, in 1747, expressed his conviction that the desired A. improvement was practicable, and this belief was confirmed by the researches of the Swedish mathematician Klingenstierna. The practical solution of the difficulty was reserved for John Dollond; though, when he obtained a patent for his A. telescope, a priority of invention was claimed for a gentleman of the name of Hall. Dollond succeeded in forming an A. object-glass by a combination of crown-glass and flint-glass, which follow one law as to their relative refractive powers, and another as to their powers of dispersing the colors. By uniting a convex lens of crown-glass with a concave one of flint-glass, in certain relative dimensions, a reunion of the colored rays may be effected, and the object will be seen without false colors. In the construction of A. telescopes, Dollond was followed by his son Peter, and also by the optician Ramsden. A further improvement was made by Fraunhofer of Munich, who succeeded in producing perfectly pure glass—a very difficult achievement in the case of flint-glass. We owe an important improvement of the A. telescope to the Viennese optician Plössl, who has lately invented what he calls the dialytic telescope, in which the several kinds of glass composing the compound object-glass are not placed close together, but at regulated distances apart. This arrangement allows a shortening of the tube. See TELESCOPE.

**ACIDS.** An acid is a chemical compound distinguished by the property of combining with bases in definite proportions to form salts (q.v.). The most striking characteristics of A. are a sour taste, and the property of reddening vegetable blues. They are also mostly oxidized bodies; and at one time oxygen was thought to be essential to an acid, as the name *oxygen* (the acid-producer) indicates. Subsequent experience has extended the definition. There is an important class of undoubted A. that contain no oxygen; and silicic or flint, which, being insoluble, neither tastes sour nor reddens litmus-paper, is held to be an acid because it combines with bases and forms compounds like acknowledged A. The oxygen A., which are by far the most numerous class, are formed of elements (sulphur, nitrogen, chromium, etc., with two or more equivalents of oxygen. The elements that form the strongest A. with oxygen are the non-metallic, and most of them have more than one stage of acid oxidation. Thus sulphur, with two equivalents of oxygen, forms sulphurous acid, symbol  $\text{SO}_2$ ; with three equivalents it forms sulphuric acid, symbol  $\text{SO}_3$ . Similarly arsenic gives rise to arsenious acid ( $\text{AsO}_2$ ) and arsenic acid ( $\text{AsO}_3$ ). The higher stage of oxidation forms the stronger and more stable acid. All metals, except arsenic, that form A. with oxygen, have also, at a lower stage of oxidation, one or more oxides. To these oxygen A. must be added the organic A., composed either of carbon and oxygen, as oxalic acid ( $\text{C}_2\text{O}_3$ ), or of these two along with hydrogen, as acetic acid ( $\text{C}_2\text{H}_4\text{O}_3$ ) and formic acid ( $\text{C}_2\text{H}_2\text{O}_3$ ). There are also A. found in animal fluids or resulting from their decomposition, which contain nitrogen in addition to the three elements above named; such is uric acid ( $\text{C}_{10}\text{N}_4\text{H}_4\text{O}_6$ ). The *hydrogen* A. are formed of hydrogen and a radical, either simple or compound. The most important of these, and the type of its class, is hydrochloric or muriatic acid ( $\text{ClH}$ ); others are hydriodic ( $\text{IH}$ ) and hydrocyanic A. ( $\text{NC}_2\text{H}$ ). As all A., however, even oxygen A., possess acid properties—i.e., combine with bases—only when in combination with water, a new view of the constitution of A. is beginning to prevail, which makes hydrogen the real acidifying element in all A. Thus, instead of considering vitriol as a compound of sulphuric acid and water ( $\text{SO}_3 + \text{HO}$ ), the hydrated acid is held to be the real sulphuric acid, and its rational formula to be ( $\text{SO}_3\text{H}$ ). It thus becomes analogous to hydrochloric acid ( $\text{ClH}$ ). This view has not only the advantage of bringing all A. into one class, but makes the theory of their combination with bases and of their capacity of saturation uniform and simple. See CHEMISTRY.

**ACILIUS GLABRIO, MANTUS**, a Roman general and consul 191 B.C. From plebeian origin he rose to the highest places: supplanted Cornelius Scipio; commanded as consul against Antiochus the great in Syria, defeated him at Thermopylae, and subsequently waged successful war against the Æolians, receiving a triumph on return to Rome. He wrote the annals of Rome in Greek, and was the first man to whom a golden statue was erected in Italy.

**ACI REALÉ**, a t. of Sicily, in the district of Catania. It lies at the foot of Mt. Etna, on the coast, where the small river Aci, flowing from Etna, enters the sea. The t. is built of lava, is defended by a fortress, and contains (1871) 26,692 inhabitants, who are employed chiefly in the manufacture of linen and silk; it also carries on a not inconsiderable trade in flax and grain. Many of the edifices are very handsome. A. R. is famed for its mineral waters, and for the cave of Polyphemus and the grotto of Galatea in its vicinity.

**ACIS**, the son of Taurus and Symæthus, beloved by Galatea. Being jealous of him, Polyphemus the cyclop crushed him under a rock, and his blood gushing forth was changed into the river Acis, or Acinum, at the foot of Mt. Etna.

**ACKERMANN, CONRAD ERNST**, b. 1710, d. Hamburg, 1771; a comedian and one of the founders of the German stage. He first acted in 1740; gathered a company traveled through the country, and established the celebrated Hamburg theater, whose performances inspired Lessing to write his comments on dramatic art.

**ACKERMANN, RUDOLPH**, a native of Saxony in Germany: b. 1764, d. 1834; came to London, where he opened a repository of the fine arts in the Strand, which succeeded well. He introduced the art of lithography into England, and was the originator of the *Annals* (q.v.), which he commenced by his *Forget-me-not*, published in 1823 and following years. Among his numerous illustrated publications may be mentioned his *Repository of Arts, Literature and Fashions*; *Microcosm of London*; *Westminster Abbey*; and *Universities of Oxford and Cambridge*. English wood-engraving, the art of water-proofing and the introduction of gas light into shops were greatly promoted by this enterprising German. He was chief promoter of the subscription (1813) for the sufferers by the war in Germany.

**ACKERMANN, SOPHIE CHARLOTTE**, wife of Conrad Ernst, and before that widow of Schröder the organist; distinguished as an actress and histrionic teacher, but more famous as the mother of Freder.

**ACLAND, HENRY WENTWORTH**, a grand-nephew of John Dyke, a physician and promoter of sanitary reform; accompanied the Prince of Wales to America in 1860 as his medical attendant.

**ACLAND, JOHN DYKE**, an English officer in the American revolution, commanding grenadiers at the battle of Stillwater, Oct. 7, 1777. He was shot in the head by a storming party under Arnold. His wife was Harriet, daughter of the Earl of Rochester, and showed great heroism in forcing her way to him after the fight. She wrote an account of the campaign. In 1778 Acland returned to England, where he resented remarks disparaging to Americans by Lieut. Lynch, who challenged and killed him. His wife was insane for two months afterwards.

**ACLINIC LINE** an imaginary line around the earth between the tropics, where the needle has no declination. It is called the magnetic equator, and is about 70° from the magnetic poles. The line is variable and irregular; in the western hemisphere it is s. and in the eastern n. of the geographical equator.

**ACNE**, (probably from Gr. *akme*, an efflorescence) is an important skin disease. It is placed by some dermatologists in the order *pustula*, and by others in the order *tubercula*, which includes solid, hard elevations of the skin, much larger than *papula*. The sebaceous follicles of the skin (q.v.) are the primary seat of the affection. Their natural secretion accumulates in their interior, and there is, at the same time, a tendency to inflammation of the follicle and surrounding tissue. It is by no means rare to find on the face and shoulders of young persons about or above the age of puberty a number of black spots, each of which is placed on a slightly-raised pale base. These black points are called *comedones*. Pressure at the base occasions the expulsion of a little, elongated, spiral, white mass, with a black point or anterior end, commonly but erroneously regarded as a worm.\* Interspersed are other spots, with the base more raised and inflamed, which become more or less perfect pustules, each of which rests on a comparatively large red base. In some of the inflamed follicles coagulated lymph (to use the old phraseology) is thrown out, and a small hardened mass is the result. According as one or other of these appearances preponderates, we have different varieties of this disease. When the pustule is the most striking feature, the affection is called *acne simplex* or *vulgaris*; when the black points abound, it is *acne punctata*; and when there is decided induration, it is *acne indurata*. We have already mentioned the age at which this affection commonly occurs: it is never seen in children, and is rare in aged persons.

As long as there is no inflammation, the treatment simply aims at favoring the escape of the contents of the sebaceous follicles, by rubbing the face and other affected parts with cold cream at bed time, washing the next morning with soap and water, and gentle subsequent friction with a soft towel. When acute inflammation is present, and the pustules are very tender, there is no better application than tepid water, with or without a little gelatine in solution; and subsequently the ointment of the hypochlorite of sulphur has been found useful by Wilson and others. *Acne indurata*, which is the least

\*In the midst of the white mass of sebaceous matter, a parasite, *acarus folliculorum* is, however, often found.

tractable of the three forms, is sometimes benefited by the application of fly-blisters. In all these cases the state of the digestive organs must be carefully attended to.

*Acne rosacea* is, according to some writers, a much more grave variety of acne; while others regard it as a special disease, to which they assign the name of *rosacea*, under which term it is described in this work.

**ACCE MAT.E**, a class of Greek monks called watchers, who chanted service continuously day and night, dividing like sailors into three watches. They originated in the 5th c., near Constantinople, and established many monasteries. Some were denounced for favoring Nestorianism.

**ACOLYTES**, a name occurring first about the 3d c., and applied to functionaries who assisted the bishops and priests in the performance of religious rites, lighting the candles, presenting the wine and water at the communion, etc. They were considered as in holy orders, and ranked next to sub-deacons. These services have, since the 7th c., been performed by laymen and boys, who are improperly called A.; but in the Romish church, aspirants to the priesthood are still at one stage consecrated as A., receiving candles and cups as the symbols of the office. See **ORDERS, HOLY**.

**ACOMA**, a village in New Mexico, the Acuna of Spanish historians; 35° 24' n., 106° 19' w.; an old Indian t. built on a rock 400 feet high and reached only by spiral stairs cut in the stone. It has a church and missionary station.

**ACONCAGUA**, a province of central Chili; 6000 sq.m.; pop. '68, 130,672. In the e. part are the Andes, with fertile valleys and many rivers running to the Pacific; there are copper, silver and gold mines. The w. part is artificially irrigated, and produces large crops of cereals and superior hemp. Rain is scarce, and natural vegetation light. The province is divided into four departments: Andes, Ligna, Petora and San Felipe. Capital, San Felipe d'Aconcagua, at the foot of the Andes, 55 m. n.e. from Valparaiso; pop. 7000.

**ACONCAGUA**, the highest known mountain peak in the western hemisphere, n.e. of San Felipe, 32° 39' s., 70° w. The latest measure makes the height 6834 metres, or 22,432 ft. (4,245 m.), 997 ft. higher than Chimborazo. The cone is an angular, serrated mass, bare of vegetation, and without sign of volcanic action. It is a grand sight from Valparaiso.

**ACONITE**, (*Aconitum*), a genus of plants of the natural order *ranunculaceæ* (q.v.), having five petaloid sepals, of which the upper one is helmet-shaped, and two hummer-headed petals concealed within the helmet-shaped sepal. The fruit consists of 3 to 5 follicles. *A. napellus*, the common WOLF'S-BANE or MONK'S-HOOD, often cultivated in flower-gardens for the sake of its erect racemes of blue flowers, is a somewhat doubtful native of England, but common in some parts of Europe. The roots are fusiform and clustered. The root and whole plant are very poisonous, containing an alkaloid called *aconitin* or *aconitine*, one of the most virulent of all known poisons; but an extract of the leaves is a valuable medicine, administered in small doses for nervous and other diseases. An A., sometimes called *A. stoeckianum*, but generally regarded as a variety of *A. cammarum* (also known as *A. paniculatum*), was brought into great repute on the continent during the last c. by Dr. Stoerck, an Austrian imperial physician, and is still much cultivated for medicinal use. The same properties seem, in greater or less degree, to belong to a number, if not to all, of the species of this genus, and they contain the same alkaloid. The virulent *bikh* poison of India, equally fatal in its effects whether introduced into wounds or taken into the stomach, is prepared from the roots of several species. The *A. ferax* of Nepal, from which much of it is obtained, has been identified by Drs. Hooker and Thompson with *A. napellus*. Two other Himalayan species, *A. palmatum* and *A. luridum*, are equally employed in its preparation. *A. album*, or white-flowered monk's-hood, a native of the Levant, and *A. lycoctonum*, yellow-flowered monk's-hood, or wolf's-bane, a native of the Alps, are not unfrequent in our flower-gardens.

**ACONITE, WINTER**, an herbaceous, tuberous plant, without stem, bearing in early spring bright yellow cup-shaped flowers; leaves smooth, pale green, and peltate, scape low and single flowered.

**ACORN-SHELL**. See **BALANUS**.

**ACORUS**, a genus of plants of the natural order *aroidæ* (see **ARUM**), or, according to other botanists, of the natural order *aristaceæ*, which is regarded as a connecting-link between *aroidæ* and *juncæ*. The plants of this genus have a leaf-like scape, which bears upon its side a dense, cylindrical, greenish spike of flowers, with 6-partite herbaceous perianth and six stamina in each flower. To this genus belongs the SWEET FLAG (*A. calamus*), which was long ago brought from Asia, and in the 15th c. was planted in the gardens of princes and rich men, but has now become naturalized in England, Germany, etc., growing in marshes and ditches. Its root (rhizome) is perennial, divided into long joints about the thickness of the thumb, has a bitterish acid taste, and is very aromatic. It is a powerful medicine of transient tonic effect, occasionally used, especially in cases of weak digestion. In many places of the continent it is to be found in every confectioner's, cut into slices, and prepared with sugar. It is also used to correct the empyreumatic

odor of spirits, and to give them a peculiar flavor. It is called *calamus root*. In Britain it is chiefly employed by perfumers in the manufacture of hair-powder.—The other species of *A.* are likewise aromatic, and are applied to the same uses. *A. gramineus* is cultivated in China.

**ACOSTA, GABRIEL**, a Portuguese nobleman, descended from a Jewish family; b. at Oporto, in 1587. After being educated in the doctrines of the Roman Catholic church, he became skeptical, and leaving Portugal, went to Amsterdam, where he adopted the Jewish faith. He did not remain long contented with his new creed; but wrote against the Pentateuch, disputed the doctrine of the soul's immortality, and became involved in controversy with his rabbinical teachers. On account of his work, entitled *Examen de Tradicoens Pharisaicas conferidas com a ley Escrita* (Examination of Pharisaic Traditions compared with the Scriptures), 1624, he was charged with atheism by the Jews before a Christian magistracy. Having lost his property, and being sentenced to a seven years' excommunication, he sought reconciliation with the synagogue, and submitted to very ignominious chastisements, which were repeatedly inflicted as often as his religious doubts arose again; until, in a state of insanity, he ended his career by suicide in 1640, or, as others say, in 1647. His autobiography was published in Latin and German (Leip. 1847).

**ACOSTA, JOAQUIN**, a col. of engineers, geographer and historian; in the Columbian army in 1831; in 1834, with Céspedes the botanist, undertook a scientific expedition from the valley of the Secorro to that of the Magdalena, and seven years later visited the country from Antiocha to Anserma; went to Spain, where he lived several years. His chief work is *The Discovery and Colonization of New Granada*. He also made a map of that republic, and furnished essays to the Paris geographical society.

**ACOSTA, JOSE D'**; b. 1539, d. 1600; was educated a Jesuit and made professor of theology; was sent missionary to South America, and on return was superior of Valladolid and rector of the university of Salamanca, where he died. His work, *The Natural History of the Indies*, is high authority, and known in many languages.

**ACOSTA, URIEL D'** (see **ACOSTA, GABRIEL**, *ante*), a Portuguese nobleman, educated in the Roman Catholic church. He changed his name from Gabriel on adopting the Jewish faith. Doubt attaches to the story of his suicide.

**ACOTYLEDONOUS PLANTS** (*acotyledones* of Jussieu), one of the great primary classes into which the vegetable kingdom is divided, according to the structure of the seed and whole development therewith connected. See **COTYLEDON**. The class of *acotyledones* contains those plants which, in the Linnean system, form the class **CRYPTOGAMIA** (q.v.). It consists partly of *acrogenous plants* (q.v.), as ferns and mosses, and partly of *thallogamous plants* (q.v.), as lichens, fungi and algae. It thus includes the vegetable tribes of lowest organization, whose embryo exhibits no distinct seed-lobes (cotyledons), but is a mere cell or *spore*, with granular matter in its interior, and germinates indifferently from any point of its surface.

• **ACOUSTICS** (Gr. *akouo*, I hear) is the science of sound. This part of physics is often treated in connection with the atmosphere—an arrangement that seems inappropriate; for the atmosphere is only the most common conductor of sound; and every substance, whether solid or fluid, is capable, as well as air, of sounding itself, or of conveying the sound of other bodies. *A.* is rather a part of the science of motion. All motion is either rectilinear, circular, or vibratory; and when a vibratory motion is quick enough to affect the sense of hearing—for which at least thirty vibrations in a second are required—it constitutes a sound. A definable, uniform sound is a note or tone, and the rapidity of the vibrations is its pitch; a confused indeterminate sound is a noise. The chief subjects treated of in *A.* are: 1. Musical sounds, or notes (q.v.). Here the question is concerning the absolute and relative velocities of the vibrations, and those modifications, called temperament, to which their original proportions are subjected for the practical purposes of music. 2. The origin of sound (q.v.), and the laws which guide the vibrations of sounding bodies, and which give rise to different phenomena in different substances. In all sounding bodies, it is elasticity that is to be looked upon as the moving power. The elasticity of a sounding body may arise from stretching, as in the strings of a violin or the head of a drum, or from its own stiffness, as in rods, bells, etc. 3. The propagation of sound, as well through the air and other gases as through solids and liquids; and the reflection of sounds or echoes. All elastic bodies conduct sound, many much more powerfully than air. In water the conducting power is four times stronger than it is in air; in tin, seven times; in silver, nine times; in iron, ten times; in glass, seventeen times. 4. Perception of sound, or the structure and functions of the ear (q.v.).

The ancients had made attempts to cultivate *A.* Pythagoras and Aristotle were aware of the way that sound is propagated through the air, but as a science independent of its application to music it belongs almost entirely to modern times. Bacon and Galileo laid the foundation of this new mathematical science; Newton showed by calculation how the propagation of sound depends upon the elasticity of the atmosphere or other conducting medium. He observed that a sounding body acts by condensing the portions of air that lie next it, and in the direction of the impulse. These condensed portions then spring back by their elasticity, and at the same time impel forwards the portions lying next them.

Each separate portion of air is thus driven forwards and backwards; and thus all round the sounding body there is an alternate condensation and rarefaction of air, constituting, as it were, waves of sound. In determining the velocity of sound, Newton, Lagrange and Euler erred in their calculations; the best researches on this subject are those of Laplace. Chladni first raised A. to an independent science. In recent times, comparatively little has been done in this branch of physics. Savart has determined more exactly the number of vibrations in a second necessary to produce an audible sound; and Cagniard de Latour invented the siren, and discovered many of the conditions under which both solids and fluids sound. The sounding of heated metals, when laid on cold metallic supports, has occasioned much discussion. See *Edinb. Phil. Journal*. Faraday and Marx have examined the figures of sound; Wheatstone, the phenomena of sympathetic sounds; and Willis, the formation of vowel-sounds by the human voice.

While the principles of A. are well known in theory, they are seldom carried out to a satisfactory result in practice. We allude more particularly to the many instances in which costly assembly halls and churches are defective as regards public speaking; it being seemingly a mere chance that new edifices of this kind exhibit proper acoustic qualities. In some cases, the sounds uttered cause echoes and reverberations, perplexing alike to a speaker and his auditory, and in others the sounds are dispersed at a high elevation and are lost. This subject urgently demands consideration in connection with architecture. As a general rule, the ceilings of halls should be at a moderate elevation; the lowering of a ceiling and the removal of chandeliers have been known to improve the speaking and hearing properties; and the hanging up of flags and draperies has, in a variety of instances, had a similarly good effect. The whispering gallery of St. Paul's, London, offers an interesting example of one of the phenomena in acoustics. See Echo.

**ACOUSTICS** (*ante*). The velocity of sound has been determined by ascertaining the time intervening between the flash and report of a gun, as observed at a given distance, and dividing the distance by the time. After many experiments in various countries Van der Kolk assigned 1091 ft. 8 in. per second, with a probable error of 3.7 ft. as the velocity of sound in dry air at 32° Fahr. More recent experiments by the astronomer royal at the cape of Good Hope, give 1093 ft. To this velocity may be added 1.11 ft. for each degree Fahr. But air is not a perfect gas, and the variations of elastic force, caused by a wave of sound passing through it are not uniform; so these measures, though approximately, may not be absolutely, correct. Furthermore, the rapidity of transmission depends upon the loudness of the sound; and capt. Parry found, in the polar regions, that the discharge of a cannon at a distance of 2½ m. was heard perceptibly sooner than the word ordering to fire, which, of course, preceded the discharge. There is also a gradual falling off in the speed of sound; and Regnault determined that sound decreased in speed by 2.2 ft. per second in passing from a distance of 4000 ft. to one of 7500 ft. He also found that the velocity depended upon the pitch, the lower notes traveling faster than the higher ones; thus, the fundamental note of a trumpet travels faster than its harmonies. Sound travels faster in liquids than in air, and faster in solids than in liquids. In the river Seine, at 59° Fahr. the speed was 4714 ft. per second. Through iron, sound travels ten and a half times faster than through air. Experiments on telegraph wire produce almost identical results. Different metals transmit sound in widely different degrees. Wertheim assigned 16,822 for iron and 4030 for lead, at a temperature of 68° Fahr. Except in a few cases, the loudness of a sound is less as the distance increases between the source of the sound and the ear. In an unlimited and uniform medium, the loudness of the sound proceeding from a very small sounding body varies inversely as the square of the distance. But to verify this fact it would be necessary to make a test at a considerable elevation above the earth's surface, the ear and source of sound being separated by air of constant density. As the density of the air diminishes, it would be found that the loudness of a sound at a given distance would decrease. The decay of sound due to this cause is observable in the rarefied air of high mountain regions. De Saussure found that the report of a pistol at a great elevation appeared no louder than would a small cracker at a lower level. But it must be stated that when air-strata of different densities are interposed between the sound and the ear placed at a given distance, the intensity depends only on the density of the air at the source itself; whence it follows that sounds proceeding from the surface of the earth may be heard at equal distances as distinctly by a person in a floating balloon as by one situated on the surface itself; whereas any noise originating in the balloon would be heard at the surface as faintly as if the ear were placed in the rarefied air on a level with the balloon. This was exemplified by Glashier, the aeronaut, who, at an elevation of 20,000 ft. heard with great distinctness the whistle of a locomotive passing beneath him. The prolonged roll of thunder, with its manifold varieties, is partly to be ascribed to the reflection of the sound by mountains, clouds, etc., but is mainly due to the comparatively low rate of transmission through air. The explanation will be more easily understood by noting the case of a volley fired by a long line of troops. A person at a given point in the line would hear the sound of the nearest musket first, and of the others in the order of distance, and the effect would be a prolonged roll, concluded by the musket most remote from the hearer. Though all were

fired at the same instant; and the roll would gradually decrease in loudness. If he stood exactly opposite the centre of the line, the reports from either end would reach him simultaneously and the effect would be more nearly a loud crash. If the soldiers formed a circle, the listener in the centre would hear a single explosion, since the report of every gun would reach his ear at the same instant, and the whole explosion would be equal to that of the sum of all the separate discharges. By varying the form of arranging the troops, corresponding variations in the sound would be produced. Keep in view, then, the fact that flashes of lightning may be regarded as representing lines of troops, at the points and along the ranks of which explosions are generated at the same instant of time; then consider the variety of distance and position relative to the electric discharge of the listener, and we find no difficulty in accounting for the rolling peals of thunder. In a mountainous region this rolling is greatly augmented by reverberations or echoes from the steep declivities.

**ACQUAVIVA**, a t. of s. Italy, in the province of Bari, 16 m. s. of the t. of Bari, in a healthy situation at the foot of the Apennines. It is surrounded with walls and ditches, has a handsome parish church, several convents, two hospitals, etc. Pop. 7690.

**ACQUAVIVA**, CLAUDIO D', a general of the Jesuits; b. in Italy; he regulated the studies of the order, and prohibited the discussion of tyrannicide. His *Ratio Studiorum* is still considered authority.

**ACQUI** (Lat. *Aqua Statiella*), a walled t. of n. Italy, on the left bank of the Dormida, 18 m. from Alessandria. It derives its name from its hot sulphur springs, which were known to the Romans, and which are much frequented by invalids. The t. is of great antiquity, and contains many remarkable ecclesiastical buildings. Pop. 8200.

**ACRE**. The word is identical with Lat. *ager*, Gr. *agros*, "a field;" the Ger. *acker* means both "a field" and a "measure of land." Most nations have some measure nearly corresponding; originally, perhaps, the quantity which one plow could plow in a day; uniformity, therefore, is not to be looked for.

The English statute A. consists of 4840 sq. yards. The chain with which land is measured is 22 yards long, and a sq. chain will contain  $22 \times 22$ , or 484 yards; so that 10 sq. chains make an acre. The acre is divided into 4 roods, a rood into 40 perches, and a perch contains 30½ sq. yards. The Scotch A. is larger than the English, and the Irish than the Scotch. 121 Ir. ac. = 196 Eng. nearly; 48 Sc. ac. = 61 Eng. The following table shows the values of the more important corresponding measures compared with the English A. The German morgen below are becoming obsolete, as the German empire has adopted the French metrical system.

English acre.....	1.00	Prussia { little morgen.....	0.63

**ACRE**, St. JEAN D', or ACCA, the biblical *Accho*, known as *Ptolemais* in the middle ages, is a sea-port on the coast of Syria, not far from the base of Mt. Carmel, and contains 10 to 15,000 inhabitants. The harbor is partly choked with sand, yet is one of the best on this coast. A. has often been the arena of warfare, and has suffered many changes of fortune. In 1004, it was taken by the Genoese; in 1187, by the sultan Saladin; afterwards it became the chief landing-place of the crusaders, the seat of a bishop and of the order of St. John; next, it fell into the hands of the Egyptians; and in 1517 was captured by the Turks; in 1799, it was besieged by the French for sixty-one days, but was successfully defended by the garrison, aided by a body of English sailors and marines under Sydney Smith. In 1832, it was stormed by Ibrahim Pacha, son of the viceroy of Egypt, and continued in his possession till it was bombarded and taken, in 1840, by a combined English, Austrian, and Turkish fleet. See EGYPT.

**ACRELIUS**, ISRAEL, 1714-1800, b. in Sweden; studied at Upsal; was ordained in 1743; appointed provost of the Swedish congregation on the Delaware; came to America and was pastor of the church at Christiana. After several years he returned to Sweden, and received a pension and a church living. He wrote a description of the Swedish settlements in America.

**ACRI**, a t. of s. Italy, in the province of Cosenza, 13 m. n.e. of the t. of Cosenza, in a beautiful and healthy situation, with a fertile country around. Pop. 9500.

**ACRITOCROMACY** (Gr. *akritos* and *chromatia*, which, when associated, imply "inability to discriminate between colors") is a term which seems likely to supersede *color blindness*, *dallanism*, *achromatopsia*, etc.

**ACROBAT**, a word derived from the Greek, and nearly synonymous with rope-dancer. It literally signifies one who walks on tip-toe (*akron*, an extremity, and *baino*, I go); and is employed to designate those who perform difficult feats, vaulting, sliding, tumbling, and dancing on a slack or tight rope, stretched either horizontally or obliquely. These feats require great skill, suppleness, and steadiness. For a long time, acrobats were contented to divert and astonish only children or the most ignorant of the populace; but the extraordinary skill of some recent performers has given this perilous art a great celebrity. Within the present century, Farioso, Madame Saqui, and Signor Diavolo have excited admiration by their marvellous agility; Blondin was even more widely known. The acrobats of antiquity appear to have closely resembled those of our own day.

**ACROCERAUNIA**, in ancient geography a promontory in the n.w. of Epirus, terminating in Montes Ceraunii: now cape Linqueeta; lat.  $40^{\circ} 25' N$ . The frequent striking of lightning at or near the mountain gave the name, which is equivalent to "thunderbolt peak."

**ACRO CORINTHUS**, a steep hill of 2000 ft., near Corinth; the site of the Acropolis or citadel, and commanding a beautiful view.

**ACROGENOUS PLANTS** (Gr., growing at the summit) are plants in which the structure of the stem is *acrogenous*—that is, in which the vascular bundles are developed simultaneously, and not in succession, the stem increasing by the coherence of the bases of the leaves and by elongation at the summit. In a transverse section of stem a circle of vascular tissue is found near the circumference, and the centre is composed of cellular tissue, some portion of which frequently disappears, so that the stem, although solid when young, becomes hollow in a more advanced stage of its growth. Tree-ferns afford the finest specimens of the acrogenous stem. All A. P. have *stomata*, or breathing-pores, on the surface. In general, they have a distinct stem and leaves arranged with most perfect symmetry. Some plants, in which the distinct stem is absent, are ranked with

Section of Acrogenous stem.

Tree Fern.

A. P., because the *thallus* has the texture of leaves, and exhibits a higher organization than in *thallogamous plants* (q.v.). A. P. are all *acotyledonous* (q.v.); and under this designation are included *ferns*, *equisetaceae*, *lycopodiaceae*, *marileaceae*, *mosses*, and *hepaticeae*.

**ACROLEIN** ( $C_4H_4O_2$ ) is a colorless, limpid, strongly refracting liquid, lighter than water, and having its boiling-point at about  $125^{\circ}$ . It constitutes the acrid principle produced by the destructive distillation of fatty bodies, and is in part due to the decomposition of glycerine. It is best prepared by distilling a mixture of glycerine and anhydrous phosphoric acid, the object of the latter being to effect the removal of the element of four atoms of water from the glycerine ( $C_6H_8O_6$ ), which contains the elements of acrolein ( $C_4H_4O_2$ ) + those of four atoms of water ( $H_4O_4$ ). In its state of vapor it is extremely irritating to the eyes, nostrils, and respiratory organs—a property to which it owes its name. The pungent smell given off by the smoldering wick of a candle just blown out is due to the presence of acrolein. When mixed with a solution of potash or soda, the irritating odor disappears, and is replaced by one of cinnamon; while a brown resinous substance is formed; and certain oxidizing agents, as oxide of silver, convert it into *acrylic acid* ( $C_4H_4O_4$ ).

**ACROLITHS** (Gr. *akron*, extremity; *lithos*, a stone), the name given to the oldest works of Greek plastic art, in which wood-carving is seen in transition into marble statuary. The trunk of the figure is still, in the old style, of wood, covered with the usual temple vestments; but the extremities—head, arms, feet—which are meant to appear naked from below the drapery, are of stone.

**ACRON**, a physician of Sicily in the 5th c. B.C., who is said to have originated the practice of stopping pestilence by purifying the air with large fires, though this is doubtful. He wrote several works on medical subjects, but none of them are extant.

**ACROPOLIS**, "the highest point of the city." Many of the important cities of Greece and Asia Minor were protected by strongholds, so named. The A. occupied a lofty position, commanding the city and its environs; inaccessible on all sides except one, which had, for the most part, artificial defenses. It contained some of the most important public buildings, especially temples, besides affording a last refuge in case of a hostile attack. The A., like the castle of the middle ages, had formed the center or nucleus

around which the town gradually grew. Among the most celebrated of the ancient A.s was that of Argos, whose name, Larissa, indicates its Pelasgic origin; that of Messenia, which bore the name of Ithome; that of Thebes, called Cadmea; that of Corinth, known as Acro-Corinthus; but especially that of Athens, which was styled pre-eminently the A. See **ATHENS**.

**ACROS TIC** is a Greek term for a number of verses the first letters of which follow some predetermined order, usually forming a word—most commonly a name—or a phrase or sentence. Sometimes the final letters spell words as well as the initial, and the peculiarity will even run down the middle of the poem like a seam. Sir John Davies composed twenty-six *Hymns to Astrea* (Queen Elizabeth), in every one of which the initial letters of the lines form the words **ELISABETHA REGINA**. The following is one of the twenty-six:

E v'ry night from ev'n to morn,  
L ove's chorister amid the thorn  
I s now so sweet a singer;  
S o sweet, as for her song I scorn  
A pollo's voice and finger.  
  
B ut, nightingale, sith you delight  
E ver to watch the starry night,  
T ell all the stars of heaven,  
H eaven never had a star so bright  
A s now to earth is given.  
  
R oyal Astrea makes our day  
E ternal with her beams, nor may  
G ross darkness overcome her;  
I now perceive why some do write  
N o country hath so short a night  
A s England hath in summer.

In the A. poetry of the Hebrews, the initial letters of the lines or of the stanzas were made to run over the letters of the alphabet in their order. Twelve of the psalms of the Old Testament are written on this plan. The 119th Psalm is the most remarkable. It is composed of twenty-two divisions or stanzas (corresponding to the twenty-two letters of the Hebrew alphabet), each stanza consisting of eight couplets; and the first line of each couplet in the first stanza begins, in the original Hebrew, with the letter *aleph*, in the second stanza with *beth*, etc. The divisions of the psalm are named each after the letter that begins the couplets, and these names have been retained in the English translation. With a view to aid the memory, it was customary at one time to compose verses on sacred subjects after the fashion of those Hebrew acrostics, the successive verses or lines beginning with the letters of the alphabet in their order. Such pieces were called *Alphabetical Hymns*. See *Hook's Church Dictionary*.

**ACROTERION** (Gr., the summit or extremity), a term in arch. for a statue or other ornament placed on the apex or at one of the lower angles of a pediment. Some understand by A. the pedestal on which such ornament stands.

**ACT**, in the drama, is a distinct part of the general plot or action, and its conclusion is usually marked by a fall of the curtain. An act should be, in a certain sense, complete in itself, and at the same time should form a necessary part of the whole drama. As every dramatic plot naturally divides itself into three parts—the exposition, the development, and the conclusion or catastrophe—a division into three acts would seem most natural; but in practice it has been found inconvenient to inclose extended plots in such limits, and since the time of the ancient Greek tragedy, *five* acts have generally been considered necessary. In the first act, the general nature of the drama is indicated, the characters are introduced, and the action commences. The plot should rise in interest in the second, and reach its climax in the third act. In the fourth act, the conclusion or catastrophe should be prepared, but should by no means be anticipated so as to weaken the effect of the *dénouement*, which must occupy the fifth act. This is a rather difficult task; and, accordingly, many dramas fail in the fourth act.

**ACT**, in the university sense, is an exercise preparatory to receiving a degree. The student who "keeps the act," and who is called the "respondent," reads a Latin thesis on some proposition which he has announced that he is to maintain. Three other students, who have been named by the proctor as "opponents," then try, one after another, to refute his arguments syllogistically in Latin. The practice of keeping acts is still adhered to, as a form at least, at Cambridge.

**ACT**, in law, has various meanings. In its more general acceptance it is used to denote the solemn accomplishment of some distinctive proceeding, as when a person in England, when executing a legal instrument, declares it to be his *act and deed*. Formerly, in Scotland, the word A. was frequently applied to the procedure in a litigated cause; and to this day the technical term to signify a plaintiff in Scotch pleading is *actor*—hence also *acts of sederunt* (q.v.). By an A. is sometimes meant an act or proceeding, or rather the record of an act or proceeding, of a public nature—and in this sense it is used when we speak of an *A. of parliament* (q.v.). This use of the word appears to be derived from the Romans, who employed *acta* to signify specially public official transactions, and oftener perhaps the records of such transactions. The *Acta Diurna* was a kind of official Roman

gazette, giving an account of the public transactions and events of the day. The Germans use *acten*, and the French *actes*, to signify official or legal documents, or papers generally. The title *acta* has been applied in modern times to the journals or records of learned societies: *acta societatis regiae*—the transactions of the royal society. *Acta Eruditorum*, the oldest journal of erudition in Germany, was begun at Leipsic in 1683, and ceased publication in 1783, when it had extended to 117 quarto volumes. To these may be added (showing the close connection between the Roman and Scotch legal institutions and their phraseology) the *acta auditorum*, or the records of the proceedings of the lords auditors, who were a committee of the old Scotch parliament appointed to hear causes, by way of appeal, and otherwise to exercise supreme jurisdiction. Also the *acta dominorum concilii*, or ancient records of the supreme court in Scotland.

But the word *A.* has at the present day several precise legal applications, the principal of which we now proceed to mention and explain:

**ACT OF BANKRUPTCY**, by which is meant a certain ostensible indication of insolvency on the part of a debtor, sufficient to bring him within the operation of the bankrupt laws. Section 67 of the former bankrupt law consolidation act, 13 and 18 Viet. c. 103, defined *A. of B.* in the following terms: "That if any trader, liable to become bankrupt, shall depart this realm, or being out of this realm, shall remain abroad, or shall depart from his dwelling-house, or otherwise absent himself, or begin to keep his house, or suffer himself to be arrested or taken in execution for any debt not due, or yield himself to prison, or suffer himself to be outlawed, or procure himself to be arrested or taken in execution, or his goods, money, or chattels to be attached, sequestered, or taken in execution, or make or cause to be made, either within this realm or elsewhere, any fraudulent grant or conveyance of any of his lands, tenements, goods, or chattels, or make or cause to be made any fraudulent surrender of any of his copyhold lands or tenements, or make or cause to be made any fraudulent gift, delivery, or transfer of any of his goods or chattels, every such trader doing, suffering, procuring, executing, permitting, making, or causing to be made any of the acts, deeds, or matters aforesaid, with intent to defraud or delay his creditors, shall be deemed to have thereby committed an *A. of B.*"—The modifications on this definition by recent legislation are slight, and will be found under **INSOLVENCY**. The expression *A. of B.* is unknown in the phraseology of Scotch law, but the evidences of *notour bankruptcy*, as it is called, are analogous to the English *A. of B.* See **INSOLVENCY**.

**ACT OF GOD** is a legal expression, and signifies any natural or accidental occurrence not caused by human negligence or intervention; such as the consequences arising from storms, lightning, tempests, etc., and which are deemed fatalities and losses such as no party under any circumstances (independently of special contract) is bound to make good to another. It has been ruled in England that the loss must be immediate, and the necessary consequence of the accident.

**ACT OF GRACE** is the name given to an old Scotch act (1693, c. 32) for the maintenance of poor persons imprisoned for debt. It is usually applied in England to insolvent acts, and general pardons, at the beginning of a new reign or on other great occasions.

**ACT OF INDEMNITY** is an annual act of parliament passed for omissions in taking the oaths and assurances required by law of persons admitted to any public office or employment. See **ABJURATION**.

**ACTEA**, a genus of plants of the natural order *rannunculaceae* (q. v.), the type of the sub-order *actiæ*, distinguished by the colored imbricated calix and indehiscent succulent fruit. The genus *actaea* has four deciduous sepals, four petals, and a single baccate carpel.—*A. spicata*, the baneberry or herb christopher, is a native of the n. of Europe, found in bushy places in some parts of England. It is a perennial herbaceous plant, about 1 to 2 ft. high, with ternate leaves, and the leaflets deeply cut and serrated, the flowers in racemes, the berries black and poisonous. The root is anti-spasmodic, expectorant, and astringent, and is sometimes useful in catarrh. *Botrophis actæoides* (*actaea racemosa* of Linnaeus) is a native of the U. S., whose roots are said to possess similar qualities, and are also reputed as a remedy for the bite of the rattlesnake.

**ACTEON**, a mythical personage, a grandson of Cadmus. He was trained as a hunter by Chiron. Having once surprised Diana while bathing in a fountain, he was changed by the offended goddess into a stag, and his own dogs, not knowing him, tore him in pieces. According to Euripides, Diana was jealous because Actæon had boasted that he excelled her in hunting.

**ACTA ERUDITORUM**, the first literary serial in Germany; was begun 1683 by Otto Mencke, professor in Leipsic university, published monthly in Latin, and kept in the founder's family until 1754, when change of management and neglect reduced its circulation and reputation. The last volume, completing the record of science to the close of 1776, appeared in 1782. The whole set is in 117 vols, 4to. There have been many imitations in various countries.

**ACTA SANCTORUM** or **MARTYRUM**, acts of saints or martyrs, the collective title given to several old writings, respecting saints and martyrs, in the Greek and Roman Catholic churches, but now applied especially to one extensive collection begun by the Jesuits in the 17th c., and intended to serve as a better arrangement of the materials found in ancient works. This great undertaking, which was commenced by the Jesuit Heribert Rosweyd of Antwerp, has considerable importance, not only in a religious and ecclesiastical point

of view, but also with regard to history and archaeology. After Rosweyde's death, in 1629, J. Bolland was commissioned by the order of Jesuits to continue the work; and with the assistance of G. Henschen he prepared two volumes, which appeared in 1643. After the death of this editor (1665), the work was carried on by a society of learned Jesuits, who were styled "Bollandists," until 1794, when its further progress was prevented through the invasion of Holland by the French. In recent times, the undertaking has been resumed, and in 1846 the fifty-fourth volume was published at Brussels. Five or six additional volumes have appeared since. The lives are arranged in the order of the calendar. The volumes last published, of which the latest appeared in 1868, are for Oct. A new edition of the first 54 vols appeared in 1863-69. For notices of other and similar collections, see SAINTS, MARTYR, and MARTYROLOGY.

ACTIAN GAMES. See ACTIUM, *ante*.

ACTINIA, a genus of marine animals, belonging to the sub-kingdom *coelenterata* (see SUB KINGDOMS, ANIMAL), and to the class *actinozoa*, of which latter group the genus is thoroughly typical. The animals included in this genus are familiarly known as "sea-anemones." They are found attached by their bases to rocks and stones, and present the appearance of cylindrical fleshy bodies, possessing a mouth surrounded by numerous tentacles in the free extremity. These tentacles in the genus *A.* are of simple, tubular conformation. They are perforated at their tips, and also possess sucker-like disks. The mouth leads into a stomach-sac, which (as in all *coelenterate* animal) communicates freely below with the general body-cavity, and thus comes to resemble a pocket with the bottom cut out. The stomach-sac is kept in its place by a series of vertical radiating plates, named *lamellæ* or *mesenteries*, to the faces of which the reproductive organs are attached. The actiniadæ are capable of slow movements by expanding and contracting the muscular bases of their bodies. They may be cut and divided in various ways, with the result of producing new individuals by *artificial fission*. Some species may attain a great age, as proved by the well-known case of a common *A.* (*A. mesembryanthemum*), which was taken from the frith of Forth by Sir John G. Dalrymple in 1823, and is still (1876) alive, in the possession of Dr. McBain of Trinity, near Edinburgh. This remarkable animal "grannie" by name—has at various times given birth to numerous young; and as more than one of her progeny have in turn become parents, her cognomen is not merely complimentary.

Actinia seen from above. SECTION OF ACTINIA:

a. cavity of stomach, b. surrounding chambers.

ACTINISM, the property of the sun's rays which produces chemical changes. See SPECTRUM.

ACTINOMETER, an instrument to measure the heat of the sun's rays; at first a common thermometer, the bulb blackened with nitrate of silver; then one with a large bulb filled with blue solution of ammonia and sulphate of copper, inclosed in a box with a plate-glass top, the expansion of the liquid to indicate the amount of heat. Prof. John W. Draper of N. Y. next discovered that equal volumes of chlorine and hydrogen form chlor-hydric acid in direct proportion to the actinic intensity of the light and the time of exposure. Subsequently Bunsen and Roscoe hit upon the same plan. There are other actinic reactions; as, in a solution of chloride of gold and oxalic acid, the gold precipitates on exposure to actinic rays.

ACTION, in its large and general sense, means a judicial proceeding before a competent tribunal for the attainment of justice; and in this sense it is applied to procedure, whether *criminal* or *civil*. In its more limited acceptance, it is used to signify proceedings in the *civil* courts, where it means the form prescribed by law for the recovery of a right, or what is one's due. In the law of England, the term *A.* used to be applied to proceedings in the courts of *common law*, as distinguished from those of *equity*, where the word *suit* was used. What, in the courts of queen's bench, common pleas, and exchequer, before the judicature act of 1873, was called action-at-law, was in the courts of equity called a suit in equity. See COMMON LAW, COURTS OF, and EQUITY.

In the Scotch law, which recognizes no distinction in legal administration between law and equity, the word *A.* is defined comprehensively as a demand regularly made and insisted on before the judge competent for the recovery of a right. Accordingly, while in Scotland there is, as in England, a remedy for every wrong, the law recognizes and gives effect to the right of a party to claim and to have *declared* a particular interest or right, even although that interest or right may not be withheld, or called in question. It is sufficient that it is doubtful, and that the ascertainment of it is necessary for the position and purposes of the plaintiff, or *pursuer*, as the Scotch law calls the active party. This procedure is known by the name of an *A. of declarator*, which has been described as a suit in which something is prayed to be decreed in favor of the plaintiff, but nothing sought to be paid, performed, or done by the defendant. Lord Stair, in his

*Institutes of the Law of Scotland*, says, "such actions may be pursued for instructing or clearing any kind of right relating to liberty, dominion, or obligation;" and he further observes, "there is no right but is capable of declarator." Various attempts have been made to introduce this mode of proceeding into the practice of the law in England, but as yet without success. The idea of the declarator has been said to have been derived by the Scotch lawyers from the French legal system, according to whose forms the existing administration of the Scotch law was originally molded. In the institutes of Justinian there are, however, indications of the partial use of this form of A. by the Roman lawyers.

We may add that the word A. is derived from the Latin *actis* (*agere*), and that the plaintiff in a suit or action was originally said to be the *actor*, which, indeed, in the recorded pleadings of the Scotch courts, his counsel or advocate still is called.

**ACTION** (*ante*) in law. No action can be maintained by a citizen against a government without the government's express consent; except in rare special cases no suit can be brought by a citizen against the U. S.; relief must be sought by petition, or in the court of claims. State courts do not ordinarily contest acts of foreign states or sovereigns for anything done or omitted in their public character. Here negotiation takes the place of suit. Modern statutes have much simplified proceedings under this title, and many old forms have been abandoned. In N. Y. an effort has been made to avoid all distinctive forms; there every other than a criminal is a civil action, having no other specific name; the design of the code being to give by this action every kind of relief which can be sought in civil causes.

**ACTIUM** (now *Azio*), a t. and promontory on the w. coast of Greece, at the entrance of the Ambraciot bay, now the gulf of Arta, is memorable for the sea-fight which took place near it, 2d Sept., 31 B.C., between Octavianus (afterwards the emperor Augustus) and Marcus Antonius. These two had for some time ruled the Roman world between them—the former in the w., the latter in the e.; it now came to a struggle for the sole sovereignty. The two armies were encamped on the opposite shores of the gulf: Octavian had 80,000 infantry, 12,600 cavalry, and 230 ships of war; Antony, 100,000 infantry, 12,000 cavalry, and 230 ships. Antony's ships were large and well provided with engines for throwing missiles, but clumsy in their movements; Octavian's were smaller and more agile. Antony was supported by Cleopatra, queen of Egypt, with 63 vessels, who induced him, against the opinion of his most experienced generals, to determine upon a naval engagement. The battle continued for some hours undecided; at last, Agrippa, who commanded Octavian's fleet, succeeded, by a skillful maneuver, in compelling Antony to extend his line of battle, whose compactness had hitherto resisted all attempts of the enemy to break through. Cleopatra, whose ships were stationed behind Antony's line, apprehensive of that line being broken, took to flight with her auxiliary fleet, and Antony recklessly followed her with a few of his ships. The deserted fleet continued to resist bravely for some time, but was finally vanquished; the land-army, after waiting in vain seven days for Antony's return, surrendered to Octavian. As a memorial of the victory that had given him the empire of the world, and out of gratitude to the gods, Octavian enlarged the temple of Apollo at A., dedicated the trophies he had taken, and instituted games to be celebrated every five years. He also built, on the spot where his army had been encamped, the splendid city of Nicopolis (city of victory), near where Prevesa now stands.

**ACT OF PARLIAMENT** is a resolution or law passed by all the three branches of the legislature—the king [or queen], lords, and commons. The expression is generally used to signify the *record* of an A. of P., and such records are strictly synonymous with the term "statutes," or "statutes of the realm." An A. of P. thus made is the highest legal authority acknowledged by the constitution. It binds every subject in the land, and even the sovereign himself, if named therein. And in England it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament. In Scotland, however, a long course of contrary usage or of disuse may have the effect of depriving a statute of its obligation; for, by the Scotch law, a statute may become obsolete by disuse, and cease to be legally binding. It was formerly held in England that the king might in many cases dispense with penal statutes; but by the statute 1 W. and M. st. 2, c. 2, it is declared that the suspending or dispensing with laws by royal authority, without consent of parliament, is illegal.

An A. of P. or statute is either *public* or *private*. A public act regards the whole community, but the operation of a private act is confined to particular persons and private concerns, and some private acts are *local*, as affecting certain places only. As the law till lately stood, the courts of law were bound *ex officio* to take judicial notice, as it is called, of public acts—that is, to recognize these acts as known and published law, without the necessity of their being specially pleaded and proved; but it was otherwise in regard to private acts; so that in order to claim any advantage under a private act, it was necessary to plead it, and set it forth particularly. But now, by the 13 and 14 Vict. c. 21, s. 7, every act made after the then next session of parliament is to be taken to be a public one, and judicially noticed as such, unless the contrary be expressly declared.

Acts of P. are also sometimes described as *declaratory*, or *penal*, or *remedial*, according to the nature of their object or provisions. Declaratory statutes are where the old

custom of the kingdom has almost fallen into disuse, or become disputable, in which case the parliament has thought proper (*in perpetuum rei testimonium*, and for avoiding all doubts and difficulties) to declare what the common law is and ever has been. Penal acts are those which merely impose penalties or punishments for an offense, as in the case of the statutes relative to game. Remedial acts are such as supply some defect in the existing law, and redress some abuse or inconvenience with which it is found to be attended, without introducing any provision of a penal character. There is also a distinction of Acts of P. as being either *enlarging or restraining, enabling or disabling* acts.

An A. of P. begins to operate from the time when it receives the royal assent, unless some other time be fixed for the purpose by the act itself. The rule on this subject, in England, was formerly different; for at common law, every A. of P., which had no provision to the contrary, was considered, as soon as it passed (i.e., received the royal assent), as having been in force, retrospectively, from the first day of the session of parliament in which it passed, though, in fact, it might not have received the royal assent, or even been introduced into parliament, until long after that day; and this strange principle was rigidly observed for centuries. The ancient acts of the Scotch parliament were proclaimed in all the county towns, burghs, and even in the baron courts. This mode of promulgation was, however, gradually dropped as the use of printing became common; and in 1581 an act was passed declaring publication at the market cross of Edinburgh to be sufficient. British statutes require no formal promulgation; and in order to fix the time from which they shall become binding, it was enacted by the 23 Geo. III. c. 13, that every A. of P. to be passed after 8th April, 1793, shall commence from the date of the indorsement by the clerk of parliament, stating the day, month, and year when the act was passed and received the royal assent, unless the commencement shall, in the act itself, be otherwise provided for.

An A. of P. consists of various parts—such as the title, the preamble, the enacting sections and clauses, and sometimes certain forms or schedules added by way of appendix—and it is referred to by the year of the sovereign's reign, and the chapter of the statutes for that year. The old acts of the Scotch parliament, before the union with England, are cited by the year in which they were passed, and the order of the number of chapter. See STATUTES, SCOTCH STATUTES, and PARLIAMENT.

**ACT OF SETTLEMENT**, a name given to the statute 12 and 13 Will. III. c. 2, by which the crown was limited to the family of her present majesty, queen Victoria. It was towards the end of king William III.'s reign, when all hopes of other issue died with the duke of Gloucester, that, as we are told by Blackstone, the king and parliament thought it necessary again to exert their power of limiting and appointing the succession, in order to prevent another vacancy of the throne, which must have ensued upon their deaths, as no further provision was made at the revolution than for the issue of queen Mary, queen Anne, and king William. The parliament had previously, by the statute of 1 W. and M. st. 2, c. 2, enacted, that every person who should be reconciled to or hold communion with the see of Rome, should profess the Roman Catholic religion, or should marry a Roman Catholic, should be excluded from succession to, and be forever incapable to inherit, possess, or enjoy the crown; and that in such case the people should be absolved from their allegiance, and the crown should descend to such persons, being Protestants, as would have inherited the same, if the person so reconciled, holding communion, professing or marrying, were naturally dead. To act, therefore, consistently with themselves, and, at the same time, pay as much regard to the old hereditary line as their former resolutions would admit, they turned their eyes on the princess Sophia, electress and duchess-dowager of Hanover; for upon the impending extinction of the Protestant posterity of Charles I., the old law of regal descent directed them to recur to the descendants of James I.; and the princess Sophia, being the youngest daughter of Elizabeth, queen of Bohemia, who was the daughter of James I., was the nearest of the ancient blood-royal who was not incapacitated by professing the Roman Catholic religion. On her, therefore, and the heirs of her body, being Protestants, the remainder of the crown expectant on the death of king William and queen Anne without issue, was settled by statute 12 and 13 Will. III. c. 2. And at the same time it was enacted that whosoever should thereafter come to the possession of the crown, should join in the communion of the church of England as by law established.

This is the last limitation of the crown that has been made by parliament: and the several actual limitations, from the time of Henry IV. to the present, clearly prove the power of the king and parliament to remodel or alter the succession. It is even made highly penal to dispute such power, for by the statute 6 Anne, c. 7, it is enacted, that if any person maliciously, advisedly, and directly shall maintain, by writing or printing, that the kings of this realm, with the authority of parliament, are not able to make laws to bind the crown and the descent thereof, he shall be guilty of high treason; or if he maintains the same by only preaching or advised speaking, he shall incur the penalties of *premunire*.

The Princess Sophia dying before queen Anne, the inheritance, thus limited, descended on her son and heir, king George I.; and having, on the death of the queen, taken effect in his person, from him it descended to king George II., from him to his grandson and heir, king George III.; from him to his son George IV., who was succeeded

by his brother, William IV.; and from the monarch last mentioned the crown descended to his heiress, the daughter of his brother Edward, duke of Kent, our present gracious sovereign queen Victoria.

"Hence," Blackstone remarks, "it is easy to collect that the title to the crown is at present hereditary, though not quite so absolutely hereditary as formerly; and the common stock or ancestor from whom the descent must be derived is also different. Formerly, the common stock was king Egbert, afterwards William the conqueror, and now it is princess Sophia, in whom the inheritance was vested by the new king and parliament. Formerly, the descent was absolute, and the crown went to the next heir without any restriction; but now, upon the new settlement, the inheritance is conditional; being limited to such heirs only of the body of the princess Sophia as are Protestants, members of the church of England, and are married to none but Protestants."

**ACT OF TOLERATION** is the name commonly given to the act of parliament 1 W. and M., st. 1, c. 18, confirmed by 10 Anne, c. 2, by which all persons dissenting from the church of England (except Roman Catholics and persons denying the Trinity) were relieved from such of the acts against nonconformists as prevented their assembling for religious worship according to their own forms, or otherwise restrained their religious liberty, on condition of their taking the oaths of allegiance and supremacy, and subscribing a declaration against transubstantiation; and in the case of dissenting ministers, subscribing also to certain of the thirty-nine articles. The clause of this act which excepted persons denying the Trinity from the benefits of its enactments, was repealed by 53 Geo. III. c. 160.

The Protestant dissenters, however, still remained, notwithstanding these provisions, subject to the obligation imposed by the test and corporation acts (q.v.), on all those who were admitted to any office, of taking the sacrament of the Lord's supper according to the rites of the church of England; but this disability was at length removed by the 9 Geo. IV. c. 17. And to this list of concessions we are now to add the act of 15 and 16 Vict. c. 36, allowing the dissenters to certify their places of worship to, and register them with, the registrar-general of births, deaths, and marriages, instead of the archbishop, bishop, or court of quarter sessions.

These various A. of T. operated, however, to the exclusive benefit of *Protestant* dissenters, and afforded no relief to Roman Catholics. With respect to the latter, the progress of emancipation was slower and more reluctant. By statutes, however, of 18 Geo. III. c. 60, 31 Geo. III. c. 32, and 43 Geo. III. c. 50, most of the severer penalties and disabilities to which they were formerly subject were removed; and by 10 Geo. IV. c. 7, commonly called the Catholic emancipation act, Roman Catholics were restored in general to the full enjoyments of all civil rights, being only excluded from holding ecclesiastical offices, and certain high appointments in the state. By another act of the 2 and 3 Will. IV. c. 115, it was provided that Roman Catholics should be subject in this particular to the same laws as were applicable to Protestant dissenters; the effect of which provision is to empower them to acquire and hold property for such purposes. And now, by the acts of 7 and 8 Vict. c. 132, 9 and 10 Vict. c. 59, and 21 and 22 Vict. c. 48, Roman Catholics and Jews are relieved from all enactments calculated to oppress them, and are thus practically admitted to all the privileges of the constitution.

In Scotland, toleration in religious matters is secured by various old Scotch statutes passed before the union with England, particularly by the act 1690, c. 27; and this was followed up after the union by the British statute 10 Anne, c. 7, s. 5, which declares that "it shall be free and lawful for all the subjects in that part of Great Britain called Scotland to assemble and meet together for divine service without any disturbance; and to settle their congregations in what forms or places they shall think fit to choose, except parish churches;" an enactment which amounts to a legal recognition of dissenters, if indeed it may not be called their charter in Scotland.

**ACT OF UNIFORMITY** is the name by which the statute 13 and 14 Car. II. c. 4, is usually described. By that statute it was enacted that the book of common prayer, as then recently revised, should be used in every parish church and other place of public worship in England, and that every school-master and person instructing youth should subscribe a declaration of conformity to the liturgy, and also to the effect of the oath and declaration mentioned in the act of 13 Car. II. st. 2, c. 1. It further enacted that no person should thenceforth be capable of holding any ecclesiastical promotion or dignity, or of consecrating or administering the sacrament, till he should be ordained priest according to episcopal ordination, and with respect to all ministers who then enjoyed any ecclesiastical benefice, it directed that they should, within a certain period, openly read morning and evening service, according to the book of common prayer, and declare before the congregation their unfeigned assent and consent to the use of all things therein contained, upon pain of being *ipso facto* deprived of their spiritual promotions. By this statute, two thousand of the clergy, who refused to comply with its provisions, were deprived of their preferments. This statute also contained a regulation that no school-master in a private house should instruct youth without having obtained a license from the ordinary; but this regulation was repealed by 9 and 10 Vict. c. 59.

**ACTON**, Sir JOHN FRANCIS EDWARD, 1786-1811. He was a native of Besançon, son of Edward Acton, a physician. He served in the French and Tuscan navies, command-

ing a frigate in the expedition against Algiers in 1774. For gallantry in rescuing some thousands of Spanish soldiers from slavery he was promoted, becoming commander-in-chief of the Neapolitan sea and land forces; next, minister of finance, and finally prime minister. When the French entered Naples in 1806 he fled to Sicily, where he died. His second son, Charles Jannarius Edward, was made cardinal Santa Maria Della Pace in 1842. (See *ante* for ACTON, JOSEPH, PRINCE; where is intended the same person as the commander-in-chief here mentioned. There is doubt about his responsibility for the ill treatment of political prisoners.)

**ACTON, JOSEPH, PRINCE**, prime minister of Ferdinand IV. of Naples, was the son of an Irish physician, and was born at Besançon in 1737. After acquiring distinction in the naval service of France and Tuscany, he gained a position in the Neapolitan government, and became the favorite of queen Caroline. His measures, prompted by his extreme hatred of France, were cruel and intolerant, and ultimately caused a reaction against the royal family of Naples, and in favor of the French party and the Carbonari. When left unaided by English influence, A. lost the power he had so often abused, and died in 1811, deservedly condemned by all parties.

**ACTON BURNELL**, a statute of Edward I., so called because passed when parliament was sitting at a Shropshire village of the name, Oct. 12, 1283. It was the first law to enable merchants to collect debts by seizure of property and imprisonment. Jews were excluded from its benefits, it being designed to encourage foreign Christian merchants to settle in England. A similar law was passed in France 253 years later.

**ACTS, TEST AND CORPORATION.** See article TEST ACTS.

**ACTS OF SEDE BUNT** are ordinances of the court of session or supreme civil court in Scotland, made originally under authority of the Scotch act 1540, c. 93, whereby the judges are empowered to make such rules or ordinances as may be necessary for the regulation of legal procedure and the expediting of justice. The power thus conferred was exceeded, and it became necessary to ratify several of the A. of S. in the Scotch parliament. In so far, however, as A. of S. are confined to declarations of the purposes of the court to decide in a particular way, on an occurrence of similar circumstances, they seem to amount to little more than authoritative announcements of the intention of the court to adhere judicially to certain precedents; and for upwards of a century and a half they have been almost exclusively confined to the regulation of judicial procedure, and to matters therewith connected. In several recent statutes, express power is given to the court of session to pass A. of S., for carrying the purpose of the legislature into more complete effect; and it is usually provided that the A. of S. made in virtue of such power shall be laid before parliament within a limited time. The old quorum of nine judges is requisite in passing an A. of S., 48 Geo. III. c. 151, s. 11.

**ACTS OF THE APOSTLES**, the fifth book of the New Testament, the authorship of which is ascribed by tradition, and with the highest probability, to the evangelist Luke. Beginning with the ascension of Christ, it gives an account of the spread of the Christian church; confined, however, chiefly to the part taken therein by the apostle Paul. Notwithstanding its title, little is said of the other apostles, with the exception of Peter. The narrative closes with the year 62 A.D., Paul being then a prisoner at Rome. The book has always been received as canonical, except by a few Manichean heretics; but its historical character has been impugned by the Tübingen school. Spurious acts were put in circulation by early Christian sects.

**ACTS OF THE APOSTLES** (*ante*), the name, generally, and, from a very early period, given to the fifth book of the New Testament, which is often quoted by the early Christian writers, and always as the work of Luke the evangelist. The introduction to it connects it with the third gospel as written by the same author and addressed to the same person. That both were from the same hand is also to be inferred from the similarity of style, idiom, and diction. In modern times some writers have attempted a criticism invalidating both the external testimony on this point and the internal probabilities and proofs. A single specimen may be given of the reasoning on which they rely for dislodging this book from its place in scripture, or at least for lowering the estimation in which it is held. "According to the gospel ascribed to Luke, all the events related of Jesus after the resurrection took place, or seem to have taken place, on the day of the resurrection, or they may possibly have extended into the next morning, but certainly not later. The A. on the contrary states that Jesus was seen by the disciples for forty days after the resurrection." This is a summary way of developing a contradiction where none exists. The account of these events in Luke's gospel is indeed brief and condensed, but it does not assert or imply that they all took place at once. Points in the narrative fairly admit, and rationally require, the supposition of intervals of time. The other gospels, also, declare or imply such intervals. The accounts of Matthew and Mark are more condensed than even Luke's. John's is much more extended. It marks off expressly several intervals, and says that one of them was a week long. All these accounts, therefore, taken together, prepare the way for the statement in the A. that the whole time between the resurrection and the ascension amounted to 40 days. The Greek title, it will be observed, does not indicate that the book contains a complete history of the apostles of Christ in their work of proclaiming the gospel. It is not "the

acts" (which indeed the English translation does make it), as if all were intended, but "acts" as only a part. This is in strict accordance with the contents. In the opening of the book, the names of the eleven apostles and of the twelfth (chosen to fill the place of Judas) having been given, the actions and words of Peter at once become prominent; then Peter and John are mentioned together, and soon Peter's course only is given. After 12 chapters, of which the larger part of one relates to Paul's conversion, the rest of the book is filled chiefly with this last apostle's work and things connected with it. Jerusalem, the church, and the apostles there, scarcely appear except as connected with Paul.

The contents of the book may be noted as follows:

I. *An exhibition of the ever-present, controlling, and administrative agency of the Lord Jesus*, from his exalted sphere at the right hand of God, putting forth the powers of his risen life and giving organization to his spiritual and everlasting kingdom. We have his commands to the apostles, his direction of the choice of Judas's successor, his sending down the holy spirit, his turning men from their sins and adding them to his church, his working of miracles by the instrumentality of the apostles, his sending Peter to open the door of faith to the Gentiles and Philip to guide the Ethiopian in his effort to understand the scripture, his delivering Peter from prison and Paul from his mad career.

II. *A record of the gift and operations of the Holy Spirit*. The Savior at the close of his work on earth promised that he would send from the Father the spirit of truth to abide with his disciples, to reveal the truth to them and to convince the world of sin, righteousness, and judgment. The A. records the fulfillment of the promise and exhibits the work of the holy spirit in the minds and hearts of men of various nations. It thus becomes the connecting link between the gospels and the epistles which describe the spirit's progressive work.

III. *The account of the planting and spread of the Christian church*. It records the names of the apostles, the number of the original company at Jerusalem, and the beginning of the church there. It shows that the life of Jesus was appealed to among those who had witnessed it; that his Messiahship was defended in the hearing of those who had crucified him for asserting it; that the divine appointment of his death was proclaimed in the midst of those who had inflicted it as a malefactor's doom; that his resurrection was affirmed in the face of those who had buried him and exercised official guardianship over his grave; that the first adherents to his religion were gained among the crucifiers themselves, including priests as well as the people; that the faith in him spread immediately among Jews and proselytes, then in Jerusalem, who belonged to the chief countries of the Roman empire, and to some beyond its bounds; and that, the Gentiles being speedily admitted by divine command to the full blessings of salvation, the church was rapidly extended into Judea, Samaria, Phenice, Cyprus, Syria, Asia Minor, Illyria, and Italy.

IV. *Conclusive evidence of the divine origin of Christianity*. It shows that, advancing from a very small beginning, by the instrumentality of unarmed men, opposed by the power of the Roman empire; of private persons, opposed by the authority of the Jewish and pagan priesthoods; of unlettered men, opposed by all the culture of the times, it prevailed over the mightiest institutions, the most formidable barriers, the most malignant persecutions, and prevailed by the power of God. When the historian Gibbon was investigating the decline and fall of the Roman empire he found that "an inquiry into the progress and establishment of Christianity constituted an essential part of the history of the Roman empire." "While that great body," he says, "was invaded by open violence or undermined by slow decay, a pure and humble religion gently insinuated itself into the minds of men, grew up in silence and obscurity, derived new vigor from opposition, and finally erected the triumphant banner of the cross on the ruins of the capitol." His curiosity having been awakened "to inquire by what means the Christian faith obtained so remarkable a victory over the established religions of the earth," he ventures to give what he calls five secondary causes of the rapid growth of the Christian church. All these are *real portions of Christianity*, and, as stated by him, they are seen to amount to this, that it was the prevalence of Christianity that promoted the triumph of Christianity, as a great conflagration is promoted by the spreading of the flames. The book of A. supplies the necessary beginning to Gibbon's account by showing how the fire was kindled, how the essential elements of Christianity were produced. His causes are: 1. "*The zeal of the Christians*;" and the A. informs us how the Christians came into existence and how their zeal was first produced and then "purified." 2. "*The doctrine of a future life*;" and the A. declares the source whence the doctrine was obtained and "improved." 3. "*The miraculous powers ascribed to the primitive church*;" and the A. explains how the primitive church began, and on what evidence the miraculous powers were so ascribed to it as to secure its triumph. 4. "*The pure and austere morals of the Christians*;" and the A. reveals how their morals came to be pure and austere, in the midst of an abounding corruption too horrible to be looked upon, and nowhere more fully revealed than in Gibbon's own work. 5. "*The union and discipline of the Christian republic*;" and the A. demonstrates how the church came to be "*a republic in the midst of the empire*," in what its "union" consisted, how its "discipline" was maintained, and by what power "it became an independent and increasing state."

V. *The close of Scripture history in relation to the Jews.* In the great interest awakened by the book as recording the first preaching to the Gentiles, comparatively little notice is taken of the fact that it records also the last preaching to the Jews. The book opens with the preaching of the gospel to the Jews, the acceptance of it by some of them, and the bitter opposition made to it by the rest which at length drove away a large part of the Christians from Jerusalem and in a great degree brought the preaching to the Jews there to an end. When Paul came there after his conversion he began to preach zealously to the Jews, but they would not receive his word, and he was commanded by the Lord to leave the city. At Antioch, in Pisidia, he preached earnestly to Jews and Gentiles, but when the former contradicted and blasphemed he turned, by divine command, to the latter. A similar result was witnessed in Iconium, Lystra, Thessalonica, Berea, Corinth, and Ephesus. When, late in life, he went again to Jerusalem, as it proved for the last time, the opposition of the Jews was more furious than before, and after a narrow escape from death at their hands and an imprisonment, continuing more than two years, through their instrumentality, he was constrained to appeal unto Caesar. Three days after his arrival at Rome he sent for the resident Jews, and had a day appointed for making known the gospel to them, on which, from morning to evening, he expounded, testified, and persuaded concerning Jesus out of the law and the prophets. The result then was that some believed and others believed not; and again Paul turned to the Gentiles. With this narrative the A. ends, abruptly, as many say, with respect to Paul and the gospel, but appropriately with respect to the Jews. If no reason can be shown why Christian history should here be cut short, certainly it was necessary that Jewish history should here come to an end. For, in a little while after Paul's imprisonment at Rome, Jerusalem was destroyed and the Jews were scattered abroad. And thus the A. completes the unity of the historical books of scripture whose constant and ultimate, though not always direct, reference is to the Jews.

ACTS, SPURIOUS OR APOCRYPHAL, treatises or sentences purporting to have been written by or concerning Christ, the apostles and other disciples. Many of these are now known only through the statements of ancient authors. Others are extant. I. One class profess to be words of Christ, and are supposed by some writers to have been derived from early accounts concerning him, of which many had been written before the gospel of Luke (i. 1). Some of them, in all probability, were merely inaccurate quotations from the genuine gospels; others have no external testimony to establish their genuineness and no merit to make them worthy of regard. The beautiful words, not recorded in the gospels, which Paul quoted to the Ephesians as words of Christ, "It is more blessed to give than to receive," are not properly included in the class now described, for they are vouched for as genuine words of Christ, by an inspired apostle who had many ways of learning the truth about them, and have always had a place in an undisputed book of the New Testament. II. Many spurious treatises called *Acts of the Apostles* were written at now unknown dates. Of some of these little more is known than that they once existed; of others fragments remain, and several are extant entire. A selection was printed at London in 1821 under the title, *Apocryphal New Testament*. They abound in fabulous, puerile, and visionary statements which are unworthy of notice. III. Among the treatises of this general class, the A. of Pilate deserves to be singled out as probably genuine and valuable. It is well known that accounts of all important events that occurred at Rome were carefully preserved either in the *Acts of the Senate* or the *Daily Acts of the People*. In like manner it was the duty of the governors of provinces to send to the senate or the emperor reports of their administration, including accounts of the remarkable transactions that occurred in their region. These were called the "acts" of their government, and were not published for general perusal, but deposited among the archives of the empire, as are state papers now, for information to historians. There is every reason to believe that Pilate sent such a report of his administration to Rome, and that it included an account of Jesus who was called Christ. And it is certain that the primitive Christians, in defending their faith, appealed to these A. of Pilate as to testimony which could not be denied. Justin Martyr, in his first defense of the Christians, presented, 140 A.D., to the emperor and senate, having mentioned the crucifixion of Jesus and some of the events connected with it, says: "That these things were so done, you may know from the acts made in the time of Pontius Pilate." And again, having recounted some of the miracles of Jesus, such as healing diseases and raising the dead, he adds: "And that these things were done by him you may know from the acts made in the time of Pontius Pilate." Tertullian, also, in his defense of Christianity, 200 A.D., says: "Of all these things relating to Christ, Pilate himself sent an account to Tiberius, then emperor."

ACTUARY. The *actuarii*, in ancient Rome, were clerks who recorded the *acta* of the senate and other public bodies. The term might therefore, so far as its etymology is concerned, be applied to men of business in general. But in the constantly increasing tendency to subdivide labor and specialize functions, there has arisen, in recent times, a distinct branch of business, embracing all monetary questions that involve a consideration of the separate or combined effect of interest and probability, especially as connected with the duration of human life; and it is to one who devotes himself to this department of business that the name of A. has been specially assigned. The investigations and calcu-

lations of the A. supply the principles of operation for the numerous institutions now engaged in the transaction of life-assurance, annuity, and reversionary business. His functions might be briefly defined as *the application of the doctrine of probabilities to the affairs of life*. There are two societies of actuaries in this country: "The Institute of Actuaries of Great Britain and Ireland," established in 1848; and the "Faculty of Actuaries in Scotland," established 1856.

ACULEUS, in botany. See PRICKLE.

**ACUPRESSURE**, a mode of arresting hemorrhage from cut arteries. It is based on the principle of temporary metallic compression, and was first suggested to the scientific world by Sir James Y. Simpson, bart., in a paper read before the royal society of Edinburgh, Dec., 1859. The simplest mode of practicing it may be thus described: The needle is passed through the flaps or sides of the wound, so as to cross over and compress the orifice of the bleeding artery, just as in putting a flower in the lapel of one's coat, one crosses over and compresses the flower-stalk with a pin pushed twice through the lapel. The middle portion of the needle—the only part of it which is in immediate contact with the fresh surface of the wound—bridges over and compresses the artery at its bleeding orifice, or perhaps a line or two more on its cardiac side. The head and point of the needle are exposed externally on the cutaneous surface of the flap or side of the wound. "When passing the needle in this method," says Sir J. Y. Simpson, "the surgeon usually places the point of his left forefinger or of his thumb upon the mouth of the bleeding vessel, and with his right hand introduces the needle from the cutaneous surface, and passes it right through the whole thickness of the flap till its point projects for a couple of lines or so from the surface of the wound, a little to the right side of the tube of the vessel. Then, by forcibly inclining the head of the needle towards his right, he brings the projecting portion of its point firmly down upon the site of the vessel; and after seeing that it thus quite shuts the artery, he makes it re-enter the flap as near as possible to the left side of the vessel, and pushes on the needle till its point comes out again at the cutaneous surface. In this mode, we use the cutaneous walls and component substance of the flap as a resisting medium, against which we compress and close the arterial tube. But in some wounds, a neighboring bone or other firm unyielding texture forms the best and readiest point of resistance against which to pin and compress the artery by the acupressure needle."

This is the first and simplest mode of applying A. Six other methods, however, have been suggested; and as each of them has its peculiar appropriateness as a hæmostatic agent, it will be proper to enumerate and describe them. The appliances which these other methods require are—a pin with a glass head, to admit of sufficient pressure for introduction; a needle threaded with iron wire; and a loop of inelastic iron wire, 5 or 6 in. in length. The pins and needles should be of various sizes, and they should also be bayonet-pointed; the latter form being superior to the spear-pointed, as facilitating introduction, and as being less apt to cut the tissues.

Second mode: The needle is inserted in the fresh surface at a little distance from the vessel; it is pushed on, causing its point to rise up as near the artery as possible; it then bridges over and compresses the artery; then its point is made to dip into the raw surface of the wound on the other side of the vessel; finally, it is forced on until it emerges a second time on the wound. The passive or elastic iron wire with which it is threaded enables it to be easily withdrawn. Third mode: The needle is entered on one side of the artery; is pushed behind so that its point emerges on the opposite side of the vessel; a loop of inelastic wire is then passed over its point, so as to bring the wire over the track of the artery and behind the stem of the eye-end of the needle; finally, the wire is drawn sufficiently to close the vessel, and is fixed by a twist or half a twist round the needle. The needle may again be withdrawn by the wire which threads it. Fourth mode: This differs from the third only in substituting a long pin with a glass head for the A. needle threaded with iron wire. The pin is preferred to the wire-threaded needle, as avoiding entanglement with the wire, and consequent pain in withdrawing the needle. Fifth mode: This, which, from its inventor, Dr. Knowles, formerly house-surgeon of the Aberdeen hospital, is also called the Aberdeen mode, has two varieties, which differ from each other only in the extent of the rotation given to the instrument by which the twist is effected. In the former variety, the instrument undergoes a half; in the latter, it undergoes a quarter, rotation of a circle. In either case, a threaded needle only, or a long pin only, is required. In the former, the instrument is inserted some lines to one side of the bleeding artery, and passed behind it; its point is then made to emerge on the surface of the wound and a few lines on the other side of the vessel. Then the needle (or pin) is twisted half a rotation, so as to bring its head to the side where its point was before making the twist—the instrument being now above instead of below the artery, and pressed well down upon it. Finally, the point of the instrument is pushed into the tissues beyond the artery, so as to secure it in the proper position, and retain the twist. The latter (and preferable) variety requires only a quarter-rotation to be given to the acupressing instrument. First, the needle (or pin) is entered on one side of the bleeding artery; then pressed onward a few lines in the same direction as the length of the vessel, so that its point emerges on the surface of the wound. Secondly, a quarter-rotation is given to it, so as to place it above the artery; and it is well pressed down against the

small portion of tissues between the instrument and the vessel. Thirdly, the instrument is secured and the twist retained by sending the point into the tissues beyond the artery. Sixth mode: This was devised by Dr. Keith of Aberdeen, and requires a long pin with a duplicature of passive iron wire. The point of the pin is inserted a few lines from the artery; passed below or by the side of it; and afterwards pushed on so as to make the point emerge a few lines beyond the bleeding mouth. The duplicature of iron wire is then thrown over the point of the pin; then the two ends are crossed behind the stem of the pin, so as to take the bleeding mouth between them. The ends of the wire are then pulled tightly enough to stop the hemorrhage; then brought forward by the sides of the pin (one on each side), and finally fixed by a half-twist in front of the pin, and close down upon it. Seventh mode: In this, a long needle is passed through the cutaneous surface pretty deep into the soft tissues, at some distance from the vessel to be compressed; then it is made to emerge near the vessel; then it bridges over and compresses the artery; then it is dipped into the soft parts on the opposite side of the vessel; and finally, its point is brought out a second time through the common integument.

The advantages of A. as a hæmostatic agent (though not universally recognized, and indeed strongly denied by some practitioners) have seemed to many eminent surgeons to be these: first, it is not only the easiest of application, but it is the quickest mode yet devised for arresting hemorrhage; second, this abridgment of the time required for arresting hemorrhage lessens the risk of suppuration, and other effects of the higher grades of inflammation in the stump; third, it causes no condition which must be followed by suppuration, whereas the use of the ligature has never been known to obtain immediate union, or union by primary adhesion, without the formation of pus; fourth, it has never been followed by pyæmia—a constant and distressing result in the case of the ligature; fifth, the presence of a foreign body in the wound—always a source of irritation—is of much shorter duration in the case of the needle than of the ligature, while the former does not divide and strangle the arterial coats, like the latter; sixth, the patient on whom A. has been practiced is comforted by the assurance that in a very few hours after the operation all foreign matter will be removed from the wound—a consolation which he never enjoyed with the ligature.—*Proceedings of the Royal Society of Edinburgh*, vol. iv. p. 249; *Edinburgh Medical Journal*, Jan., 1860; *Medical Times and Gazette*, Feb. 11, 1860; *Acupressure*, 1 vol. 8vo, by Sir J. Y. Simpson, 1865; and *A Practical Treatise on Acupressure*, by Mr. Pirrie and Dr. Keith, 1867. [Few surgeons now use A.]

**ACUPUNCTURE** (Lat., puncturing or pricking with a needle [*acus*]) is a very ancient remedy, and one practiced extensively in the east, for the cure of headaches, lethargies, etc. In Europe it is principally employed to relieve neuralgic pains, and those of chronic rheumatism. Steel needles are made use of, about 3 in. long, and set in handles. The surgeon, by a rotatory movement, passes one or more to the desired depth in the tissues, and leaves them there from a few minutes to an hour. Their insertion is accompanied by no pain, except the first prick—a fact the quacks of the 16th c. did not fail to take advantage of. According to Jerome Cardan, they traveled from place to place practicing A., and before inserting the needle, they rubbed it with a peculiar kind of magnet, either believing, or pretending, that this made the operation painless. The relief to pain afforded by this simple operation is sometimes astonishing, and the wounds are so minute as to be perfectly harmless.—The needles are sometimes used as conductors of the galvanic current to deep-seated parts, and are sometimes made hollow—on the suggestion of Dr. Alexander Wood of Edinburgh—to allow of a small quantity of some sedative solution being injected into the tissues, by which even the terrible pain of tic-douloureux may be almost immediately relieved. See NEURALGIA.

**ADA**, a co. in s.w. Idaho, on Snake river, near the Oregon border; organized in 1864; 2800 sq.m.; pop. '70, 2675. Mining is the principal business. Co. seat, Boise city, which is the capital of the territory.

**ADA**, a t. of the Austrian empire, in Hungary, 8 m. s. of Zenta. Pop., '69, 9344.

**ADAFU'DIA**, a t. of the Felattah country, w. Africa, about 400 m. s.e. from Timbuctoo, in about 13° 6' n. lat., and 1° 3' e. long. It is situated in a dry, healthy, and fertile plain, and is surrounded by a mud wall. Pop. supposed to be about 24,000. A large trade is carried on, and slaves form a principal part of the merchandise.

**ADAGIO**, a slow movement or measure of time in music, between *largo*, *grave*, and *andante*. In our more extended compositions of instrumental or chamber music, the second or third movement is generally marked *adagio*, and serves as a contrast with the rapid and energetic movement of the preceding and following parts of the sonata or symphony. The A. must be written in a measure of time which will afford scope for a flowing and expressive slow melody with a gracefully varied accompaniment. Without contrasted movement and a lively variety in the accompaniment, the slow air would have a monotonous or dull effect. A clear and expressive execution of the A. is a sure test of ability and good taste in the player or singer, as it demands a pure and beautiful intonation, a true reading and phrasing of the cantilena, even in its most minute details, and a careful attention to all points of effect. The finest specimens of the A. are found in the works of the old masters. Haydn, Mozart, and Beethoven, and are as distinct in their features as

were the composers in their personal characteristics. In recent works, our composers have generally succeeded better in their rapid movements than in the A.

ADAIR, a co. in s.w. Iowa, on the head streams of Nodaway river; 576 sq.m.; pop. '80, 11,350. The surface is mostly level; the chief productions are agricultural. Co. seat, Fontanelle.

ADAIR, a co. in s. Kentucky; 450 sq.m.; pop. '70, 11,065—1836 colored. The surface is hilly, with good timber and fertile soil; there is plenty of water power, with several factories; chief products, corn and tobacco. Co. seat, Columbia.

ADAIR, a co. in n.e. Missouri, on Chariton river; 570 sq.m.; pop. '80, 15,176—143 colored. The chief products are corn and tobacco. Co. seat, Kirksville.

ADAIR, Sir ROBERT, 1763-1855; b. in London; son of a surgeon-gen. to George III. and a relative of Charles James Fox. He entered parliament in 1802 as a whig; in 1806 Fox sent him to Vienna, and in 1808 Canning sent him on a special mission to Turkey, where he concluded the treaty of the Dardanelles. He remained English representative in Turkey until 1811. In 1831 he was sent to the new kingdom of Belgium, and was prominent in later peace negotiations. In 1835 he retired with the rank of privy councillor. At the age of 82 he wrote memoirs of his residence at Vienna and elsewhere abroad.

ADAL and ADEL. The name Adal is applied by geographers to the flat country lying between Abyssinia and the Red sea, from Massowa, in n. lat. 15° 40', to the bay of Tadjura, lat. 11° 30'. Adel would seem to designate the coast-country from Tadjura to cape Guardafui, part of which is known as the country of the Somaali.

AD'ALBERT, a French bishop and missionary to the German heathen, about the middle of the 8th c. St. Boniface charged him with heresy in giving his own hair and nails as relics, and he was condemned to execution, but died in prison. His few disciples were called Adalbertines.

AD'ALBERT, SAINT, d. 997, "the apostle of the Prussians." He was educated at Magdeburg; in 983 chosen bishop of Prague; failing to convert the Bohemians, he retired to a monastery near Rome; went back in 993, but again retired in discouragement; in 995 he baptized the future St. Stephen, the first king of the Hungarians; at last went as a missionary to Poland and Prussia, and was murdered by the natives.

AD'ALBERT, d. 1072. He was made archbishop of Bremen in 1043 by Henry III., whom he accompanied to Rome, where he became a candidate for the papacy, barely missing the election. Leo X. made him his legate in the north. During the minority of Henry IV., A. and archbishop Hanna of Cologne usurped the administration of the empire, but he became obnoxious to the princes, and they succeeded in separating him from the emperor; however, he soon after regained his influence and kept it as long as he lived.

AD'ALBERT, HEINRICH WILHELM, 1811-73; b. Berlin; prince, and cousin of the emperor of Germany. He went into the artillery service in the army of Prussia when young, but having a taste for travel he visited most of the countries of Europe, and crossed the ocean to Brazil. In 1848 he was charged with organizing the German navy, and made admiral. In 1856 he made a voyage in the Mediterranean, and was slightly wounded in a fight with pirates off Morocco. He became commander of the marine of Prussia, and when the German empire was established was continued inspector-gen. of the new marine. He was under medium height and in no way conspicuous, unless for carelessness in dress; but he was sharp withal, and jovial. In 1850 he made amorganatic marriage with baroness von Barmin (Thérèse, the dancer, and sister of Fanny Ellsler). They had a son, who died young.

ADA'LIA, anciently *Attalia*, the chief sea-port on the s. coast of Asia Minor, in n. lat. 36° 52', e. long. 30° 45'. The streets rise like the seats of a theater, up the slope of the hill behind the harbor. Pop. 13,000.

ADAM (of Bremen), an old historical writer, whose work entitled *Gesta Hammenburgensis Ecclesie Pontificum* gives a history of the archbishopric of Hamburg from 788 A.D. to the death of the archbishop Adalbert in 1072. This work has great historical value; in addition to its notices of ecclesiastical affairs, it gives accounts of the northern Slavonic tribes, which the author collected during a visit to the Danish king Svend-Estrithson. A. was canon and *magister scholarum* at Bremen from 1067 to the time of his death, which took place in 1076.

ADAM, ADOLPHE CHARLES, 1803-56; b. Paris; composer. In 1817 he entered the conservatory, and studied composition under Boieldieu; began writing piano fantasies and variations; wrote the opera of "Pierre et Catherine" in 1829, and a ballet for London in 1832; is best known by his "Postillon de Lonjumeau," written in 1836. In 1857 he published his autobiography and souvenirs of a musician.

ADAM, ALBRECHT, 1786-1862; d. Munich. He studied painting in Nuremberg; served in the Austrian campaigns against Napoleon, but subsequently served with Beaumarchais, and painted the battle-scene of Labau. He accompanied Eugène in the campaign of 1812 as far as Moscow, and prepared drawings to illustrate Eugène's military career; painted

several large war pictures—his last being the “Battle of the Moskva,” for king Louis of Bavaria.

**ADAM, ALEXANDER, LL.D.**, an eminent scholar and teacher, was born in the parish of Rafford, near Forres, in 1741. His father was a small farmer, with limited means and a numerous family, so that young Adam had to struggle through much hardship in the pursuit of the learning for which he thirsted. While studying at the university of Edinburgh, he had to support himself by giving private lessons, for which he was paid at the rate of one guinea a quarter. He breakfasted and supped on porridge and small-beer; a penny loaf served him for dinner. Such was the stern initiation—not, indeed, a singular case in Scotland—of the brave young scholar. His patient merits, however, soon gained recognition. A.'s first public office was that of classical master in Watson's hospital, Edinburgh; and not long after (1761) he succeeded to the head-mastership of the institution. In 1768 he was appointed rector of the high school; and this situation he filled for nearly forty years with distinguished ability and success, giving himself to its duties with singular devotion, and raising the reputation of the school beyond what it had ever been before. In some of his efforts to that end he encountered such opposition as now seems almost fabulous. He composed a new Latin grammar (1772), in which he aimed at combining the study of English and Latin, but the town-council prohibited him from teaching it. In 1791 he published his *Roman Antiquities*, the work which did most to promote his reputation, and which, though now generally superseded by more accurate and comprehensive dictionaries, was for many years the best manual of the kind in existence. His *Summary of Geography and History* appeared in 1794, his *Classical Biography* in 1800, and his *Latin Dictionary*—an abridgment of a larger work unfinished at his death—in 1805. On the 18th of Dec., 1809, Dr. A. died of a fit of apoplexy, the effect of intense study, by which he had been seized in his class-room five days before. “Amidst the wanderings of mind that accompanied it,” says prof. Pillans, the writer of his biography in the *Encyclo. Brit.* (8th edit.), and his successor in his chair, “he was constantly reverting to the business of the class, and addressing his boys; and in the last hour of his life, as he fancied himself examining on the lesson of the day, he stopped short and said: ‘But it grows dark; you may go,’ and almost immediately expired.”

**ADAM, ROBERT**, a distinguished architect, was born at Edinburgh in 1728. His father, William Adam, of Maryburgh, in Fifeshire, was also an architect of no mean repute. After receiving a university education, Robert A. proceeded in 1754 to Italy, and thence to Dalmatia, where he devoted some time, in conjunction with Clerisseau, a French architect, to exploring and making drawings of the ruins of Diocletian's palace at Spalatro. On his return to Britain he rapidly rose to distinction, was appointed architect to the king, and obtained extensive employment. The publication, in 1764, of the results of his labors at Spalatro, contributed to his reputation. In opposition to the heavy style of architecture prevalent at the time, A. introduced a taste for lightness and decoration, which, however, tended to the opposite extreme of weakness and triviality. Those, however, who form the lowest estimate of the general character of his designs, grant him the merit of having effected great reforms in British domestic architecture generally. In 1768 A. was elected M.P. for the county of Kinross. During upwards of twenty-five years, his practice, in partnership with his brother James, was more extensive than that of any other architect of the time. In 1773, the brothers commenced to publish a series of engravings of their chief designs, which was continued for some years. Robert died in 1792, and was buried in Westminster Abbey. The most generally admired of his works is the register house, Edinburgh. Kedleston hall, near Derby, is regarded by some as his greatest work. Among his other principal works are the university buildings and St. George's church, Edinburgh (both altered from the original design), the Glasgow infirmary, the Adelphi buildings, London, the screen to the admiralty, Caen-wood house, Luton house (altered), Lansdowne house, etc.

**ADAMANTINE SPAR.** See CORUNDUM.

**ADAM and EVE.** The narrative of the creation and fall of A. and E. is given in Genesis. To the scriptural account the later Jewish writers in the Talmud have made many tasteless additions. They tell us that the stature of A., when first created, reached to the heavens, while the splendor of his countenance surpassed that of the sun. The very angels stood in awe of him, and all creatures hastened to worship him. Then the Lord, in order to show the angels his power, caused a sleep to fall on A., and removed a portion of every limb. A. thus lost his vast stature, but remained perfect and complete. His first wife was *Lilith*, the mother of demons; but she fled from him, and afterwards E. was created for him. At the marriage of A. and E., angels were present, some playing on musical instruments, others serving up delicious viands; while the sun, moon, and stars danced together. The happiness of the human pair excited envy among the angels, and the seraph Sammael tempted them and succeeded in leading them to their fall from innocence.—According to the Koran, all the angels paid homage to A., excepting Eblis, who, on account of his refusal, was expelled from paradise. To gratify his revenge, Eblis seduced A. and E., and they were separated. Adam was penitent, and lived in a tent on the site of the temple of Mecca, where he was instructed in the divine commandments by the archangel Gabriel. After 200 years of separation, he again found E. on Mt. Arafat. Many other traditions of the Jews and the Mohammedans respecting A.

and E. may be found in Herbelot's *Bibliothèque Orientale*.—In the system of the Christian Gnostics and Manichæans, A. is one of the highest æons.—According to the Calvinistic theology, A. was the *covenant head* or *federal representative* of the whole human race, who were thus involved in the consequences of his breach of the *covenant* (q.v.) which God made with him at his creation. This view is supported by reference to the parallel drawn between A. and Christ in Rom. v. and 1 Cor. xv., in the latter of which chapters Christ is called, in contradistinction to A., "the second man," and "the last A."

ADAM DE LA HALLE, ADAMAURA, or "The Hunchback of Arras," one of the wandering poets or *trouvères* of the 13th c. He was in the suite of count Robert of Artois in 1282. A.'s works were superior to those of most of his contemporaries, and had enough of dramatic quality to secure for him a place among the founders of the drama in France.

ADAMAWA, the Mohammedan name of a country in central Africa, visited by Dr. Barth in 1851; 6° 30' to 11° 30' n., 11° 30' to 11° 16' e.; about 200 m. long by 70 wide; capital, Yola, a city of 12,000 inhabitants. A. is a sub-kingdom, composed of a mixture of pagan tribes conquered by the Foolah chieftain Adama, who subdued the region when it was known as the kingdom of Fumbina. It is a fine country, well watered, generally flat, rising towards the s. to 1500 ft. or more, with a few groups of mountains. Grass is plentiful; meat very dear, an ordinary goat being worth as much as a slave girl. Elephants are common; the *ayū*, an animal resembling a seal, lives in the rivers, feeding at night on the grass of their banks; and there is an indigenous ox, dark gray and less than three feet high. The standard of value is native cotton cloth 2½ in. wide, length indicating price. The Mohammedan population dress decently, some even well; pagans wear strips of leather around the loins. Slavery is universal—many individuals owning more than a thousand. There are a few Arab colonies. The governor of Yola calls himself sultan and receives an annual tribute of 5000 slaves, besides horses and cattle.

ADAMITES, a sect of fanatics who spread themselves in Bohemia and Moravia in the 15th and 16th c., but had no connection with the Hussites. One Picard is said to have been the founder of the sect about 1400. He styled himself Adam, the son of God, rejected the sacrament of the supper and the priesthood, and advocated the community of women. After his death, his followers spread themselves in Bohemia under several leaders. They even fortified themselves on an island in a tributary of the Moldau, and committed depredations around. They were detested as much by the followers of Huss as by the Catholics. Ziska (q.v.) made war against them, and slew great numbers; but they were never entirely rooted out. Even as recently as 1849, when the Austrian government declared religious liberty for all its subjects, certain members of this sect appeared and endeavored to gain proselytes. The official investigation into their character which took place at that time represents their creed as a mixture of freethinking, quietism, and communism. The members belong to the peasant or laboring class; and both men and women are generally industrious, temperate, and discreet in their ordinary course of life; but at their nightly meetings, at which they dispense with clothes, the utmost licentiousness is said to prevail.—As early as the 2d c., there was a sect of Gnostic tendency, called *Adamites*, who sought, by abstaining from all indulgence of the senses, to recall the state of innocence men were in before the fall. They therefore rejected marriage, and in order to exercise the virtue of continence went naked. They held that for those who had once attained the state of innocence all actions were alike indifferent—neither good nor evil. This doctrine led directly to the greatest licentiousness. Aberrations of this kind, under various disguises and modifications, have made their appearance from time to time in all ages of the world.

ADAMNAN, SAINT, a member of the early Irish church, to whom the world is deeply indebted for the information about that remarkable community which he left to posterity. His name was properly Adam, of which Adamnan is a diminutive. It is one of the peculiarities of that early church that the genealogies of its eminent members have been preserved with a minuteness scarcely rivaled in the days of peages. He was born in the co. of Donegal about the year 625. In the words of Dr. Reeves: "His father, Ronan, was sixth in descent from Connall Gulban, the head of one of the two great races of the northern Hy Neill, and in virtue of his birth claimed kin to St. Colomba and many of the sovereigns of Ireland. The father of Ronan was Tinne, from whom came the patronymic *Ua Tinne*, or grandson of Tinne, an appellation which is occasionally found coupled with A.'s name. Ronnat, the mother of A., was descended from Enna, son of Niall, whose race, the Cincl Enna, possessed themselves of the tract lying between the channels of the Foyle and Swilly, which was called the Tir Enna, or land of Enna, and answers to the modern barony of Raphoe. He was, like many of the eminent Irish clergy, a statesman as well as an ecclesiastic, and we hear of his being sent on missions from his own people to Alfred, king of Northumbria. In the year 679, he was elected abbot of Iona. His rule over that community was not, however, destined to be peaceful and fortunate. The views held by the Irish church about the holding of Easter and the form of the tonsure are now pretty well known as a chapter in the history of the church. However little their own importance might be, they are significant as the object of a bitter contest in which that church resisted the rules promulgated from Rome. In his intercourse with the Saxon

church, A. had adopted the Romish or orthodox views, as they are termed, and endeavored to put them in practice in his own community. He was thwarted in this object, and it is said that mortification at the failure caused his death. He d. in the year 704, on the 23d of Sept., which is the day of his translation in the calendar. He left behind him an account of the Holy Land, containing matters which he says were communicated by Arculfus, a French ecclesiastic who had lived in Jerusalem. It is valuable as the earliest information we possess of Palestine in the early ages of Christianity. But far more valuable is his *Vita Sancti Columbae*, his life of St. Columba, the converter of the Picts, and founder of Iona. Along with miracles and many other stories palpably incredible, this book reveals a great deal of distinct and minute matter concerning the remarkable body to which both the author and his hero belonged. The standard edition of the book is that of Dr. Reeves, edited in 1857 for the Bannatyne society of Edinburgh, and the Irish archaeological society which (with an English trans.) forms the 6th vol. (1875) of *Scottish Historians*. Nearly all the information to be had about the early Scoto-Irish church is comprised in that volume.

ADAMS, a co. of w. Illinois, on the Mississippi; 760 sq. m.; pop. '70, 56,362; Bear creek drains the n. part; the Quincy and Chicago and the Quincy and Eastern railroads pass through the co., and the Illinois and Southern Iowa forms a junction with the Quincy and Eastern. The surface is rolling and mostly covered with timber, but some portions are well cultivated, and there are several manufactories. Co. seat, Denver.

ADAMS, a co. in e. Indiana, bordering on Ohio; 324 sq. m.; pop. '80, 14,777. It is watered by the Wabash and St. Mary's rivers; mostly wooded; surface level and productive. Co. seat, Decatur.

ADAMS, a co. in s.w. Iowa, on the Nodaway river, and the Burlington and Missouri river railroad; 432 sq. m.; pop. '80, 11,874. It is an agricultural region. Co. seat Quincy.

ADAMS, a co. in s.w. Mississippi, on the M. river; 440 sq. m.; pop. '70, 19,084—14,287 colored. The land is highly productive. Co. seat, Natchez.

ADAMS, a co. in s. Nebraska, bounded n. by the Platte, and drained by the Little Blue river. The white population in 1870 was but 19.

ADAMS, a co. in s.w. Ohio, on the O. river; 500 sq. m.; pop. '70, 20,750. It is hilly, fertile, and adapted to fruit, timber, and sheep raising. Co. seat, West Union.

ADAMS, a co. in Pennsylvania, on the Maryland border; 530 sq. m.; pop. '70, 30,315. South mountain is on its southern border, and the co. is mostly uneven. Copper mines have been worked with some advantage, and there are marble quarries. Co. seat, Gettysburg, which has railroad communication to the e. and n.

ADAMS, a co. in central Wisconsin, on the W. river; 650 sq. m.; pop. '80, 6755. The surface shows chiefly forest and timber land, with abundant water power. Co. seat, Friendship.

ADAMS, a t. in Berkshire co. Mass., on the Hoosac river; pop. '75, 15,785; four villages in the town—North Adams, South Adams, Maple Grove and Blackington. In the t. is Greylock mountain, 3500 ft., highest in Mass. The w. end of the Hoosac tunnel is at North Adams, where two railroads terminate. The chief business is manufacturing, in cotton and woolen factories, paper mills and print works. At North Adams is the first successful employment (at shoemaking) of Chinese laborers; they engage for three years, and are faithful, honest and peaceable.

ADAMS, CHARLES BAKER; b. Mass., 1814, d. St. Thomas, 1853. He graduated at Amherst and was a naturalist; assisted prof. Hitchcock in geological survey of N. Y.; became tutor at Amherst, 1837; professor of chemistry and natural history in Middlebury college, Vt., 1838-47; professor at Amherst from 1847 till his death. In 1845-7 he was engaged in the geological survey of Vt. He went several times to the West Indies; wrote on conchology, and with assistance of Prof. Gray, of Brooklyn, published an elementary work on geology.

ADAMS, CHARLES FRANCIS, LL.D., b. Boston, 1807; son of John Quincy. He passed ten years in Europe with his father, and learned Russian, German and French. In 1817 he entered the Boston Latin school; graduated at Harvard college in 1825; studied law with Daniel Webster, and was admitted in 1828, but did not go into practice. In 1829, married a daughter of Peter C. Brooks, and became a brother-in-law of Edward Everett. In 1831 he was sent to State legislature, serving three years in the house and two in the senate. In 1848, candidate for vice-president with ex-pres. Van Buren on the free-soil ticket. In 1858, elected to congress; supported Lincoln with public addresses, in company with Wm. H. Seward. In 1861, appointed minister to England, and managed American affairs through the crisis of the war with much success. In 1871 he was one of the arbitrators for the U. S. at Geneva. He has broad scholarship, vigorous intellect, fine taste, and an independence in opinion which finds occasion for criticism in the policy of a party with which he may be in general agreement. Mr. A. has written much for the *North American Review*, the *Christian Examiner*, and the press generally; but his main work has been the biography of his grandfather, and editing the writings of both grandfather and father.

ADAMS, CHARLES FRANCIS, jr., b. Boston, May 27, 1835; son of preceding. He graduated from Harvard 1856, and was admitted to the bar in 1858; served loyally in the war of the rebellion, commanding a regiment of colored men, and mustered out with brevet rank of brig.-gen. Identified with railroad development, and writer for the *North American Review*; with his brother, Henry Brooks A., author of *Chapters of Erie, and other Essays*.

ADAMS, EDWIN, b. Mass., 1834, d. Philadelphia, 1877; an American actor. He first appeared at the Boston National theater, Aug. 29, 1853, as *Stephen* in "The Hunchback;" went through the country, acting *Hamlet*, in 1860; was with Kate Bateman, Henry Placide and Jas. W. Wallack at N. Y. Winter garden in 1860; reappeared in N. Y. in 1863 as *Robert Landry* in "The Dead Heart;" was in the company when Booth's theater opened, Feb. 3, 1867, and played *Mercutio* and *Enoch Arden* in that house. He lost his health in Australia.

ADAMS, HANNAH, b. Mass., 1755, d. 1832, one of the earliest American female writers; author of *Views on Religious Opinions*, 1784; *History of New England*, 1793; *Evidences of Christianity* 1801; *History of the Jews*, 1812; all of which brought fame but little money. Hers was the first body buried in Mt. Auburn cemetery.

ADAMS, HENRY BROOKS, son of Charles F., and his father's private secretary in London. In 1870 he was appointed assistant professor of history at Harvard, and became editor of the *North American Review*.

ADAMS, JOHN, the second president of the U. S. of N. Am., was born at Braintree, in Mass., on the 19th of Oct., 1735. His parents were descended from a Puritan family which had emigrated from England to Mass. in 1640. Before the revolution, A. had distinguished himself as a jurist, and wrote in the *Boston Journal* an essay on *Canon Law and Feudal Law* (1765). He was sent by Mass. to the congress which commenced its sittings in Philadelphia in 1774. With Lee and Jefferson, he boldly argued for a separation from the mother-country; and Lee's proposition of a declaration of independence was carried on the 4th of July, 1776. A. and Jefferson had been appointed to draw up the Declaration of Independence, but it appears that Jefferson is the sole author of it. In succeeding years, A. was employed on many important negotiations with European powers; among others, he assisted Franklin, Jay, Jefferson, and Laurens, in 1782, in settling the conditions of peace with England. In 1785 he came to London as the first ambassador from the Union. George III. expressed his pleasure in receiving an ambassador who had no prejudices in favor of France, the natural enemy of the English crown, and A. replied: "I have no prejudices but in favor of my native land." He published in London his *Defense of the Constitutions of Government of the United States* (3 vols. 1787). On his return to America, in the same year, he was elected as vice-president of the U. S., and on the retirement of Washington (in 1797) became president. The enmity of the democratic party, which had already been excited against him, was now increased by the measures which he judged necessary to uphold the national honor against the pretensions of France, and still more by his decided favor for a hereditary aristocracy. In 1801, when his term of four years of office had expired, his adversary Jefferson was elected by a majority of one vote. A. now retired to his estate of Quincy, near Boston, where he occupied himself with agricultural pursuits. After this retirement, he received many proofs of respect and confidence from his countrymen. When 85 years old, we find him still in his place as member of the convention appointed (1820) to revise the constitution of Mass. He d. on the 4th of July, 1826, on the fiftieth anniversary of the day when he had proclaimed in congress the independence of the U. S.

ADAMS, JOHN, (*ante*). John Adams was the great-grandson of Henry, the English emigrant; his father was a deacon of the church and selectman, a farmer of small means and a shoemaker, but he gave John a good education at Harvard, whence he went to Worcester and took charge of a school. He was ambitious, and only lacked influence to get into the army; then he thought of divinity, but the confusion and wrangling of sects dismayed him, so he settled on law. In 1764 he married Abigail Smith, daughter of the minister at Weymouth, and a person above his social position. She proved a good wife and mother and made his home happy. Soon after marriage he went into politics with other opponents of the stamp act and parliamentary oppression. He was selected as one of the counsel of the town of Boston, the others being Jeremiah Gridley, the head of the bar, and James Otis, the famous orator. They were to present to the governor and council a memorial asking that courts might proceed with business though no stamped paper was to be had. As junior, Adams opened the business, taking the bold stand that the stamp act was void because parliament had no right to tax the colonies. The repeal of the act soon after ended the matter. About this time he began to write on "Taxation" in the *Boston Gazette*, and some of his articles were reprinted in a London paper. In 1768 he moved to Boston, and two years later was elected to the general court, though at the time he was retained to defend capt. Preston in the Boston massacre affair, who was acquitted in spite of the great prejudice existing. In the general court he began to be a leader of the patriot party, and though he soon resigned was consulted upon all important matters by governor Hutchinson. About this time he wrote articles on the independence of the judiciary and the payment of the salaries of judges by the crown. The destruction of the tea brought on the crisis and produced the congress of 1774, of which

A. was one of the five Massachusetts members. There he took active part in the discussion of colonial independence, and when a declaration was agreed upon he was chosen to put the resolutions in shape. Returning home he was chosen to the provincial congress, then in session, which had substantially declared war by appointing a committee of safety, seizing the provincial revenues, appointing general officers, collecting stores and beginning to form an army. After the adjournment of this congress his pen was again at work and the "Novanglus" articles appeared in answer to pro-British papers signed "Massachusettensis." This work was interrupted by the battle of Lexington, and A. hurried to the congress in Philadelphia, which body soon became the chief authority in the colonies. Adams was satisfied that reconciliation was impossible, though a majority in congress thought differently. The siege of Boston had begun, and Adams claims that he first suggested Washington for the chief command in order to secure the active help of the Virginia delegates; but he insisted that gen. Artemus Ward should be second, which place the Virginians wanted for Lee; Lee was made third in rank. While absent from congress some of his correspondence was made public, in which he spoke very freely of his colleagues, especially John Dickinson, who, with some others, became his personal enemy for life. He was a hard worker in congress, chiefly in committees; was on the naval committee, and his rules then written are the basis of our present naval code. Late in 1775 he was appointed chief justice of Mass., but never took the seat, resigning the next year. In congress freedom was slowly gaining ground; A. was in favor of the adoption of self-government by each of the colonies, then a confederation, and then treaties with foreign powers. May 13, 1776, he carried the first proposition, and the others naturally followed. A resolution by Robt. H. Lee offered under instructions of the Virginia convention, that the "colonies are by right and ought to be free and independent," was warmly supported by A. and carried by seven states to six. A. was put on the committee on the declaration and on foreign affairs, and was chairman of the congressional board of war, in fact the war department, where he gave the hardest labor for 18 months, and almost alone created such a war department as we had; and in this and other work he gained the reputation of "the clearest head and firmest heart of any man in congress." Near the close of 1777 he was appointed commissioner to France to supersede Silas Deane. The French alliance was already made, and Franklin commissioned as ambassador. A. came home in 1779 in the ship with our first minister from a foreign power. He was made a member of the Mass. constitutional convention, but was immediately appointed minister to Great Britain to treat for peace, and returned to Europe in the same frigate that had brought him home. Soon after arrival in London he went to Holland to negotiate a loan, and was made minister to that country while there. He secured a loan of \$2,000,000. After peace, with which he had much to do, he was sent as minister to England, and arrived in London in May, 1785. He was civilly but coldly received, and his situation was anything but agreeable; so, at his request, he was recalled in 1788. While in England he prepared his *Defense of the American Constitution*, a work which subjected him to the charge of anti-republican and even monarchical tendencies. Under the newly organized federal government he became vice-president, and gave probably more casting votes in the senate than all vice-presidents since; giving about twenty, nearly all to support Washington's policy or on some important organic law. Up to this time A. and Jefferson had generally agreed, but differing views of the French revolution separated them widely—A. vehemently denouncing that outbreak as a great evil. The strife became so warm that when the second presidential election came on, the friends of Jefferson nominated George Clinton for vice-president against A., but failed to defeat him. With Washington, A. heartily supported the plan of neutrality, while the Jeffersonians were eager for discriminations against England. Washington declined a candidacy for a third term, and then came our first partisan contest for president; Adams, Hamilton, Jay, Jefferson, and Thomas Pinckney were more or less in the field. In the electoral college A. barely prevailed, having 71 votes to 69 for Jefferson; (as the law was then the electors voted for two men without designating the office—the highest vote made the president, and the next highest the vice-president). A. charged Hamilton with dividing the vote of the north and east, and that, with other contemporaneous troubles, broke up the federal party. Our French relations were in a critical state when A. took the chair; our minister, James Monroe, had disregarded his instructions and led us into difficulty with the wily Talleyrand, and the exposure of this entanglement aroused a strong anti-French feeling and revived the old federal party; but some unlucky appointments by A., such as Vans Murray for minister to France, soon checked this resurrection. When the new commission reached France, Bonaparte was in power, and there was no further difficulty. When the election of 1800 came on, the federal party was only in fragments; the republicans (soon to be democrats) were strong and growing rapidly under such skillful leaders as Jefferson and Burr. A. was still popular with the people, but his opponents loaded him down with the French troubles, the alien and sedition laws, and many sins of which he was not guilty; his private correspondence was exposed, and to all, as in Washington's case, was added the charge that he selected his cabinet under British influence. There was no choice of president by the people's election: Jefferson had 73 votes, Burr 73, Adams 65, Pinckney 64. After many ballots the house of representatives chose Jefferson for president and Burr for vice-president, and on the day of inauguration John Adams left office without waiting to see

his opponent take the chair. He had no intercourse with his successful rival for thirteen years. A. at once quitted public life; he had been frugal and was not without estate, and his home was happy, until the death of his second son; his hope, however, was in his son John Quincy, whom he desired to see seated in the presidential chair. Few men have fallen so suddenly from high political importance to zero; in the last year of his term he received and wrote letters by thousands; the next year he received hardly a hundred. He lost the favor and got the spite of both parties. He was bitterly assailed long after he left office, and his misdeeds were even used in the campaign against his son in 1824. But though his official utterances were stopped, his pen was busy. He defended himself in the newspapers, and brought to light many important historical facts. After Jefferson left public life he and A. were reconciled and corresponded during the remainder of their lives, both dying on the same day, the day of fall in which they might desire to go—July 4, 1826, the semi-centennial anniversary of the declaration of independence in which both had taken deep personal interest. When A. was in his 86th year he was chosen a delegate to the convention to revise the Mass. constitution, and did much to bring about a modification of sections respecting religion and support of churches, for with years he had grown liberal, even ahead of his time. In person he was above medium height, with a stout, well-knit frame, growing corpulent with age; large head, wide and expansive brow; a mild and even humorous eye; general aspect grave and imposing; he delighted in society and conversation and was a good talker; affections warm but not particularly demonstrative; anger violent and soon cooled, and without malevolence; impatient of cant and of opposition to his well-established views.

ADAMS, JOHN, the assumed name of Alexander Smith, one of the mutineers of the English ship "Bounty;" b. London, 1764, d. Pitcairn island, Mar. 29, 1829. Nine months after the mutiny A. and his sailors, with some men and women from Tahiti, landed on Pitcairn island and formed a government of which he was the head. In 1800 he was the only surviving Englishman. He established worship and such a school as was possible. In 1808, capt. Folger, an American, landed there and brought the world the first news of this strange settlement. A. had not heard a word from civilized countries in 20 years. England never sought to punish him, and he died in peace, leaving a prosperous and religious people.

ADAMS, JOHN, LL.D., 1772-1863; teacher and philosopher. He graduated at Yale 1795; was principal of two or three academies; went to Ill., where he introduced valuable modifications in school laws, and organized many Sunday-schools. He wrote on educating and training the young.

ADAMS, JOHN COUCH, discoverer, simultaneously with Le Verrier, of the planet Neptune, was born near Launceston in Cornwall, 1819. He early manifested an aptitude for mathematics; and after the usual amount of school-training, he was sent to St. John's college, Cambridge, where he attained the honor of senior wrangler, and became a mathematical tutor. In 1841, he undertook to find out the cause of the irregularities in the motion of Uranus, anticipating, indeed, his own and Le Verrier's discovery—namely, that they are due to the influence of an unknown planet. Le Verrier did not commence his researches till the summer of 1845; but on the 10th Nov. published the results of his calculations, demonstrating the existence of an unknown planet, declaring it to be the cause of the known disturbance, and assigning to it almost the same place as A. had done in a paper which he left with the astronomer royal at Greenwich observatory in the previous Oct., but which he neglected to publish. Le Verrier has thus acquired, naturally, the whole honor of the discovery; but the merit of A. is not less. The researches of the latter commenced earlier; his discovery, too, was earlier; and it was only unfortunate for the reputation of the young astronomer that he omitted to publish the results he had obtained. The council of the royal astronomical society showed that they appreciated the value of A.'s labors, by awarding equal honors to both. In 1858, A. was appointed to the chair of mathematics in St. Andrews, which, however, he vacated within a few months, on being nominated to the Lowndean professorship of astronomy, Cambridge.

ADAMS, JOHN QUINCY, the sixth president of the U. S. of North America, and son of the second president, was born in Mass., July 11, 1767. In his boyhood he accompanied his father on an embassy to Europe, and passed a considerable part of his youth in Paris, at the Hague, and lastly in London. When his father was elected president, the younger Adams was sent on an embassy to Berlin, and traveled through Silesia. Of this country he gave a description in his letters, which were first published in the *Portfolio*, a Philadelphia journal, and afterwards translated into French and German. In his political views, A. perfectly agreed with his father, and consequently he was recalled from Berlin when Jefferson was elected president in 1801. On his return to America, he was engaged as professor of rhetoric, at Harvard university, in Mass., the stronghold of the federalists; but he soon left his academical post to engage again in politics, and was chosen a senator for Mass. He soon became prominent as a leader of the federal party; but in later years he adroitly changed his course, and seemed inclined towards the party of Madison. By Madison he was sent as plenipotentiary to Russia, and afterwards to England. On this embassy he took a part in the negotiation of peace with England, and assisted with his counsel the deputies sent from America to Ghent. When Monroe was elected president, he recalled A. from Europe, and made him secretary of state. On the retirement of

Monroe from office, A. gained the presidency, after a hard contest against Jackson, in Feb. 1825. He had now to strive against democratic majorities; for, though he endeavored to make himself popular by betraying the schemes of his former political associates, he could never win the confidence of the growing party of democrats; and on the expiration of his term of office, he had to give place to gen. Jackson. A. retired to his estate of Quincy, near Boston; but in 1830 was chosen as representative of his district. He now joined the party of abolitionists, and frequently raised the whole house of representatives against himself by his incessant petitions on the slavery question. On one occasion, in 1842, in order to assert strongly in the abstract the right to petition, he went so far as to present a petition for the dissolution of the union! This was misunderstood, and turned against him. He died at Washington during the session of congress, Feb. 23, 1848. A. was one of the most able among American statesmen of the old school, and a skilled diplomatist. See *Memoirs of A.*, vols. i. and ii., 1874.

ADAMS, JOHN QUINCY (*ante*). Under the advantages secured while with his father abroad, John Quincy became one of the best educated men of his time. He graduated from Harvard in 1788, and studied law with Theophilus Parsons three years; was admitted to the bar in 1791, and mixed law practice with writing for the newspapers, especially discussing French neutrality and Tom Paine's *Rights of Man*. In 1794 Washington appointed him minister at the Hague; in 1797 he married the daughter of Joshua Johnson, formerly a merchant at Nantes. On Washington's written advice, president Adams appointed him minister to Berlin, where he learned German and translated Wieland's *Oberon*, but did not publish it, because Sotheby's translation just then appeared. Jefferson recalled him, and in 1802 he was a member of the Mass. legislature. When only 36 years of age he was elected senator in congress, but soon afterwards resigned. In 1806 he was professor of rhetoric and belles lettres in Harvard. About this time may be noted the first appearance of the sectional ideas which culminated in the war of the rebellion of 1861-5. During a visit to Washington, A. had a conference with Jefferson in which he charged a portion of the federal leaders with a design of dissolving the union and establishing a separate northern confederacy. This charge was often repeated, and for a dozen years it seriously affected the administration of the government, reducing the statesmen of New England to a position of much less weight and influence in public affairs than they were entitled to or had enjoyed, and very probably restricting Mr. A. to his one term of the presidency. This idea was said to have originated with certain federal members of congress because of the acquisition of Louisiana, and the threatened destruction, by additions of southern and southwestern territory, of the political influence of the n. and e. A. said that these members of congress were to have a meeting in Boston, at which Alex. Hamilton would be present, though he did not approve of their ideas. In 1809 Madison sent A. as minister to Russia, and during his residence there he was made associate justice of the U. S. supreme court, but declined the honor. In Russia he had much influence, inducing the emperor to offer himself as mediator between our country and Great Britain. In 1813 he was, with Henry Clay, Albert Gallatin, and Jonathan Russell, a commissioner to negotiate peace with Great Britain, which was effected at Ghent after six months' work, and signed Dec. 24, 1814. The next spring A. was made minister to England, and was there until Monroe called him home to be secretary of state, in which position he had important work in defending gen. Jackson's conduct in Fla. against Spain, in the Miranda expedition, and in the question of the La. boundary, in which the Sabine river was accepted as a compromise. Near the end of Monroe's first term the strife between slavery and freedom began on the occasion of the bill admitting Missouri, sent to Monroe for his signature. He submitted two questions to his cabinet: 1. Has congress constitutional power to prohibit slavery in a territory? 2. Was the term "forever" in the prohibitive clause forever absolutely, or only during the territorial condition of the country specified? On the first question all the cabinet voted yea; on the second A. thought "forever" covered state as well as territorial condition, but all the others held the other view. To harmonize matters, Calhoun suggested the broader question, "Is the proviso as it stands in the bill constitutional?" And on this all voted yea. In 1824, Adams, Jackson, Crawford, and Clay, all democrats, were candidates for president. In the colleges the vote was 99 for Jackson, 84 for Adams, 41 for Crawford, and 37 for Clay. In the house A. was chosen, as it was charged, by the influence of Clay, whom he made secretary of state. As soon as A. was in office all the other factions of the democracy united against him and in favor of Jackson; both houses of congress were against him for the latter part of his term, and he was assailed with the most unscrupulous and vindictive bitterness. For his second term he got only 83 votes to 178 for Jackson. He retired to Quincy, but not to idleness. A long political life had closed; a shorter and more important one was about to open. A new party, the anti-masons, sent him to congress, and his district kept him there for seventeen years, during which he was almost ever at his post and always at work. In 1834 he was a candidate for governor of Mass., but was beaten by John Davis, who not long after beat him for U. S. senator. Free from all parties and cliques, A. became the people's champion, especially as to the right of petition, which the southern congressmen were ever anxious to restrict. Everybody soon knew that though he might oppose the purpose sought, A. would promptly present any respectful petition. This was fully

tested in 1837, when he astonished everybody by presenting a petition from actual slaves; and compelled its reception, notwithstanding the uproar which it created. By degrees he gravitated towards the abolitionists. Though not identified as one of them, he was always the champion of the right of petition. He secured the repeal of the notorious gag rule; he defended the slave mutineers of the *Amistad*, and was ready, anywhere and everywhere, to stand up for free speech. On the 26th Nov., 1846, when leaving Boston to take his seat in congress, he had an attack of paralysis, and was kept away four months; after that he was at his post, but seldom spoke. On the 21st of Feb., 1848, came a second attack, while he was in his seat in the house; he was taken to the speaker's private room, and d. on the second day after, his last intelligible words being, "This is the last of earth; I am content." Like his father, he was a Unitarian in his religious views, though not extreme; also, like his father, he kept voluminous diaries and journals, which have been in some degree arranged and published by his son.

ADAMS, JOHN QUINCY, 2d, b. Boston, 1833; son of Charles Francis; graduate of Harvard. He was admitted to the bar in 1855; was on gov. Andrew's staff in the rebellion; in 1866 a representative in the legislature; in 1867 democratic candidate for governor, and defeated. In 1869-70 he was in the legislature; in 1871 he was an unsuccessful candidate for governor and representative. In 1872 was nominated for vice-president with Chas. O'Connor for president, by democrats who would not support Horace Greeley; but O'Connor peremptorily refused, and A. would not stand without him. He has made many able and elaborate speeches.

ADAMS, NEHEMIAH, D.D., 1806-78; a graduate of Harvard, and student of divinity at Andover. In 1829 he was settled over the first Congregational church in Cambridge, and in 1834 over the union Congregational church in Essex st., Boston; author of *Remarks on the Unitarian Belief*, *The Friends of Christ in the New Testament*, *Life of John Eliot*, *Christ as a Friend*, and other religious books. After a winter in Georgia for the benefit of his health, where he lived with a rich planter, he wrote *A South-side View of Slavery*, praising its effect upon the religious character of the negroes. The work brought upon him severe animadversion. In 1869-70 he made a voyage around the world. As a writer he was greatly admired for the finish and delicacy of his style.

ADAMS, SAMUEL, one of the leading men of the American revolution, was born at Boston, Mass., Sept. 27, 1722. His political leanings were early manifested; on taking the degree of A.M. at Harvard college, 1743, he maintained the affirmative of the question: Whether it be lawful to resist the supreme magistrate, if the commonwealth cannot be otherwise preserved? He intended at first to become a clergyman, but afterwards commenced a small business, and was made collector of taxes. He displayed on all occasions an unflinching zeal for popular rights, and was, by the patriotic party, placed in the legislature in 1766. A. was a member of the first congress, and signed the declaration of independence in 1776. He took an active part in framing the constitution of Massachusetts, and was for several years president of the senate of that state. He held the office of its lieutenant-governor from 1789 to 1794, and of governor from that time till 1797. He then retired from public life, and died at Boston, Oct. 2, 1802, poor as he had lived. A.'s character was one of great courage and determination. He was, at the same time, somewhat narrow-minded and bigoted, both in religion and politics. He was prejudiced against Washington, whose conduct of the war and his ignorance of military matters led him to think weak and dilatory; and the confidence reposed in Washington, as first president of the republic, seemed to A. to savor of aristocracy.

ADAMS, SAMUEL (*ante*), a great-grandson of Henry A., an English emigrant, from whom president John A. traced his descent. Samuel began to study law, disliked it, and went into a counting-house; became a merchant and failed; was partner with his father in a brewery, and failed after the father's death; went into politics on a paper-money question then prominent in the colony, and soon became an advocate for the people against parliamentary authority. Through him, under instructions of the town of Boston, was heard, in May, 1764, the first protest from America against lord Grenville's plan for taxing the colonies. While in the colonial legislature he acted as clerk of that body, and drew up most of the papers. He is thus described in John Adams's diary: "Adams is zealous, ardent, and keen in the cause; is always for softness, delicacy, and prudence, when they will do; but is stanch and stiff and strict and rigid and inflexible in the cause." While he was engaged in politics his wife supported the family. She died in 1757, and in 1764 he married again. He was spokesman of a committee to demand the removal of the troops after the Boston massacre, and by his boldness effected the purpose. In the Philadelphia congress he was at first conciliatory; yet no one did more to effect the separation from England, as gen. Gage testified when he excepted only "John Hancock and Sam Adams" from an offer of pardon. Adams did not like the federal constitution, but Hancock persuaded him to support it in the Massachusetts convention, though he proposed several amendments, some of which were adopted. He was an admirer of the French revolution, and in home politics inclined towards Jeffersonian views. He is described as of usual size, muscular, with light-blue eyes, fair complexion, erect and dignified; wearing a tie wig, cocked hat, and red cloak. He was poor till near the end of his life, when by the death of his son, a surgeon in the revolution, he received enough to live upon. He was the author of many state papers and political newspaper articles; but an oration said to have been spoken by him in Phila-

delphia, Aug. 1, 1776, and printed in London, is reckoned spurious. In this oration the English are called "a nation of shopkeepers," an epithet which was quickly adopted by the first Napoleon. Adams left only a daughter, and none of his blood now bear the name.

ADAMS, THOMAS, an English preacher in the early part of the 17th c., called by Southey "the prose Shakespeare of Puritan theologians." He was minister at Wilington Wingrave, in London, and "observant chaplain" to Sir Henry Montague, the lord chief justice. He wrote *Heaven and Earth Reconciled*, *The Devil's Banquet*, and other works, and a great number of his sermons were printed. A. was a Puritan within the church of England, as distinguished from the non-conformist Puritans who left the church. "Jeremy Taylor did not surpass him in brilliance of fancies, nor Thomas Fuller in wit."

ADAMS, WILLIAM, D.D., b. Conn., 1807; son of John, LL.D. He graduated from Yale in 1827; studied theology at Andover and was ordained a Congregational minister. In 1834 he left his parish in Brighton, Mass., and took charge of the Central (now Madison square) Presbyterian church, in N. Y., where he continued more than forty years. Dr. Adams is renowned as a pulpit orator, and has been prominent in many works of charity and usefulness. He was moderator of the general assembly of 1853, and took an active part in securing union between the old and new school parties in his church. He has published several sermons, addresses, and other works. He was elected professor of sacred rhetoric and pastoral theology in the N. Y. university, but declined the position. Having resigned his pastorate, he became a professor of the union theological seminary (Presbyterian) in the city of N. Y. He died Aug. 31, 1880.

ADAMS, WILLIAM T., b. Mass., 1822; well known as a writer of works for the young, editor of *Oliver Optic's Magazine for Boys and Girls*, and also as a magazine and general writer.

ADAM'S BRIDGE, a chain of shoals extending across the gulf of Manaar, between Ceylon and the peninsula of Hindustan. It forms a great obstruction to vessels proceeding through the channel.

ADAM'S PEAK, the name given by Mohammedans, and after them by Europeans, to a mountain summit in the s. of Ceylon, 7420 ft. high (not, however, the highest of the group). The native name is Samanliela. The cone forming the summit is a naked mass of granite, terminating in a narrow platform, in the middle of which is a hollow, 5 ft. long, having a rude resemblance to a human footstep. Mohammedan tradition makes this the scene of Adam's penitence, after his expulsion from paradise; he stood 1000 years on one foot, and hence the mark. To the Buddhists, the impression is the *svi-pada*, or sacred footmark, left by Buddha on his departure from Ceylon; while the Hindus claim it as the footprint of their god Siva. Over the sacred spot stands a wooden canopy, and multitudes of devotees, Buddhist, Hindu, and Mohammedan, frequent it.

ADANA, a Turkish ejalet or province in the s.e. of Asia Minor, derives its name from its chief city Adana, containing 25,000 inhabitants. The city is distant almost 30 m. from Tarsus, on the way to Aleppo, commands the pass of the Taurus mountains, and carries on a considerable trade between Syria and Asia Minor. Pompey peopled the territory of Adana with pirates. The Syrian kings made the place a city, under the name of *Antiochia ad Sarum*, and on the ruins of Antiochia the caliph Haroun al Raschid built Adana. The present inhabitants are mostly Turks, mixed with some Greeks and Armenians.

ADANSON, MICHEL, a celebrated French botanist, b. at Aix, April 7, 1727. He soon left the clerical profession, for which he was educated, and devoted himself to the study of natural history. In his early career he entertained the ambition of superseding the Linnaean system by a clearer and more comprehensive method of arrangement. When about twenty-one years old he went to Senegal in Africa, and, fearless of the unwholesome climate, stayed there five years, afterwards returning to France with a large collection of specimens in natural history. Soon after his return, he laid before the French East India company his plan of a colony on the African coast, in which all colonial produce was to be raised without slave-labor. But his plan was neglected. He published, in 1757, his *Histoire Naturelle du Sénégal*, and, in 1763, his *Familles des Plantes*, in which he endeavored to give a new form to botany; but he could not prevail against the established Linnaean system. His next undertaking was one on a vast scale—nothing less than a complete encyclopedia, for which he hoped to gain the patronage of Louis XV. and the academy; but though his bold plan was regarded with admiration, he received little substantial encouragement. This, however, did not check his enthusiasm; he proceeded with the work until he exhausted his means. During the revolution he fell into very indigent circumstances. When invited to become a member of the national institute, he answered that he was unable to attend for want of a pair of shoes. Afterwards he received a pension, and until the time of his death, Aug. 3, 1806, he was earnestly devoted to the prosecution of his plan, too vast to be carried out by an individual.

ADANSONIA, a genus of the natural order *sterculiaceæ* (q.v.), sub-order *bombacæ*, named by Linnaeus in honor of the botanist Adanson (q.v.), and distinguished by a

simple deciduous calyx, a very long style, with numerous stigmas and a woody capsule containing a farinaceous pulp. The only known species, *A. digitata*, the *baobab*, also called the monkey-bread tree, is a native of the tropical parts of w. Africa, but now introduced into the e. and w. Indies. It is the largest known tree—not indeed rising to a very great height, but exceeding all other trees in the thickness of its trunk (20 to 30 ft.). Even its branches (60 to 70 ft. long) are often as thick as the stems of large trees, and they form a hemispherical head of 120 to 150 ft. in diameter; their outermost boughs drooping to the ground. The leaves are digitate or 7-fid; the flowers are white and extremely large, on drooping peduncles of a yard in length. The fruit (*monkey-bread*) is of the size of a citron. The bruised leaves (*lalo*) are mixed with the daily food of the inhabitants of tropical Africa; and Europeans in that country employ them as a remedy for diarrhea, fevers and diseases of the urinary organs. The pulp of the fruit, which is slightly acid and pleasant to the taste, is eaten with or without sugar; and the expressed juice mixed with sugar is much esteemed as a beverage, being very refreshing, effectual in quenching thirst, and regarded as a specific in putrid and pestilential fevers. The bark is said to be powerfully febrifugal.

**ADAPTATION**, in biology, is the process by which an organism becomes modified to suit the conditions of its life. Every change in a living organism involves A.; for in all cases life develops itself in a continuous adjustment of internal to external relations. But the term usually implies such modifications as arise during the life of an individual, when an external change directly induces some change of function and structure. All A. is limited, since an organism can vary from its congenital structure only to a certain limited extent.

**ADAR**, the twelfth month of the ecclesiastical and the sixth month of the civil Jewish year; according to the rabbins, from the new moon of Feb. to the new moon of March. On the 17th of A. comes the fast for the death of Moses; the 13th is called the fast of Esther, and by common usage is a festival in memory of the death of Nicanor. On the 14th and 15th occurs the important feast of Purim.

**ADDA**, the Latin *Addua*, a river of Lombardy, rising in the Rhaetian Alps above Bormio. It flows into the lake of Como; issuing from which below Lecco, it traverses the plain of Lombardy in a direction s.s.e., passing Lodi and Pizzighetone, and falls into the Po about 8 m. above Cremona. It formerly bounded the republic of Venice and the duchy of Milan.

**ADDAX**. See ANTELOPE, *ante*.

**ADDER**, a common English name of the viper (q.v.), but also often more vaguely used for poisonous serpents of the family *viperidae*. Where the name occurs in the authorized version of the scriptures, it appears to be always in this vague sense; although the terms in the same places of the original may probably be more precise. A very venomous serpent of New South Wales (*acanthopsis tortor*) is sometimes called the *death* or *black Adder*.

**ADDINGTON**, a co. in the province of Ontario, Canada, near the e. end of lake Ontario; 2000 sq.m.; pop. '71, 21,312. It has many small lakes. The n. part is little settled. Agriculture and lumber are the main business. Chief t., Bath.

**ADDINGTON, HENRY** (lord Sidmouth), 1757–1844; son of Dr. Addington, who was physician to the earl of Chatham, by reason of which the son became playmate and friend of the younger Pitt, who induced him to enter parliament in 1784. In 1789 he was elected speaker of the commons. When Pitt resigned he took the place of chancellor of the exchequer and formed a new ministry, but met so much opposition that he resigned in 1804, whereupon the king made him viscount Sidmouth. He was home secretary in 1812, and retired in 1824.

**ADDISCOMBE**. See CADET.

**ADDISON**, a co. in Vermont, on lake Champlain, drained by Otter creek and intersected by the Rutland and Burlington railroad; 750 sq.m.; pop. '80, 24,174. The w. part is flat, and the e. mountainous: the soil is fertile, and there are manufactures of cotton, wool and paper, and marble quarries. Co. seat, Middlebury.

**ADDISON, JOSEPH**, the son of an eminent clergyman of the church of England, was b. at Milston, near Amesbury, in Wiltshire, on the 1st May, 1672. After a preliminary education at various schools, he entered the university of Oxford when only fifteen years of age, where he greatly distinguished himself, especially by the facility with which he wrote Latin verse. He was originally intended for the church, but various circumstances conspired to draw him aside into literature and politics; the principal of which were his acquaintance with Dryden, who honored the young poet with his patronage, and his intimacy with lord Somers, whose favor he gained by dedicating a poem to him on one of king William's campaigns. In 1699 he received a pension of £300 a year, and then set out on a continental tour. While in France he perfected himself in the language of the country. On the outbreak of the Spanish war of succession he departed to Italy, where he penned his charming *Letter* to lord Halifax. Towards the end of 1703, he returned home by way of Switzerland and Germany; but his expectations of a

"place" were disappointed, for the whigs were out of office. The battle of Blenheim, however, which occurred in the next year, presented a brilliant opportunity to him, which he did not fail to make the most of. The ministry wished the victory commemorated in verse, and A. was appointed to do it. Lord Godolphin, the treasurer, was so excessively delighted with the first half of the triumphal poem, that before the rest was finished he made A. a commissioner of appeals. The poet was now fairly involved in politics. He accompanied Halifax to Hanover, became under-secretary of state in 1706, and in 1709 went to Ireland in the capacity of secretary to the lord-lieutenant, where he also obtained the office of keeper of the records, worth £300 a year. In the same year his friend Steele commenced *The Tatler*, to which A. soon became a frequent contributor. He also wrote a number of political articles in the *Whig Examiner*. On the 1st of Mar. 1711, appeared *The Spectator*, the most popular and elegant miscellany in English literature. With an interruption from 6th Dec., 1712, to 15th June, 1714, during part of which time *The Guardian*, a similar periodical, took its place, *The Spectator* was continued to 20th Dec., 1714. A.'s fame is inseparably associated with this periodical. The quality of his genius is now determined by it rather than by the artificial rhetoric of his *Cato*. He was the animating spirit of the magazine, and by far the most exquisite essays which appeared in it are by him. In 1713 appeared *The Tragedy of Cato*, the popularity of which, considering its total want of dramatic power, was amazing. It was generally understood to have a political as well as a poetical inspiration; but so prudently had A. expressed himself, that both parties, whig and tory, received its frigid declamation with rapture. It was translated into various European languages, and even the monarch of French criticism, Voltaire, held Shakespeare a barbarian in tragedy compared with our author. "All the laurels of Europe," says Thackeray, "were scarcely sufficient for the author of this 'prodigious' poem." Every one in England praised it except Dennis. A. was called the "great Mr. A." after that wonderful night in the theater, when, as Pope says, "the numerous and violent claps of the whig party on the one side were echoed back by the tories on the other." This enthusiasm was a delusion which time has effectually dispelled. In 1716, A. married the dowager-countess of Warwick, and in the following year was appointed secretary of state. For neither of his new situations was he at all suited. Lady Mary Wortley Montagu, in a letter to Pope, expressed her fear that "a day might come when he would be heartily glad to resign both." He was so extremely timid and awkward in large companies that it was out of the question for him to attempt debating in parliament—a thing indispensable to one in his position. He consequently resigned in 1718. Then as to the other matter, Dr. Johnson sarcastically remarks that "the lady was persuaded to marry him on terms much like those on which a Turkish princess is espoused—to whom the sultan is reported to pronounce: 'Daughter, I give thee this man for thy slave.'" No one can doubt that this marriage was a mistake on the part of A. His health had been for some time in a very precarious state; and at length, after an illness of a few months, he died at Holland house, Kensington, on the 17th June, 1719, in the 48th year of his age, three years after what Thackeray calls "his splendid but dismal union." A. had appointed Mr. Tickell his literary executor, who published his works shortly after in 4 vols. quarto. Besides those to which we have incidentally alluded, he wrote *A Treatise on the Usefulness of Ancient Medals, Especially in Relation to the Latin and Greek Poets*, which, however, excited little interest. He also left an unfinished work on *The Evidences of the Christian Religion*. But the most delightful and original of all his productions is that series of sketches in *The Spectator* of which Sir Roger de Coverley is the central figure, and Sir Andrew Freeport and Will Honeycomb the side ones. Sir Roger himself is an absolute creation; the gentle yet vivid imagination, the gay and cheerful spirit of humor, the keen, shrewd observation, and fine raillery of foibles which A. has displayed in this felicitous characterization, render it a work of pure genius. But A. in prose is always excellent. He has given a delicacy to English sentiment and a modesty to English wit which it never knew before. Elegance, which in his predecessors had been the companion of immorality, now appeared as the advocate of virtue. Every grace was enlisted in the cause of a benign and beautiful piety. His style, too, is perfect after its fashion. There are many nobler and grander forms of expression in English literature than A.'s, but there are none comparable to it in sweetness, propriety and natural dignity. "Whoever wishes," says Dr. Johnson, "to attain an English style, familiar but not coarse, and elegant but not ostentatious, must give his days and nights to the volumes of A." His various writings, but especially his essays, fully realized the purpose which he constantly had in view, "to enliven morality with wit, and to temper wit with morality." They materially helped to reform the manners of their time, and created, in addition, that class of readers, which has now become so prodigious in numbers, and on which all literature now depends for its support—the middle class. It must, however, be admitted that since the beginning of the present c. their popularity has undergone a considerable decline. The chief cause of this is that much in them relates to temporary fashions, vices, rudenesses and absurdities which are now out of date. Yet, after making every abatement, it is certain that there are in the collected works of A. so many admirably written essays on subjects of abiding interest and importance, on characters, virtues, vices and manners, which will checker society while the human race endures, that a judicious selection can never fail to present indescribable charms to the man of taste, piety, philanthropy and refinement.

**AD'ELAAR**, CORD SIVERTSEN, one of the greatest naval commanders of the 17th c., was b. at Brevig, in Norway, in 1622, and in his 20th year was employed in the naval service of Venice against the Turks. On one occasion he broke through a line of 67 Turkish galleys which surrounded his ship, sunk 15, and burned several others. Frederick III., by the offer of the then unheard of salary of \$7200 per annum, engaged him as admiral of the Danish fleet; and, in 1675, under Christian V., he took the command of the whole of the Danish naval force against Sweden, but died suddenly at Copenhagen before the expedition set out.

**AD'ELAIDE**, the capital of the colony of South Australia, is situated on the Torrens, 7 m. from Port Adelaide, with which it is connected by railway. The first settlement was made in 1836, and the survey of the town lands was completed in 1837. The Torrens, which is spanned by several bridges, divides the town into North and South Adelaide. The streets of A. are broad and regularly laid out, especially in A. proper, to the s. of the river, where they all cross each other at right angles. Among the public buildings are the post-office, the government offices, the governor's house, and the town-hall. It is the seat of an Episcopal and of a Roman Catholic bishop, and has an unusual number of churches. A. also possesses a large botanical garden, covering more than 120 acres of ground. The t. is surrounded by a belt of permanently reserved land, half a mile in width, called the *park lands*, and beyond this are the suburbs. A. is abundantly supplied with water from two reservoirs 6 or 7 m. distant. The chief manufactures are woolen, leather, iron and earthenware goods. Its port (Port Adelaide) has a safe and commodious harbor. Pop. '71, 27,208; with the suburbs, about 70,000.

**AD'ELAIDE**, EUGÉNIE LOUISE, 1777-1847; princess of Orleans and sister of Louis Philippe. During the revolution she was in England, and on her return in 1792 found herself proscribed as an *émigrée*. She went to the Netherlands for the protection of her brother, but he was compelled to fly. In 1793 she rejoined him in Switzerland, accompanied by Madame de Genlis, her former governess, but having spent their money they took refuge in a convent. Ten years later she met her brother in Spain, and was with him until the restoration, using her influence to induce him to accept the crown. She died two months before his fall.

**AD'ELAIDE**, SAINT, b. about 933, d. 999; queen of Italy and empress of Germany, daughter of Rudolph II. of Burgundy. She was married to Lothaire II., son of Hugo, king of Italy; after Lothaire's death his successor imprisoned her because she would not marry his deformed son, but she escaped and was protected by Otho the great, who married her, and crowned her empress of the west in 962. During his reign she exercised much influence in Germany, and also over her son, who succeeded him, and over her grandson during his minority. She was called "the mother of kingdoms," and was regarded as a saint, though not in the calendar, her day being Dec. 16.

**AD'ELSEBERG**, a district and market t. in Carniola, in the vicinity of which is a large stalactite cavern called the *A. grotto*, through which flows a rapid stream. This cavern, the largest in Europe, is divided into the old and the new grotto: the former is 858 ft. in length; the latter, 8550 ft. in length, contains some most remarkable stalactites, among which is "the curtain" (*vorhang*), a white semi-transparent wall. The t. of A. is 22 m. n.e. of Trieste.

**AD'ELUNG**, FRIEDRICH VON, 1768-1843; a German philologist. He was tutor of the sons of emperor Alexander of Russia, Nicholas (afterwards czar), and Michael; also a councillor of state. He wrote *The Relations between the Sanscrit and the Russian Languages*, and *An Essay on the Sanscrit Literature and Language*.

**AD'ELUNG**, JOH. CHRISTOPH, a distinguished linguist and lexicographer, was b. 1732, in Pomerania, and d. 1806, at Dresden, where he had held the office of chief librarian. His chief works are his *Wörterbuch der Hochdeutschen Mundart* (dictionary of high German), in which he took Dr. Johnson as his model; and his *Mithridates oder allgemeine Sprachenkunde*, a work on general philology.

**AD'EN**, a peninsula and t. on the s.w. coast of Arabia. The most southern promontory of the peninsula, cape Aden, is in n. lat. 12° 47', and e. long. 45° 9'. This peninsula, the area of which is 18 to 20 sq. m., is doubtless of volcanic origin, and consists chiefly of a range of hills not exceeding 1776 ft. in height. It is joined to the mainland by a narrow, level and sandy isthmus. In a valley which forms the crater of a submarine volcano, stands the t. of A., which is also named from the neighboring promontory, Babel-Mandeb, or the gate of Mandeb. It was styled by the native Arabs Aden or Eden (paradise), on account of its fine climate and great commerce, for which it was celebrated from the oldest times. It enjoys almost perpetual sunshine; a cloudy day is of rare occurrence; the heat is pleasantly tempered by the sea-breezes; and the inhabitants are generally healthy. Pliny the elder seems to have known the native name of the place, for which he writes "Athana." It was also known by the name of "Emporium Romanum." Up to the time of the circumnavigation of Africa, A., so favorably situated at the entrance of the Red sea, was the chief mart of all Asiatic produce and manufactures, and even the Chinese traded here. Marco Polo and other voyagers of the middle ages told wonders of the riches and splendor of the place. In the course of time, however, it was reduced to a small village, which in 1838 contained only about 600

inhabitants, including some 250 Jews and about 50 Indian merchants. The Anglo-Indian government had long been on the outlook for a speedy route by steam from India to Europe. The explorations on the river Euphrates afforded no satisfactory results, and ultimately the old commercial route by the Red sea was chosen. This, of course, gave to the shores and harbors of that sea a new importance; and the English soon saw the advantages of a position like that of A. About this time, a British vessel suffered shipwreck off the coast of A., where the passengers were plundered and in other ways ill treated by the natives. A vessel was therefore dispatched from Bombay, in 1838, to compel the sultan of the country to make restitution, and also to learn on what terms the Arabs would be willing to cede A. to the English. Capt. Haynes, by fair promises, succeeded in gaining a cession of the country from the sultan, a weak and covetous old man. Afterwards, fearing the displeasure of some neighboring tribes, and partly moved by the suggestions of religious sheiks, the sultan repented of the transaction, but was held to his contract by force of arms; and on Jan. 11, 1839, after a few hours' contest, A. fell into the hands of the British. Here they have now a strong garrison and fortifications. In its medieval prosperity, A. had had a magnificent system of cisterns for collecting the rain-water from the circle of hills that surrounds it. Who built them is unknown; but it is conjectured that they had been begun about the 6th or 7th c. They had been allowed to fall into disuse, and were filled with rubbish, and in ruins; but recently a considerable number have been excavated and restored by the British government. If all restored, they seem capable of containing 30,000,000 gallons. A. is of great importance in a mercantile and nautical point of view, having a position between Asia and Africa like that of Gibraltar between Europe and Africa. The population and resources of the place have rapidly increased since 1838, and the opening of the Suez canal in 1869 gave it a great impetus. The value of its imports in 1871-72 was £1,404,169; and of its exports, £885,919. It has now a busy population of 30,000, gathered from every nation under heaven. Aden is a telegraphic station on the cable between Suez and Bombay, laid down in 1870.

**ADENITIS** and **ANGEIOLEUCITIS** are the terms employed in medicine to indicate inflammation of the lymphatic glands and inflammation of the lymphatic vessels respectively. In most instances of inflammation in the absorbent or lymphatic system, the vessels and glands are simultaneously involved. Although there is plenty of evidence, from the examination of the dead body, that inflammation of the lymphatics may occur internally, it is only observed in the living subject in connection with the skin or an ulcerated surface. The disease usually originates in an open wound of almost any form, as a puncture, a cut, or a blister. This wound is directly infected by some morbid matter, as, for example, some local inflammatory product, such as the putrid secretion of a sore; but more commonly by some irritating or poisonous matter from without, or some gaseous matter. The inflammation that is thus set up in the lymphatics always extends upwards from the wound, and may be traced by lines of redness following the course of these vessels, and not of the veins, and terminating where the inflamed vessels enter a gland. In the arm, for example, they never pass the armpit, in which the axillary glands lie. The tenderness along these inflamed tracts is excessive, and extends to the next gland, which appears to arrest the further progress of the poisoned lymph, by becoming itself inflamed. The degree of inflammation of the gland may vary from slight enlargement with tenderness on pressure, to profuse suppuration. The suppuration may not take place till a week or more after the inflammation of the vessels has subsided, and may excite no rigors or other constitutional symptoms; and a patient may be quite unconscious that there is anything serious the matter with him, when half a pint or more of matter may be collecting in and around a gland in the armpit. The constitutional symptoms attending an attack of acute inflammation of the lymphatic vessels (*angeioleucitis*) are often severe, and are thus summed up by Mr. Moore in his essay "On Diseases of the Absorbent System" in Holmes's *System of Surgery*: "Rigors, nausea and vomiting, heat of skin, thirst, dryness and coating of the tongue, with constipation, sleeplessness, and a feeling of languor, are usually the severest accompaniments of the disease. If the fever be typhoid, if there be profuse fetid sweats, severe muscular pains, high excitement, or dry burning heat of the skin, and marked delirium, the poison is no longer limited within the lymphatic channels, but has infiltrated the cellular tissues, and has tainted the blood. As the inflammation subsides, a cutaneous eruption or fetid discharge from the bowels comes on, and the general symptoms become those of exhaustion."

The following observations on the treatment of inflamed absorbents are mainly taken from Mr. Moore's essay. Many of the ordinary duties of life perpetually expose manual laborers and others to this painful affection. In the way of prevention, the practice of smearing the hands with oil or grease before touching noxious fluids, is found to prevent the mischief which might arise from absorption by a cut or sore, and is a useful precaution in dissection and in post-mortem examinations; and there can be no doubt that the timely application of a layer of collodion or of court-plaster might avert many attacks of inflamed absorbents. When symptoms of this form of inflammation supervene, the wound should be thoroughly cleansed, by being laid more open, if all its parts are not freely exposed, and then put under a stream of water, syringed, or soaked in a hot bath, as may seem most suitable. If recent or punctured, it should be sucked, and then freely

touched with a pencil of nitrate of silver. If flabby, it should be treated with a stimulating lotion of sulphate of zinc or of copper; if fetid, it should be wrapped in a solution of Condy's fluid, or in chlorinated lotions; and if sloughy it should be covered with Peruvian balsam and a poultice of linseed meal, charcoal, or yeast. A warm poultice of one of these kinds, frequently changed, is usually the most soothing application. At the same time, nitrate of silver should be two or three times drawn along the red tender lines indicating the course of the lymphatics, after which the arm should be enveloped in cotton-wool; and perfect rest in a comfortable position enjoined. Due attention must at the same time be paid to the general condition of the system, and especially to the condition of the intestinal secretions.

**ADENOCELE** (Gr. *adēnē*, a gland, and *kēlē*, a tumor) is the term now employed in surgery to indicate a kind of new growth in the female breast, the tissue of which closely resembles the breast-tissue itself. It is synonymous with the terms "chronic mammary tumor," "pancreatic sarcoma," "mammary glandular tumor," "hydatid disease of the breast," "serocystic sarcoma," etc. The diversity of names indicates the diversity of the outward forms seen in these growths. A full account of these tumors, and of the treatment to be adopted (which consists in excision), is given in Mr. Birkett's article "On Diseases of the Breast," in Holmes's *System of Surgery*.

**ADERNO** (ancient *Adranum*), a t. of Sicily, 17 m. n.w. from Catania. It is situated at the base of Mt. Etna, close to the Simeto, on which are some remarkable cascades near the town. It is surrounded by walls, is a very clean town, and is full of convents and nunneries, mostly founded by the Normans, so that bare walls of lava and grated windowes appear everywhere, and the sound of bells is almost incessantly heard. Pop. 14,600.

**ADERSBACH ROCKS**, a remarkable labyrinthine group of sandstone rocks situated near the village of Adersbach, in Bohemia. The aspect of some parts of the group has been compared to that of a city ruined by a conflagration. One of the pinnacles rises to a height of 218 ft. The structure of the rocks has been produced, not by any commotion of the earth, but by the influences of rain, frost, and other atmospheric changes, wearing down the soft sandstone into many fantastic forms. During the thirty years' war, the miserable people of Bohemia often found refuge in this locality.

**ADESTE FIDELIS**, known as the "Portuguese Hymn," because the duke of Leeds, who first heard it in the Portuguese chapel, mistook it for a portion of the service. It was composed by the author of "Dulce Domum."

**ADET**, PIERRE AUGUSTE, 1763-1832; a French politician and chemist. He was sent in 1795 as minister to the U.S., where he presented a tricolored flag to congress on behalf of the French nation. He also delivered the decree in which France complained that the U.S. treaty with England had violated neutrality, after which he published a flaming manifesto to the people and went back, or was recalled, to France, where, in 1809, he was a member of the deputies. He published *Elements of Chemistry*.

**ADHESION** is the species of attraction that is manifested between two separate bodies when their surfaces are brought to a considerable extent into close contact. It is nearly allied to cohesion (q.v.). A. is seen in the case of two solid bodies when their polished surfaces are laid on one another; but it acts more powerfully between solids and fluids, owing to their intimate contact. We have instances of this in the film of water adhering to any body dipped in that fluid, and in water running down the side of an inclined vessel from which it is being poured. All solids and liquids do not exhibit this mutual attraction. Thus, though bright metals are wetted by mercury, glass and wood are not; nor does water adhere to fat. Capillary attraction (q.v.) is a special manifestation of A. —The A. of gases to the surface of solids is described by Liebig as playing an important part in many processes. A more or less condensed atmosphere of gases surrounds every body, and every particle of a powdered or porous body; and gases, such as oxygen, have in this condition an intensified chemical action. Platinum in the state of powder condenses 800 times its volume of oxygen; and when hydrogen comes in contact with the oxygen in this state, the two gases combine, though, when free, they require the application of flame before they will combine.

**ADHESION**, in pathology, is when two surfaces of a living body become united. If they have been separated by the cut of a sharp instrument, and are immediately and accurately placed in apposition to each other, they may adhere at once without any apparent bond of union. But, generally, the blood-vessels of the part pour out, between the surfaces, a fluid, consisting of the watery part of the blood holding fibrine in solution. The liquid part of this is reabsorbed or escapes from the wound, leaving the fibrine, in which first cells are developed, and then blood-vessels: it is now a living tissue, and forms a uniting medium between the sides of the wound.

Serous membranes, as the pleura, pour out this fluid when inflamed; and hence the adhesions so often the result of pleurisies.—If two granulating (see **GRANULATIONS**) surfaces be kept in contact, the opposite granulations may fuse together, and the wound unite by secondary adhesion.

**ADHESION** (*ante*), in botany, the union of parts in a plant which are separate in other plants, or in the younger states of the same plant. What we are accustomed to consider parts of different nature only seem so in consequence of the way in which A. occurs. A leaf is said to be stem-clasping when its base partially surrounds the stem; while a stem which seems to pierce through the leaf is said to be perfoliate; but they differ only in this, that in the former the lobes at the base of the leaf embrace the stem without adhering, while in the latter they not only clasp the stem, but grow together where their margins come in contact. The leaves of the pitcher plant, formerly thought to be special organs without analogy, are known to be leaves so rolled up that their margins have touched and adhered. Other leaves, growing from opposite sides of the stem, adhere because their bases are connate, as in the honeysuckle; and yet others grow in a whorl, or all round a stem upon the same plane, and adhere at their margins, forming a sheath in the calyx. All the sepals are often distinct, as in the buttercup; but they also often adhere by their edge and form a cup, as in the cherry. In the corolla the petals are either all separate, as in the rose, or adhere by their edges, as in heaths. In the rose, the stamens are all distinct from each other; in the geranium they slightly adhere at the base; in the mallow they adhere in a partial tube; in other plants they grow into a complete tube. Certain parts of the pistil are called carpels, each of which is a hollow body terminated by a stigma. These carpels are hollow, because they are formed of a flat organ doubled up so that its edges come in contact and adhere. Sometimes only one carpel is present, as in the cherry; sometimes several, as in the rose. In the nicella the styles of the carpels are all distinct; in the lily and the myrtle the styles adhere so completely that there seems to be but one. In the apple the calyx seems to grow from the top of the fruit. This is because the carpels adhere to the inside of the calyx, which grows with the fruit, and leaves its extremities in a withered state near the top of the carpels. In the cherry no A. takes place between the carpels and the calyx; and, consequently, when the fruit is ripe there is no trace of the calyx upon the upper end of the drupe. In the raspberry the fruit slips like a thimble from the receptacle, because the carpels all adhere by their sides.

**ADIAN'TUM.** See MAIDENHAIR.

**ADIAPHORITES**, the name given to Melancthon and those who agreed with him in submitting, in things indifferent, to an imperial edict. When, in 1548, Charles V. issued an edict called the interim, relating to disputed religious doctrines, the Protestants became involved in a controversy in which this name originated.

**ADIGE**, after the Po, the most important river in Italy, rises in the Rhaetian Alps. Various streamlets descend from these mountains, and, uniting at Glarus, form the Etsch, which is, properly speaking, the beginning of the A., and the name by which the entire river is known in Germany. From Glarus it flows e. into the Tyrol; then, after a slight *détour* to the s.e., it flows due s., past Trent and Roveredo, into Lombardy, and, passing Verona, takes a s.e. sweep, discharging its waters into the Adriatic, between the mouths of the Po and the Brenta. In ancient times (when it was called the *Atthesis*), it had a more northerly *embouchure*. It is very rapid, and subject to sudden swellings and overflows, which cause great damage to the surrounding country. The two most remarkable inundations on record are those which occurred in 1721 and 1724. During the Italian wars its banks were repeatedly the scenes of bloody engagements. Its length is about 250 m.; its breadth in the plain of Lombardy, 650 ft.; its depth, from 10 to 16 ft. It is navigable as far as Trent, but the navigation is rendered extremely arduous, on account of the swiftness of the current. The A. is a transit river for the trade of Germany and Italy.

**A DIPIC ACID** ( $C_{12}H_8O_6, 2H_2O$ ) is a dibasic acid of the oxalic series, having the general formula  $C_{12}H_8O_6$ ; and is obtained in the form of white, opaque, hemispherical nodules (which are probably aggregations of small crystals), by the oxidizing action of nitric acid on oleic acid, suet, spermaceti, and other fatty bodies. The name is derived from the Latin *adeps*, fat, and must not be confounded with that of a similar acid of the same group, known as *sebacic acid*.

**ADIPOCERE** (Lat. *adeps*, fat, and *cera*, wax), a substance resembling a mixture of fat and wax, and resulting from the decomposition of animal bodies in moist places or under water. Human bodies have been found, on disinterment, reduced to this state. Lean beef kept under running water for three weeks, was found reduced to a fatty substance. A piece of a liver that has suffered what is called fatty degeneration, if immersed for some time in water, is said to become exactly like adipocere.

**ADIPOSE SUBSTANCES** are fatty matters—stearine, margarine and oleine being the most notable—present in some degree in most animal and in some vegetable organisms. They consist of carbon, hydrogen and oxygen, combined in varied proportions; they crystallize at low and are fluid at high temperatures: are combustible; are insoluble in water, but soluble in each other, in ether, alcohol, naphtha, bisulphide of carbon, etc. They differ in their atomic construction, and in the temperatures at which they solidify; pure stearine is solid at 140° F., while oleine is fluid to near the freezing point of water. Stearine is most abundant in hard fats, as tallow; oleine in the more fluid fats or oils. These substances, combined with glycerine (q.v.), exist in adipose tissue, microscopic in the cells of the liver and of some cartilages, in the substance of the brain and nerves, in marrow, in chyle, milk, and the yolk of eggs. A healthy appetite craves a certain

amount of fat-producing food, furnished either by the animal tissues which contain it, or from vegetable sources, as nuts, olives, Indian corn, and other seeds. The larger proportion of fats is formed in the processes of digestion from the starch and sugar of the food consumed by men and animals.

ADIPOSE TISSUE,  
magnified.

**ADIPOSE TISSUE** is a peculiar kind of animal membrane or tissue, consisting of an aggregation of minute spherical pouches or vesicles filled with fat or oil. The tissue itself is organic and vital, the vesicles secreting the fatty matter from the capillary blood-vessels with which they are surrounded; the secreted product, or fat (q.v.), is inorganic, and devoid of vitality. The A. T. differs from cellular or filamentous tissue in having the vesicles closed, so that the fat does not escape even when fluid. A dropsical effusion, which infiltrates the filamentous tissues, does not affect the A. T. There is a considerable layer of A. T. immediately under the skin; also around the large vessels and nerves, in the omentum and mesentery, around the kidneys, joints, etc.

**ADIRONDACKS**, a cluster of mountains in northern N. Y., terminating in the Catskills. The largest number and the highest peaks are in Essex co. Mt. Marcy, 5337 ft., is exceeded in this part of the country only by Mt. Washington. The A. cover about  $2\frac{1}{2}^{\circ}$  of lat. and  $1\frac{1}{2}^{\circ}$  of long., the general direction being from n.e. to s.s.w. The peaks are conical, the slopes abrupt, and the scenery is wild and grand. The rivers Saranac and Ausable flow from them, n.e., and the Hudson, Cedar and Boreas to the s. In the tract are many ponds and lakes; Racquette lake, very irregular in outline, being the largest. Some of these lakes are 1700 ft. above sea level. The A. region once abounded in caribou, moose, deer, bear, panther, beaver, otter, and smaller game, and is now famous for salmon, trout, pike, and other game fish. Caribou are gone, and moose nearly so, but it is still a favorite hunting country. Of late years the A. region has been a popular summer resort for those who desire life in camp, or wild scenery. There is little agriculture, but a large business in lumber, white pine being the most important. Magnetic iron ore has been worked, but abandoned because of the cost of transportation to market. A favorite route to the A. is by the Adirondack railway from Saratoga, connecting with stages to Blue Mountain lake, from which, through various lakes and outlets, the region may be traversed by boats. Other favorite approaches are from lake Champlain on the e., and from the St. Lawrence river on the n.

**ADIT**, a nearly horizontal passage opened for the purpose of draining a mine; it serves incidentally to explore the rock through which it passes; when filled with water, often used as a canal by which the products of the mine may be transported. Water raised from a depth greater than that reached by the A. is discharged through it, saving the cost of raising still farther to the top of the shaft. An A. opens in Cornwall at the level of the sea, and extends inland about 30 m., draining the district of Gwennap. It meets some shafts at the depth of 400 ft. The "Ernest August" adit in the Hartz, completed in 1864, is 13 m. long. The Joseph II. A. at Schemnitz, in Hungary, is 13 ft. high, 10 ft. wide, extends 12 m. to the valley of the Gran, and is used as a canal and a railway.

**ADJECTIVE** is the name of one of the classes into which grammarians have divided words. An A. is so called, not so much from its *being added* to a substantive, as because it *adds* to the meaning, or more exactly describes the object, than the simple substantive or general name does. The effect of an A. is also to limit the application of the name to which it is joined. Thus, when *tall* is joined to *man*, there is more meaning conveyed; there are more properties suggested to the mind by the compound name *tall man*, than by the simple name *man*; but *tall man* is not applicable to so many individuals as *man*, for all men that are not tall are excluded.—Nouns, or names of things, are often used in English as adjectives; thus, we say a *silver chain*, a *stone wall*. In such expressions as "income-tax assessment bill," *income* plays the part of an A. to *tax*, which is, in the first place, a noun; the two together then form a sort of compound A. to *assessment*; and the three, taken together, a still more compound A. to *bill*, which, syntactically, is the only noun in the expression. This usage seems peculiar to English.—Languages differ much in their way of using adjectives. In English, the usual place of the A. is before the noun. This is also the case in German; but in French and Italian it comes after. In these languages, again, the A. is varied for gender, number, and in the German for case. In English it is invariable; and in this simplicity there is a decided superiority; for in modern languages these changes in the A. serve no purpose. The only modification the English A. is capable of is for degrees of comparison.

**ADJUDICATION** is a technical term used in the practice both of the English and Scotch law, but with a totally different meaning in the two systems. In the law of England, the term A. is commonly used to denote the judicial determination at a certain stage of the proceedings in bankruptcy. The procedure is regulated by 32 and 33 Vict. c. 71. The petition prays that the trader may be adjudicated a bankrupt, and, after proof of the petitioning creditor's debt, and of the act of bankruptcy (q.v.), which must have been committed within twelve months before the issuing of the fiat, an A. is made by the

court that the party is bankrupt. Formerly, a trader might be adjudicated bankrupt summarily, and without previous petition for A.—namely, where, after filing a petition for arrangement with his creditors, he appeared not entitled to the benefit of the arrangement. See **BANKRUPTCY**. In *insolvency*, which differs from bankruptcy in this respect, that it is not confined in its operation to traders, or to any particular class of men, but applies to the community at large, the A. is made by the debtor delivering into the London bankruptcy court, if the debtor resides or carries on business within the district of that court, or in the bankruptcy court of the district within which he resides or carries on business, a declaration admitting his inability to pay his debts, which may be used as the ground of an A. by his creditors, if the court think it requisite; or if the creditors neglect to pass a resolution for liquidation or composition, or resolve in favor of bankruptcy; or if, after the passing of a resolution for liquidation or composition, the court shall for some sufficient cause adjudge the debtor bankrupt. This A. authorizes the discharge of the prisoner from custody as to all debts and sums of money due or claimed to be due to his several creditors. See **INSOLVENCY**.

The distinction between bankruptcy and insolvency has for some time been generally disapproved in England; and it may now be held as practically abolished. The insolvent debtors court is abolished, and its jurisdiction transferred to the bankruptcy court. Insolvent persons can now be adjudged bankrupts in every case in which their creditors wish that, or the court think it proper.

In the law of Scotland, A. signifies a process by which creditors may attach heritable or real property of their debtors. It applies to real estate in its most extensive signification, including not only feudal rights, but all rights or interests affecting or connected with land, such as bonds and mortgages, as also annuities, and all rights "having a tract of future time," life-interests, reversions, rights of lease, offices of dignity or jurisdiction, personal rights to lands, a certain class of personal bonds, rights of patronage, stock of any chartered bank, with, where the process of arrestment (the process, in the Scotch law, for attaching personal estate; see **ARRESTMENT**) is excluded, the husband's right in his wife's real estate, fair, harbor and ferry duties, entailed estates during the life of the heir, and the like.

The arrangements for the equitable administration of this law are regulated by various orders of the Scotch courts and by different statutes.

There are various other forms of the A. in the Scotch law, one of the most important and useful of which is called the A.-in-implemēt, a form of legal proceeding devised for the completion of defective titles to landed property.

**ADJUSTMENT**, in the law of insurance, is the ascertaining the exact amount of indemnity which the party insured is entitled to receive under the policy, and fixing the proportion of the loss to be borne by each underwriter. The nature and amount of damage being ascertained, an indorsement is made on the back of the policy, declaring the proportion of loss falling on each underwriter; and on this indorsement being signed by the latter, the loss is said to have been adjusted. After an A. has been made, it is usual for the underwriter at once to pay the loss. As a question of law, however, it does not appear to have been decided how far the A. is conclusive and binding upon the underwriters. In the opinion of some mercantile lawyers, the A. is merely presumptive evidence against an insurer, and it is, notwithstanding, open to the underwriter to show facts which, if proved, would have the effect of relieving him from liability.

**ADJUTANT**, *Ciconia argala*, a bird closely allied to the stork, made by some naturalists the type of a separate genus, *argala*. Adjutant is the popular name given to it by the English in India—*argala* the native name. It is a native of the warmer parts of India. It is of large size, and has very long legs; in its erect attitude, it is about 5 ft. high; its extended wings measure 14 or 15 ft. from tip to tip; its head and neck are nearly bare; a sausage-like pouch hangs from the under part of the neck; the bill is of enormous size. It is very voracious, swallows a cat or a leg of mutton quite readily, and is of great use in devouring snakes, lizards, and all sorts of offal. It sometimes catches birds upon the wing. The beautiful marabou feathers are obtained from the under side of the wings of this bird, and of another very similar species which inhabits Senegal.

**ADJUTANT**, as the derivation of the word implies (*adjutare*, to help), is the title of an officer who assists the commanding officer of a garrison or regiment in all the details of duty. He receives orders, and promulgates them to the several companies; he inspects escorts and guards before proceeding on their duty; attends to the drill of recruits, is accountable for the keeping of the regimental books, and ought to note every infraction of established rules. An *adjutant-general* performs analogous duties for the general of an army. He keeps an account of the strength of each regiment, distributes the orders of the day to the brigade-majors, and sees the troops drawn up for action. The *adjutant-general of the forces* is an officer of high rank at the Horse-Guards. To him all communications are addressed regarding leave of absence, discharging, recruiting, etc. Besides the adjutant-general at the Horse-Guards, there are deputy and assistant adjutants-general for special military districts.

**ADJUTANT-GENERAL**, in the U. S. army, an officer charged with recruiting and other service, of the rank of brig.-gen. He has about 20 assistants of various rank. The main duties of his office are to publish orders, write out and issue instruc-

tions, receive and care for returns, keep account of the state of the army and the position of forces, regulate details of the service, carry on correspondence, preserve order; and in active war to establish camps, supervise hospitals, muster and inspect troops, form parades and line of battle, and care for prisoners and deserters.

**ADJYGURH**, a t. of British India, in the n.w. provinces, province of Allahabad, 69 m. w.n.w. from Rewah. It has a fortress, situated on a very steep hill, and accessible only by well-defended paths. The hill, which is of granite, is isolated, and separated from the n.w. edge of a plateau by a very deep and impassable ravine. Within the walls of the fort are two great masses of ruins of temples, resembling in architectural character those of Southern India, and covered with the most elaborate sculptures. A. was for a short time the capital of a small Mahratta state, was taken by the British under lieut.-col. Martindell, in 1809, after an obstinate resistance, and restored to its previous possessors, who were Rajpûts. The native line of rajahs became extinct in 1855. Except the summit of the hill, occupied by the fort, which is healthy, A. is very subject to malaria. The fort is 860 ft. above the town, which is 480 ft. above the sea. Pop. about 5000.

**AD LA'TUS**, a person who assists an official, such as interpreter for an ambassador who does not speak the language of a court. Sometimes, as in Austria, general officers act *ad latius* to corps or provincial commanders.

**ADLER**, GEORGE J., PH.D., 1821-68; a native of Germany. He came to the U. S. when 12 years old, and was professor of German in the N. Y. university from 1846 to 1854, and a teacher and writer of books of education for some years later. Among his works are a German grammar, a reader and a dictionary of English and German, a Latin grammar, and various translations. His *Letters of a Lunatic* appeared but a short time before he became an inmate of the asylum for the insane, in which he died.

**ADLERBERG**, VLADIMIR FEDOROVITCH, Count; b. 1793; a Russian statesman. In 1817 he was adjutant to the grand duke Nicholas, and later his especial companion; in 1852 he was minister of the court, in constant attendance on the emperor, and kept the position under Alexander II., retiring in 1899 on account of old age. He was postmaster-general, and was the author of many reforms in the service.

**ADLERBERG II.**, ALEXANDER, Count, eldest son of Vladimir Fedorovitch, succeeding the latter as minister of the court. He was a school-mate of the emperor and inseparable from him, accompanying him in his visits to Germany and the Caucasus, in 1871.

**ADLERBERG III.**, NICHOLAS, brother of Alexander; adjutant-general of the emperor of Russia. He was governor-general of Finland, and author of *From Rome to Jerusalem*, an account of his travels in the Holy Land.

**ADLERCREUTZ**, KARL JOHANN, Count, 1757-1815; a Swedish general in the Finnish-Russian war in 1808, and one of the leaders who arrested Gustavus IV. in his palace. He was made lieut.-gen. in 1809, and count in 1814.

**ADLERSPARRE**, GEORG, Count, 1760-1835; a confidant of Gustavus III. of Sweden. He was in the campaign against the Russians in 1809, and one of those who arrested Gustavus IV., for which he received the public thanks of the diet and was promoted to high dignity. In 1831 he was fined for publishing secret state papers, and private correspondence with princes.

**ADLERSPARRE**, KARL AUGUST, Count, 1810-62; eldest son of Georg, and author of poems and novels and historical works.

**AD LIB ITUM** (in Ital., *a piacere* or *a piacimento*) is a musical term which implies that the part so marked may be performed according to the taste of the performer, and not necessarily in strict time. When there is an accompaniment to the music thus marked, it must strictly follow the A. L. time of the principal performer. Sometimes the words, *colla parte*, meaning with the leading part, are written over the accompanying parts. A. L. also frequently means that a part for a particular instrument or instruments, in instrumental scores or pianoforte arrangements, may either be played or entirely left out, thus: "Overture arranged for the pianoforte as a duet, with *ad libitum* accompaniments for the violin, flute, or violoncello."

**ADMETUS**, a mythical king of Phœæ, in Thessaly, succeeding his father, Phœæ. He was in the Calydonian hunt and the Argonautic expedition; Apollo was his herdsman for a year while banished from Olympus. He was husband of Alcestis, daughter of Pelias, and got exemption from death on condition that his father, mother or wife would voluntarily die in his stead: this Alcestis offered to do, but Hercules rescued her from Pluto and restored her to Admetus.

**ADMINISTRATION**, in politics, in its widest sense, is equivalent to the executive government of a state, as distinguished from its permanent constitution, and embraces not only the political ministry, but all the offices of judicature, etc. In a more restricted sense, as used in England, it designates the privy council (q.v.), and more especially that select committee of it known as the cabinet or ministry (q.v.).

**ADMINISTRATION** (*ante*), in American politics a general term for the federal or a state executive government. We speak of Washington's A., meaning the federal executive government during the time in which he was president; and of the policy, acts, omissions, errors, etc., of the A. of the nation or of any state. The supporters of the officials at the time in power are called the A. party. The "cabinet" is sometimes used as synonymous with the federal administration.

**ADMINISTRATION** and **ADMINISTRATOR**. An administrator, in the law of England, is the person to whom, in default of an executor named in the will, the ordinary or bishop of the diocese commits the administration or distribution of the estate of a person dying intestate.

**ADMINISTRATION OF CHARITIES** falls in the last resort to the sovereign as *parens patriæ*; and in the case of any charity being dilapidated or abused, the attorney-general will file an information in the court of chancery. The A. of C. is now, however, chiefly regulated by 16 and 17 Vict. c. 137, by which the crown is empowered to appoint commissioners and inspectors for the purpose. The act contains a reservation of the rights of the church of England; and it does not extend to the universities, or to such charities as are partially dependent on voluntary contributions. Charities for Roman Catholic purposes were also excluded from its operation for two years, and this term has been extended by subsequent enactments.

**ADMINISTRATOR-IN-LAW**. In the Scotch law, a father is A.-in-L. for his children, and, as such, is their guardian during minority. This power in the father ceases by the child's discontinuing to reside with him, unless he continues to live at the father's expense; and in the case of daughters, it ceases on their marriage.

**ADMIRAL**, the title of the highest rank of naval officers. The word is generally supposed to have been derived from the Arabic *emir* or *amir*, a lord or chief (*amir-al-mu'minin*, "commander of the faithful;" *amir-al-umra*, "commander of the forces"). Thus the early English form was *amiral* or *ammiral* (occurring once in *Par. Lost*); and so it is still preserved in French. In Spanish the word is *admirante* or *almirante*; in Italian, *ammiraglio*. The term seems to have been introduced into Europe during the crusades, and to have been first used in a definite sense by the Sicilians, and afterwards by the Genoese. About the end of the 13th c. it came into use in France and England. The first English admiral of the seas (*amiral de la mer du roy d'Angleterre*) of whom there is record was William de Leybourne, 1286. His office, however, was not that of a commander, but embraced these general and extensive powers afterwards associated with the title of lord high admiral of England; that is, both the administrative functions now vested in the *lords commissioners of the admiralty* (five in number), and the judicial authority belonging to the present high court of admiralty. The office of lord high admiral was last filled by the duke of Clarence, afterwards William IV. It had previously been in commission from 1708 to 1827. On his resignation in 1828, the office was again put in commission. See ADMIRALTY, COURT OF.

In the British navy the admirals are distinguished into three classes: Admirals, vice-admirals, and rear-admirals; the admiral carrying his colors at the main, the vice-admiral at the fore, and the rear-admiral at the mizzen mast-head. In former times, each grade was subdivided into three sections, known as admirals (or vice or rear admirals) of the red, of the white, and of the blue, respectively. The flag hoisted by the admiral (thence called a flag-officer) agreed in color with his section; and all the ships under his command carried ensign and pendant of the same hue; but the distinction was otherwise without practical effect, and is now abolished. *Admiral of the fleet* is a higher rank, conferred at the will of the sovereign. The rates of full or sea pay of flag-officers are as follows: Admiral of the fleet, per day, £6; admiral, £5; vice admiral, £4; rear-admiral, £3. An admiral commanding-in-chief receives £3 a day additional at home, and £4 10s. abroad as table-money. In 1878 there were 65 flag-officers in the British navy: viz., 3 admirals of the fleet, 16 admirals, 16 vice-admirals, and 30 rear-admirals. In the same year, the number of flag-officers retired and on reserve half-pay was upwards of 150. The admiral of the fleet takes rank with a field-marshal, admirals with generals, vice-admirals with lieutenant-generals, and rear-admirals with major-generals.

**ADMIRAL** (*ante*). In the U. S. navy this office was created by degrees; rear-admiral in 1862, in compliment to Farragut for heroism; vice-admiral in 1864 for the same man; and admiral July 25, 1866, also for him. A. is equivalent in rank to general of the army; vice-admiral to lieutenant-general, and rear-admiral to major-general. The pay of admiral is \$13,000 a year, of vice-admiral \$9,000, and of rear-admiral \$6,000.

**ADMIRALTY COURT**. This court—whose functions are now exercised by the probate, divorce and admiralty division of the high court of justice, constituted in 1873-5—was created to try and decide maritime causes. Formerly, the maritime courts of England were divided into the *instance court* and the *prize court*—separate tribunals, though usually presided over by the same judge. In the prize court, the judge's authority to hear and decide questions as to prizes of war was under a special and separate commission, issued at the commencement of each war; and the court itself existed only during the war, or until the litigations to which it had given rise were brought to a conclusion. In this respect it differed from the instance court, which

was a permanent institution. The jurisdiction in question of booty of war, and the distribution thereof, has now, however, been conferred on the A. C. itself, and the prize court and its jurisdiction and practice were regulated by 27 and 28 Vict. c. 25. By another statute, jurisdiction relating to the attack and capture of pirates is vested in the A. C. in this country, and in the vice-A. courts abroad (13 and 14 Vict. c. 26, 27). Whilst there was a lord high admiral, the judge of the A. C. usually presided in virtue of a patent from him; but since the office has been intrusted to commissioners, the judge holds a direct commission from the crown under the great seal. By 3 and 4 Vict. c. 65, s. 1, the dean of the arches is authorized to sit for the judge of the A. C. in certain cases; and all barristers and solicitors were admitted in 1859 to practice in both courts. The proceedings of the A. C., like those in ecclesiastical courts, were originally based on the civil law, and upon this account it was usually held at doctors' commons. But it is merely as the basis of the earlier mercantile codes, such as the Rhodian laws and those of Oleron, and by no means exclusively, that the civil law is of authority in these courts. Questions of the utmost nicety in the law of nations fall to be decided by maritime courts in time of war; and it was as an A. judge that many of the most remarkable of lord Stowell's famous judgments were pronounced. The appeal from the A. C., which was originally to the king in chancery, and afterwards certain commissioners of appeals, consisting chiefly of the privy council, and not of judges delegated by that body, is now to the court of appeal created by the judicature act of 1873-5. The jurisdiction of the vice-A. courts in the colonies and foreign dominions of the queen has been extended and defined, and their procedure regulated by statutes of recent date. Appeals from these courts formerly lay to the A. C. in England, and were also competent to the queen in council; like those from the A. C. itself, they are now carried to the court of appeal, like all other matters. The civil jurisdiction of the A. courts was greatly extended by 3 and 4 Vict. c. 66, and later statutes to 27 and 28 Vict. c. 25. It now extends generally (and the county courts also exercise part of it) to disputes between part-owners of a ship, suits for mariners' and officers' wages, suits for pilotage, suits on bottomry and respondentia bonds, and relating to salvage, wreck, collision of ships, etc. County courts are expressly prohibited from entertaining questions of prize, questions arising under the act for the suppression of the slave-trade, or questions of A. jurisdiction by way of appeal. In criminal matters, the A. C. formerly took cognizance of piracy and other offenses on the sea, or on the coasts beyond the limits of any county, and, concurrently with the common-law courts, of certain felonies committed in the main stream of great rivers below the bridges. The criminal jurisdiction of the A. is regulated now by the criminal law consolidation acts generally. All offenses mentioned in those acts committed within the jurisdiction of the A. shall be dealt with, inquired of, tried and determined in any county or place in England or Ireland in which the offender shall be in custody, in the same manner in all respects as if they had been actually committed in that county or place. Since the passing of these enactments, the criminal jurisdiction of the A. C. may be regarded as obsolete. There is a separate court of A. in Ireland. The A. C. of Scotland has been abolished, and its ordinary jurisdiction transferred to the court of session, the court of justiciary and the sheriffs; questions of prizes, captures, condemnations, and the like, being vested exclusively in the high court of A. in England.

**ADMIRALTY DROITS** are a portion of the hereditary revenues of the crown, arising from enemies' ships detained in the prospect of a declaration of war, or coming into port in ignorance of the commencement of hostilities, or from such ships as are taken by non-commissioned captors, the proceeds of wrecks, the goods of pirates, and the like. The proceeds of the droits of A. are now paid into the exchequer for the public use.

**ADMIRALTY ISLAND** lies on the n.w. coast of N. America, between 57° 2' and 58° 24' lat. n., and 134° 52' and 135° 30' long. w. It is about 80 m. long, well wooded and watered. It is inhabited, and belongs to the U. S.

**ADMIRALTY ISLANDS**, a group of about 40 islands, to the n.e. of New Guinea, between 2° and 3° lat. s., and 146° 18' and 147° 46' long. e. They were discovered by the Dutch in 1616. The largest is about 50 m. long from e. to w. They abound in coconut trees, and are inhabited by a race of tawny frizzle-headed savages.

**ADMIRALTY JURISDICTION**, in American practice, extends, in criminal cases, to offenses committed beyond any national jurisdiction and on the high sea. In civil matters it includes salvage, bottomry, hypothecation, seizures under the laws of trade; navigation or customs; prizes, charters, certain contracts between different states or foreign ports, contracts for conveyances, maritime contributions, pilotage, ship surveys, and in general all cases of trespasses, damages, assaults, etc., on the seas. The district court of the U. S. in which the action is brought has original jurisdiction. There are no admiralty courts so named. Cases may be removed to the circuit and thence to the supreme court. A suit in a civil case is brought by filing a libel, upon which a warrant for arrest or attachment may issue; or there may be a simple notice to appear; or there may be process for the arrest and seizure of the articles. Thereafter stipulations may be made or bail taken. Testimony may be given orally, but in cases of importance it is usually written. No juries are called; the decree of the court ends the matter. In a

criminal prosecution under A. J. the proceedings are according to those at common law. With regard to jurisdiction, where a seizure has been made the court of that especial section has jurisdiction, though the act of seizing may have occurred in a different district. In seizures out of special jurisdiction, or on the high seas, the court where the goods, persons or things may be landed has jurisdiction. A district court has also jurisdiction over all torts and injuries committed at sea or within ebb and flow of the tide. In one instance A. J. was held and admitted in a case of collision that happened in an inland state on a river more than 200 m. from the ocean. Any court having A. J. has the power to redress personal wrong treatment of a passenger at sea by the master of a vessel. As a court of admiralty, the district court has, concurrent with common law courts, jurisdiction over maritime contracts without exception as to form or by whomsoever executed, such as charter parties for foreign transit, the wages of seamen, etc. To a certain extent all these matters of jurisdiction apply to our lakes and navigable rivers. Seamen in port, if on tide-water, engaged in commerce, are within A. J.; but hands on ferries are not. Persons actually employed in the navigating of a vessel, such as pilots, engineers, firemen or deckhands, may sue for wages under A. J.; but waiters, musicians, and those who have no part in navigation, cannot. Congress has provided for extraordinary jurisdiction in admiralty in cases of seizure under the navigation, trade or impost laws of the U. S.; but the act reserves to all sailors the common law remedy, where the common law is competent to furnish it. A. J. extends over captures within the waters of the U. S., or within a marine league of land; the civil jurisdiction extends to seizures on land under federal laws, and suits for penalties and forfeitures incurred under such laws. But in the hearing of seizures on land the court sits as at common law, with jurisdiction distinct from that in case of seizure on navigable waters; and these common law seizures may be tried by jury. Suits to the lower limit of \$100, instituted by the U. S. or an officer thereof, are within A. J. Under this provision the head of a department, as the postmaster general, may sue for money due the government. Lastly, actions by or against our consular representatives are embraced in A. J. By an act of 1842 the district (or admiralty) courts have concurrent jurisdiction with the circuit courts in crimes and offenses against the nation that are not liable to capital punishment.

ADOBE, sun-baked bricks, of fine sand and clay dust, made in the same manner as common bricks, but very smooth and hard. They are much used for building dwellings in Mexico and C. America. Adobe houses are generally of one story, warmer in winter and cooler in summer than wooden or stone buildings.

ADOLPHUS, or ADOLPH, of NASSAU, 1250-98; son of Walram, count of Nassau, He was the successor of Rudolph, count of Hapsburgh, supplanting the natural heir, and was crowned king of Germany, June 24, 1292. A. agreed for a large subsidy to assist England in her war with France, but failed to fulfill his part of the contract. For certain high-handed acts he was summoned before the college of electoral princes, refused to appear, and was formally deposed in June, 1298, when the crown was restored to Rudolph's son. Both took the field in person, and A. was killed in the first battle.

ADOLPHUS, FREDERICK, 1710-71; of the house of Vasa, and duke of Holstein-Gottorp. He was elected to the Swedish throne in 1743, but the royal authority was so circumscribed by the council of the states, or nobles, that he was only a nominal king. In 1769 he offered to resign, but, on some concessions by the nobles, was induced to retain the throne till his death, when his son Gustavus III. succeeded him.

ADOLPHUS, JOHN, 1766-1845; an English lawyer, celebrated in criminal practice. He gained much credit in the defense of Arthur Thistlewood, charged with treason in the Cato street conspiracy, in London, 1820. He was the author of a *History of England from the Accession of George III.*, and *Biographical Memoirs of the French Revolution*.

ADOLPHUS, JOHN LEYCESTER, son of Frederick, a barrister and author of a curious book, *Letters to Richard Heber, esq., containing Critical Remarks on the Series of Novels beginning with Waverley, and an Attempt to Ascertain their Author*, in which book he showed that no other than Walter Scott could have produced the novels in question.

AD'ONAI, signifying "lord," or "my lord," or "master;" a proper noun used by Hebrews where "Jehovah" occurs in their scriptures, the latter being deemed the holy name, and not to be openly pronounced. It is said that the true pronunciation of the Hebrew letters for Yahve, or Jehovah, is lost.

ADONIA, feasts in honor of Venus and Adonis. They lasted two days, one of lamentation, and one of mirth, typifying the death and resurrection of nature.

ADONIC VERSE, a dactyl and spondee, or dactyl and trochee, adapted to light, lively versification, as the famous hymn:

"Plaudite coeli;  
Rideat Æther," etc.

ADONIS, a mythical personage, whose beauty as a child so attracted the love of Venus and Proserpine, that they quarreled about the possession of him. Jupiter, appealed to, settled the dispute by deciding that A. should spend part of the year with Venus, and part with Proserpine, so that he lived eight months of the year in the upper world, and four in the under. A. was afterwards killed by a boar while hunting, and Venus, coming

too late to his rescue, changed his blood into flowers.—A yearly festival was celebrated in honor of A., and consisted of two parts—a mourning for his departure to the under world, and a rejoicing for his return to Venus. This festival, widely spread among the countries bordering on the Mediterranean, was celebrated with peculiar pomp at Alexandria. Connected therewith were the gardens of A., as they were called. Before the festival, wheat, fennel and lettuce were sown in earthen and even in silver pots, and forced by heat; intended to indicate, doubtless, by their brief bloom, the transitoriness of earthly joy. The myths connected with A. belong originally to the e. They display a worship of the powers of nature conjoined with that of the heavenly bodies, and A. himself appears to be the god of the solar year. The similarity of the name to the Phœnician *Adon*, which signified “lord,” is unmistakable; and this word Adon was specially applied to the king of heaven, the sun.—In reference to the brilliant beauty ascribed to A., a beautiful man is called “an Adonis.”

**ADONIS**, a genus of plants of the natural order *ranuncule* (q.v.), in which the flower has 5 sepals and 5 to 10 petals without scales at the base, and the fruit consists of awnless pericarps. The species are all herbaceous—some of them annual and some perennial. Several are natives of Europe, but only one, *A. autumnalis*, sometimes called pheasant's eye, is a doubtful native of Britain. Its bright scarlet petals have obtained for it the name of *flos Adonis*, their color having been fancifully ascribed to their being stained with the blood of Adonis. It is a well-known ornament of our gardens; in which also *A. aestivalis* frequently appears, and *A. vernalis*, a perennial species common upon the lower hills of the middle and s. of Germany, with early and beautiful flowers.

**ADOPTIAN CONTROVERSY**, The, was an echo of the Arian controversy, and originated about the end of the 8th c. in Spain, the country in which the doctrine of Arius had longest held out. Elipandus, archbishop of Toledo, and Felix, the learned bishop of Urgel, advanced the opinion that Christ, in respect of his divine nature, was doubtless by nature and generation the Son of God; but that as to his human nature, he must be considered as only declared and adopted through the divine grace to be the first-born Son of God (Rom. viii. 29), just as all holy men are to be adopted as sons of God, although in a less lofty sense. The flame of controversy thus kindled spread into the Frankish empire, the special domain of “Catholic” Christianity, and gave occasion to two synods, one held at Itatsbon (792), and another at Frankfort (794), in which Charlemagne took part in person, and which condemned Adoptianism as heresy. The Catholic doctrine of the unity of the two natures of Christ in one divine person and the consequent impossibility of there being a twofold Son—an original and an adopted—was upheld by Alcuin and the other learned men of Charlemagne's court. At a subsequent synod at Aix-la-Chapelle, Felix, yielding to compulsion, recanted his opinions, without, as it would seem, being convinced. Elipandus adhered fanatically to his views, which were, in after-times, defended by Folmar (1160), Duns Scotus (d. 1308), Durandus (d. 1322), the Jesuit Vasquez (1606), and the Protestant divine Calixtus (1643).

**ADOPTION** (Lat. *adoptio*); a legal institution of much importance in both of the classical nations of antiquity. A., in the strictest sense, in the Roman law, applied only to the case in which a person in the power of his father or grandfather was transferred to that of the person adopting him. Where the person adopted was already emancipated from the paternal power (*patria potestas*), and was regarded by the law as his own master (*sui juris*), the proceeding was called adrogation (*adrogatio*). A., however, was also used as a generic term comprehending the two species; and in Greece, where there was nothing corresponding to the paternal power of the Romans, this distinction did not obtain. At Athens the adopted child was transferred from his own family and parish or tribe (*demos*) into those of the adoptive father, whose property he inherited in the absence of legitimate children, and whose sacred rights he was bound to maintain. Only Athenian citizens could be adopted, so that not only the next of kin but the whole community were interested in preventing fraudulent adoptions. With this view, registration in the demus of the adoptive father was requisite, in order to entitle the son to the rights of citizenship as a member of it. In Rome the adopted child assumed the name and became bound to discharge the religious duties of the adoptive father, which usually consisted in sacrifices to the *penates* or other divinities. These observances were for the most part connected with the *gens* or tribe to which the individual and his family belonged; and Savigny has even denied the existence of *sacra* peculiar to the family. A. was effected under the authority of a magistrate, the prætor at Rome, or the governor (*prores*) in the provinces. Adrogation originally required a vote of the people in the *comitia curiata*; but under the emperors it became the practice to effect it by an imperial rescript. A patrician was sometimes adrogated into a plebeian family for political purposes. Clodius, the enemy of Cicero, was so adrogated, in order that he might be eligible to a tribuneship of the people. If a father having children in his power was adopted, both he and his children passed into the power of the adoptive father. It was requisite that the adoptive father should have no children at the time, and no reasonable prospect of having any. He was also required to be older than the person adopted. Females could not be adrogated, nor, from their not sharing in the paternal power, could they adopt in any form. An opposite rule has prevailed where the institution has been received in modern times. A. was unknown to the law of the Teutonic nations; and though most of

the states of the continent have borrowed it from the Roman law, it has never existed as an institution either in England or Scotland. The patrimonial benefits of A. may, however, be conferred by deed; and there is no illegality in any one assuming the name, arms, and other distinguishing characteristics, and corresponding responsibilities, of a person who does not belong to his family. In France A. is recognized only in a very modified form (*code civil*, art. 343, *et seq.*).

**ADORATION**, an act of homage or worship among the Romans, performed by raising the hand to the mouth, kissing it, and then waving it towards the adored object. Sometimes the devotee kissed the feet or knees of the images of the gods, and Saturn and Hercules were saluted with the head uncovered. It was natural to extend to great men the A. first paid only to the deities, and Greek and Roman emperors were adored by bowing or kneeling, touching the imperial robe, and kissing the hand that did so. Eastern A. was to fall on the knees at a prince's feet, striking the forehead on the ground, and kissing the earth or floor. Such A. was refused by Conon to Artaxerxes, and by Calisthenes to Alexander the great. In England kissing the queen's hand is a form of A. The kissing the foot or slipper of the pope is the form in Rome, an example set by the emperor Diocletian; but the Roman Catholic church makes a distinction between *latría*, a worship due to God alone, and *dulia* or *hyperdulia*, the A. paid to the virgin, saints or martyrs.

**ADORNA**, CATHERINE, or CATHERINE OF BOLOGNA, 1413-63; of noble descent. She was abbess of a convent in Bologna of the order of St. Clare, and was distinguished for her rapt and devout piety. It was claimed that she could prophesy and perform miracles, and a book of her *Revelations* was published in 1511. Her name is revered even among Protestants of the present day.

**ADORNO**, ANTONIO, doge of Genoa, elected 1384; d. 1397; three times driven out and as often re-established. It is said that he induced the Genoese to become subject to Charles VI. of France, but they did not remain so.

**ADOUR**, a river in France, rises near Tourmalet, in the department of the upper Pyrenees, waters in its course of 200 m. the department Gers and the fertile part of the department Landes, and enters the Atlantic below Bayonne. It receives several tributaries, and is navigable to the extent of 80 m. Bagnères-de-Bigorre, celebrated for its hot baths, is situated on the Adour.

**ADOWA**, a t. of Abyssinia, the capital of Tigré, 145 m. n.e. from Gondar. It is situated partly on a slope and partly at the base of a hill, on the left bank of the Hasam, a feeder of the Atbara, which is a large branch of the Nile. The houses are of the conical form common in Abyssinia, regularly disposed in streets, and mingled with gardens and trees. A. is the chief entrepôt of trade between the interior of Tigré and the coast. It has an extensive transit trade, in which gold, ivory and slaves are articles of importance. It has also manufactures of cotton fabrics, and iron and brass wares. Pop. estimated at about 8000.

**ADRA** (ancient *Abdera*), a sea-port t. of Spain, in the province of Granada, and 49 m. s.e. from Granada. It is situated on the shore of the Mediterranean, at the mouth of the Adra. The ancient Abdera, founded by the Phœnicians, was on a hill, at the base of which the modern t. stands, in a situation unhealthy on account of swamps. The port is not good, being much exposed to the w. The houses are generally of one story. There is one tolerably wide street, the rest are narrow and ill paved. From the watch-tower of A., in former times, a tocsin sounded the alarm on the approach of African pirates. Lead mines in the neighborhood give employment to many of the inhabitants and trade to the port. Among the other exports are grapes, wheat and sugar. Fishing and the distillation of brandy are carried on. Pop. 9000.

**ADRASTE'A**, "she whom none escapes," a goddess of retribution, like, or perhaps identical with, Nemesis.

**ADRAS'TUS**, a king of Argos, contemporary of Theseus, father-in-law of Polynices, and leader of an expedition against Thebes to restore Polynices to the throne. This was the "war of the seven against Thebes," and was not successful, all the seven save A. being killed. Ten years later Thebes was captured and destroyed, in which conflict A. lost his son, and soon afterwards died of grief.

**ADRIA**, in the province of Rovigo, N. Italy, is situated between the river Po and the Adige, contains about 15,000 inhabitants, and is chiefly remarkable as being one of the oldest cities in Europe. According to tradition it was founded by the Pelasgi, 1376 B.C. In the time of the Romans, A. was one of the most frequented harbors in the Adriatic sea; but by the continual deposition of alluvium on the e. coast of Italy, it has been gradually separated from the sea, from which it is now almost 10 m. distant. It still retains several interesting remains of Etruscan and Roman antiquity; but its wine, formerly so celebrated, is now deplorably bad.

**ADRIAN**, a city in Lenawee co., Mich., the co. seat, on the Raisin river and the Mich. Southern railroad. It is in a grain-raising region. There is good water power, and there are many factories; about a dozen churches and a Protestant Methodist college. Pop. 70,843. It is a thriving and pleasant city, having some importance as one of the points of repair and supply for the Mich. Southern railroad.

**ADRIAN**, Roman emperor. See **HADRIANUS**, *ante*.

**ADRIAN**, the name of six popes, none of them very remarkable. A. IV. was by birth an Englishman, the only one of that nation that ever sat in the papal chair. His name was Nicholas Brakspeare. He was a native of Langley, near St. Albans, became first a lay-brother or servant in the monastery of St. Rufus, near Avignon, and in 1137 was elected abbot. His zeal for strict discipline raised a combination to defame his character, and he had to appear before Eugenius III. at Rome. Here he not only cleared himself of all charges, but acquired the esteem of the pope, who appointed him cardinal-bishop of Albano in 1146. On the death of Anastasius in 1154, he was raised to the papal see. A. was at first on friendly terms with the emperor Frederic I.; but his high notions of the papal supremacy, which he carried as far as even Gregory VII., led to the beginning of that long contest of the popes against the house of Hohenstaufen, which ended in the destruction of the dynasty. He was about to excommunicate Frederic, when he died at Anagni, 1159. It was in A.'s time that the doctrine of transubstantiation (q.v.), advanced by Petrus Lombardus, was established.

**ADRIANOPOLE**, the second city in the Turkish empire, was founded by the emperor Hadrian on the left bank of the navigable river Hebrus (now Maritza). Here the sultans ruled from 1366 to 1453, when Constantinople was made the capital. The city has now about 90,000 inhabitants, the half of whom are Turks. Two palaces, 40 mosques, 24 public schools, 22 baths, and the numerous gardens laid out on the banks of the Maritza, may be named as the principal features of A. Its trade consists in opium, oil of roses, with silk and other manufactures.—The Russian-Turkish war was here concluded, Sept. 19, 1829, by the peace of A., which left the Porte in possession of Wallachia, Moldavia, and the conquests made by Russia in Bulgaria and Roumelia. On the other side, Russia got possession of the whole of the coast of the Black sea, from the mouth of the Kuban, in lat. 45° 15', to the haven of St. Nichola, lat. 42°, with the territories of the Caucasus and the greater part of the pashalic of Akalzik. After the capture of the Turkish army defending the Shipka Pass, in Jan., 1878, the Russians entered A. unopposed by the Turks.

**ADRIATIC SEA**, a large arm of the sea, extending, in a n.w. direction, between the e. coast of Italy and the w. coast of the opposite continent, being connected with the Ionian sea by the strait of Otranto. In the n. it forms the gulf of Venice, and in the n.e. the gulf of Trieste; while, on the Italian side, it forms the bays of Ravenna and Tremiti, and the narrower and deeper gulf of Manfredonia. On the other side, the coasts of Illyria, Croatia, Dalmatia and Albania are steep, rocky and barren, and begirt with a chain of almost innumerable small rocky islands. The chief bay in this side is that of Quarnero, lying s. of the peninsula of Istria. The most considerable rivers flowing into the A. S. are the Adige and the Po, which are continually depositing soil on the coast, so that places once on the shore are now inland. The extreme saltiness of the A. is probably owing to the comparatively small quantity of fresh water poured into it by rivers. Navigation in the A. is safe and pleasant in summer, but in winter the n.w. gales are formidable, on account of the rocky and dangerous coasts on the e. Trieste, Ancona and Sinigaglia are the chief places of commerce.

**ADULE**, an ancient t. on the Red sea, was the port of Axum, and is noted chiefly on account of an inscription, of some importance relative to the ancient geography of those regions, the *monumentum adulitanum*, first published, in the 6th c. in the *Topographia Christiana* of Cosmos Indicopleustes. The modern t. is called Zulla.

**ADULAMITES**. An attempt, in the year 1866, by the government of earl Russell and Mr. Gladstone, to carry a measure which would have brought about a sweeping reduction of the elective franchise, gave occasion to a large number of the more moderate liberals to secede from the whig leaders, and vote with the conservatives. The designation of *Adulamites* was fastened on the new party, in consequence of Mr. Bright having, in the course of debate, likened them to the political outlaws who took refuge with David in the cave of Adullam (1 Sam. xxii. 1, 2); a comparison taken up by lord Elcho, who humorously replied that the band congregated in the cave was hourly increasing, and would succeed in delivering the house from the tyranny of Saul (Mr. Gladstone) and his armor-bearer (Mr. Bright).

**ADULTERATION OF FOOD**, etc. The more important adulterations will be noticed under the various articles. See also **FOOD**.

**ADULTERY** (Lat. *adulterium*) has been well defined as "the voluntary sexual intercourse of a married person with a person other than the offender's husband or wife." (*Bishop on Marriage and Divorce*, § 415.) By the Roman law, there was no A. unless the woman was married, and the same was the rule in Athens. It was in this limited form also that A. was recognized by the Mosaic law. By the canon law, the husband and wife were placed on the same footing; and this view has been adopted by all the nations of modern Europe. In the American state of New Jersey, it has been decided that a married man does not commit this crime in having connection with an unmarried woman. (Bishop, *ibid.*) But such has not been the prevalent doctrine even in America; and it has never been doubted that the offense necessary to found the sentence of divorce is committed by unlawful sexual intercourse equally whether the *particeps criminis* were married or single. A. was recognized as a crime even before Moses (Gen.

xxxviii. 24), and it is probable that in affixing to it the punishment of death (Lev. xx. 10), he followed the prevailing custom. A very remarkable law was introduced for the trial of A. by causing the woman suspected to drink the bitter waters of jealousy (Numb. v. 26). In Rome, the Julian law, enacted in the time of Augustus (17 B.C.) revised the previous legislation on the subject, and imposed special penalties, consisting of forfeiture of goods and banishment, both on the adulteress and the paramour. The husband, in certain cases, was permitted to kill the latter, and the father might sometimes kill both. A constitution of Constantine, the authenticity of which has been doubted, made A. a capital offense on the man's part. Whatever Constantine's law was, it was confirmed by Justinian, who further condemned the wife to be whipped, and imprisoned in a convent for the rest of her days, unless relieved by her husband within two years (*Novel*, 124, c. 10). The offense was visited in Athens with punishments closely resembling those of the earlier Roman legislation. In many continental countries, A. is still treated as a criminal offence, but in none of them does the punishment now exceed imprisonment for a limited period, which is frequently accompanied with a fine. Lord Coke says that by the law of England in early times, A. was punished by fine and imprisonment (3 *Inst.* 306). During the Commonwealth, it was made a capital offense (*Scobell's Acts*, part ii., p. 121); but this law was not confirmed at the Restoration. In Scotland, the records of the court of judicatory show that capital punishment was frequently inflicted. At the present day it is punishable in Great Britain only by ecclesiastical censure; and even this may be regarded as in desuetude. But when committed by the wife, it was regarded as a civil injury, and, till the passing of the stat. 20 and 21 Vict. c. 85 and 59, formed the ground of an action of damages for criminal conversation (commonly known as an action of *crim. con.*) by the husband against the paramour. No corresponding action was competent to the wife, either in England or America; and her only remedy consisted in obtaining a separation or divorce. In Scotland, A. forms a ground for dissolution of the marriage, at the suit of the injured party. See SEPARATION, DIVORCE.

**ADULTERY** (*ante*). In some of the United States A. is made criminal by special law; in some it is not so recognized; in some the act itself is not a crime, but open and continued A. is. Some statutes define the crime; some only state the punishment; and this leaves a wide margin for interpretation by courts, giving rise to great diversity of opinions and decisions. Some hold that if one only of the parties be married, the other does not commit A.; some that a married man with a single woman does not commit A. because the act cannot impose spurious issue on a husband or wife. In Massachusetts, in case of a married woman and an unmarried man, the latter is deemed guilty. In New York, in such case the man does not commit A., his offense being, as in Virginia, only fornication. Connecticut and Iowa punish man and woman alike; but where no exact statute exists the general drift of opinion and decision is that a married person commits A., and an unmarried person only fornication; therefore criminal A. is the voluntary sexual intercourse of a married person with another person who is other than the proper husband or wife. Living together without marriage is hardly reckoned to be A., and seldom interfered with unless the parties are otherwise objectionable. In several states no criminal prosecution can be commenced for A. except on complaint of the husband or wife of the person charged with the offense.

**ADVANCEMENT**, in law, a gift by a parent to an heir, of all or a portion of that which he or she would be entitled to upon arriving at a certain age, or upon the death of the advancer. An A. is legal only from a parent to a child. Any such gift is presumptively an A., but the contrary may be shown. No regular form of an A. is needed. An A. has the effect of reducing by its amount the distributive portion that would come to the receiver.

**ADVANCEMENT OF SCIENCE**, ASSOCIATIONS FOR THE, well-known bodies of scientific men, especially in Great Britain and the United States. The English body was organized in 1831, under the lead of David Brewster, and in three years grew from 100 to 1400 members; its annual transactions form volumes of about 500 pp. each. The American association began in 1847 at Philadelphia, and was organized by geologists chiefly; but now embraces almost every prominent scientific man in the country. The association meets annually, changing its place from city to city. The doings and documents, except abstruse mathematical papers, are published yearly.

**ADVENT**, or Time of Advent (Lat., the approach or coming), a term applied, by the Christian church, to certain weeks before Christmas. In the Greek church, the time of A. comprises forty days; but in the Romish church, and those Protestant churches in which A. is observed, only four weeks. The origin of this festival, as a church ordinance, is not clear. The first notice of A., as an appointment of the church, is found in the synod of Lerida (524 A.D.), at which marriages were interdicted from the beginning of A. until Christmas. The four Sundays of A., as observed in the Romish church and the church of England, were probably introduced into the calendar by Gregory the great. It was common from an early period to speak of the coming of Christ as *fourfold*: his "first coming in the flesh;" his coming at the hour of death to receive his faithful followers (according to the expressions used by St John); his coming at the fall of Jerusalem (Matt. xxiv. 30); and at the day of judgment. According to this fourfold

view of A., the "gospels" were chosen for the four Sundays, as was settled in the western church by the *Homiliarium* of Charlemagne. The festival of A. is intended to accord in spirit with the object celebrated. As mankind were once called upon to prepare themselves for the personal coming of Christ, so, according to the idea that the ecclesiastical year should represent the life of the founder of the church, Christians are exhorted, during this festival, to look for a spiritual advent of Christ. The time of the year when the shortening days are hastening towards the solstice—which almost coincides with the festival of the Nativity—is thought to harmonize with the strain of sentiment proper during A. In opposition, possibly, to heathen festivals, observed by ancient Romans and Germans, which took place at the same season, the Catholic church ordained that the four weeks of A. should be kept as a time of penitence; according to the words of Christ: "Repent, for the kingdom of heaven is at hand." During these weeks, therefore, public amusements, marriage festivities and dancing were prohibited, fasts were appointed, and sombre garments were used in religious ceremonies. The Protestant church in Germany has also abstained from public recreations and celebrations of marriage during A. It was perhaps a natural thought to begin the ecclesiastical year with the days of preparation for the coming of Christ. This was first done by the Nestorian church in the east in the 6th c.; the example was soon followed in Gaul, and afterwards became general throughout the west.

ADVENTISTS, a sect of millenarians; called "Millerites" after William Miller, the founder, b. Mass., 1781, d. 1849. About 1833 he began to preach the second coming of Christ, which was to occur in 1843, and made an early disciple of Joseph V. Hines, a man of great energy, who established *The Signs of the Times*, and after that *The Advent Herald*, to advocate the doctrine. They were followed by many thousands, chiefly of the uneducated class, and preparations and even ascension robes were made for the great day (in July, 1843); but it passed, and there was not an end of the world. Other fixed periods passed with the usual disappointment, and the sect dwindled, after Miller's death becoming almost unnoticeable. Still they exist, though they no longer fix specific dates for the great event, but say that it may happen at any moment. They differ from the standard doctrine of the church in other points besides their special view of Christ's personal coming; for most of them seem to hold that the soul is material, and dies with the body; and that only the righteous will share in the resurrection; though there is some variety of views among them on their point. It is supposed that regular A. number less than 20,000 in the United States.—ADVENT CHRISTIANS, known chiefly in the western states. They publish a weekly journal, *The Advent Christian Times*, tracts, etc.

ADVENTISTS, SEVENTH DAY, organized about 1844; they set no date for Christ's second advent. They are known chiefly in Michigan, where they have a publishing association; and they have sent missions to several countries in Europe, Africa and Australia. In 1877 they reported 106 ministers, 97 licentiates, 478 churches and 11,708 members. Besides their publishing house, they have a health reform institute, and an educational society. At the general conference in 1877 they resolved that "the highest authority under God among seventh day adventists is found in the will of the body of that people, as expressed in the decisions of the general conference when acting within its proper jurisdiction; and that such decisions should be submitted to by all without exception, unless they can be shown to be in conflict with the word of God and the rights of individual conscience." By the same conference the possession of the gift of prophecy by Mrs. White, widow of one of the elders, was recognized, and to it was ascribed the unity of doctrine and practice which prevailed among all the seventh day A., while other bodies of A. were crippled by divisions.

AD'VERB. As an adjective is joined to a noun, so is an A., for analogous purposes, to a verb, an adjective, or another A. From the frequency with which adverbs are joined to verbs, they get their name. An A. cannot be the subject, the copula or the predicate of a proposition; and is, therefore, a secondary part of speech, logically speaking. According to their signification, adverbs may be divided into—1. Adverbs of place, as *where, towards*; 2. of time, as *ever, immediately*; 3. of degree, as *very, almost*; 4. of manner, as *thus, wisely*; 5. of belief or doubt, as *perhaps, no*, etc.—It is commonly said that "some adverbs admit of comparison;" as if in this respect they differed from adjectives. The truth is that adverbs admit of comparison under the same limitations, neither more nor less, that restrict the comparison of adjectives. Thus, *soon* is compared as naturally as *hard*. If *now* or *thus* cannot be compared, neither can *wooden* nor *circular*; and in both cases for the same reason—the sense forbids it. The laws of euphony prevent alike *miserable* and *miserably* from being compared grammatically, i.e., by the addition of *er* and *est*; but both admit of logical comparison by the use of *more* and *most*.—A large class of adverbs in English are formed from adjectives by annexing the syllable *ly*, which is just the word *like*. Most languages have some such means of distinguishing the A. from the adjective, except the German, in which they are alike. Adverbs in general may be looked upon as abbreviations of phrases; thus *here* = *in this place*, *then* = *at that time*, *wisely* = *like a wise man*. Combinations of words that can thus be represented by a single adverb, and all combinations that are analogous, though they may have no single word equivalent to them, are called adverbial expressions.

**ADVERTISEMENT** (Fr. *avertissement*), the public notification of a fact. This is now commonly effected either by means of the ordinary newspapers, or of newspapers, printers' lists and other publications specially devoted to the purpose. Advertisements, both printed and written, are still posted on church-doors, and other places of public resort, in which case they are commonly called bills or placards. The most formal kind of A., and that which is employed in the case of royal proclamations and the like, is publication in the *Gazette* (q.v.); but so little is the *Gazette* read by private persons, that, as regards the customers, publication in it alone is not a sufficient notice of a dissolution of partnership to free the partners from debts afterwards contracted in name of the company. Public notifications are frequently enjoined by statute; as, for example, under road and bridge acts, the bankrupt statutes, etc. In many other ways their legal effects are important. Advertisements by public carriers, railway companies, and the like, are equivalent to offers whereby the advertiser will be bound to those who send goods on the faith and in accordance with the terms of the A. By advertising a *general ship*, for a particular voyage, the master places himself on the footing of a public carrier, and is bound to receive goods for the port to which the vessel is advertised to sail. A merchant in such circumstances can insist on his goods being received, unless the ship be full, or the entire freight engaged. The contract of affreightment is completed by the A., and the shipping of the goods in conformity and with reference thereto. See **CHARTER-PARTY, CARRIER**.—In 1833, the duty on advertisements, which was 3s. 6d. in Great Britain and 2s. 6d. in Ireland for each A., was reduced to 1s. 6d. in the former country, and 1s. in the latter (3 and 4 Will. IV. c. 23). In 1853 it was wholly repealed (16 and 17 Vict. c. 63). In 1833, the year previous to the reduction, the duty amounted to £170,650; in 1841 it was £131,608; and in 1853, the year of the repeal, it had increased to £180,000, thus exceeding the amount before the period of reduction. Advertisements are found in England as early as the middle of the 17th c.; but advertising was not general till the beginning of the 18th. In America, advertising has long been practiced to an enormous extent; and since the repeal of the duty, it has increased in this country at a very rapid rate. Most newspapers are rendered remunerative to their proprietors only by means of the advertisements which they contain. See *Sampson's History of Advertising* (1874). See **NEWSPAPER**.

**ADVERTISEMENTS** (*ante*). In the U. S., advertising has grown to a surprising extent within two or three decades, and is still growing, not only in the newspapers, but in boats, railway cars and public buildings. Fences, rocks and trees are covered with print and paint. So much was this the case along routes of travel that some years ago the legislature of N. Y. enacted a law against defacing natural scenery by such devices, and the advertisers then hired vacant spaces on conspicuous walls. The shower of advertisements in the shape of small handbills is incessant, and they are put into one's hands at every step, at church doors and in hotels, in public vehicles, thrust under private doors, and sent by millions through the mails. Large boats bearing on their sails huge advertisements sail up and down all the season before a crowded watering-place, and now and then a rain of advertisements comes from a wandering balloon. When daylight fails the magic lantern throws advertisements on large screens in conspicuous places in N. Y. and other cities. The eye and the ear are attacked by the indefatigable advertiser, and music, chord and discord, horns, bells, gongs and yells are used. In legitimate newspapers the progress of advertising has been wonderful. About forty years ago an advertising agency was started in N. Y. and barely lived for the first dozen years; now such establishments are counted by scores, and some of them do business amounting to many hundred thousand dollars in a year. The city papers that in 1850 were of four pages of six columns each are now of eight, twelve, sometimes twenty pages, of which more than half the space is taken up by advertisements. One paper receives more money now for one week's advertisements than it did from that source in the first three years of its existence, which period was about forty years ago. It has printed eighty columns and nearly 4000 new advertisements in a single issue. Prices of advertising vary widely, graded if at all by the character as well as the extent of circulation, and by position in the paper. Rates may be generally stated at from two dollars down to twenty cents a line in city papers of large or fair circulation. The highest prices are for the news column, or for a notice that appears to be the voluntary statement of the journal. In the matter of "wants," those who want occupation are charged half rates or less, while employers pay about 40 cents a line, and the latter rate is the highest for the greater portion of regular advertisements. The extent and apparent extravagance of American advertising astonishes Europeans. Not long ago one publisher would take a whole page on a given day of each of four or five city papers, in which he would repeat over and over again a single announcement that occupied only four or five lines. The cost to him was enormous, but he testified that it was a judicious outlay, for the mere notoriety of such prodigal expenditure led people to inquire about him, and his publication (a literary newspaper) speedily rose from a few thousands to more than a quarter of a million of copies a week. Odd forms of beginning advertisements are not new, and are not so popular as they were a few years ago. Some journals debar pictures and very large type, and business announcements are usually plain and practical. It is impossible to learn the extent of the business. Some houses and companies do an immense amount,

and some very little; but in general trade, such as dry goods, those who do the most business are the largest advertisers. For notice of meetings, lectures, amusements, the opera or the play of the night, for time of boats, trains, etc., the public in cities depend almost entirely upon the advertising columns of the morning and evening newspapers. When there was a duty of 3 per ct. on receipts for advertisements, in 1867, N. Y. city publishers paid \$80,000, representing about \$2,700,000 received for advertisements during the year.

#### ADVICE. See BILL OF EXCHANGE.

**ADVOCATE** (Lat. *advocatus*). An A. is generally defined "the patron of a cause," though it does not appear that the "patrons" who, in ancient Rome, assisted their clients with advice and pleaded their causes, were ever called by that name. Even in the time of Cicero, the term *advocatus* was not applied to the patron or orator who pleaded in public, but rather, in strict accordance with the etymology of the word, to any one who in any piece of business was called in to assist another. There can be no doubt, however, that the forensic orators and juriconsults of the later period of the republic, who followed law as a profession, and received fees (*honoraria*) for their services, occupied a position closely analogous to that of the A. of modern times, and thus it has been said that the profession is older than the name. The occupations of a juriconsult and a forensic orator seem to have differed pretty much as those of a consulting and a practicing counsel do with us. They might be exercised separately, but were generally combined; and thus Cicero speaks of his master, Sesevola, as "the most eloquent of the learned, and the most learned of the eloquent" (*jurisperitorum eloquentissimus, eloquentium jurisperitissimus, De Or.*, i. 39). Ulpian defined an A. to be any person who aids another in the conduct of a suit or action (*Dig.* 50, *tit.* 13), and in other parts of the digest it is used as equivalent to an orator (see also Tacit. *Annal.*, x. 6), so that the word would seem gradually to have assumed its modern meaning. The office of the A. or barrister who conducted the cause in public was, in Rome, as with us, altogether distinct from that of the procurator, or, as we should say, attorney or agent, who represented the person of the client in the litigation, and furnished the A. with information regarding the facts of the case. The distinction between these two occupations, however, obvious and important as it seems to us, does not everywhere prevail; and in many of the states of Germany, in Geneva, in America, and in some of our own colonies, as, for example, in Canada, they are united in the same person. In England and Ireland, advocates are called *barristers*, under which title will be found a statement of the duties and responsibilities which the A. undertakes to his client, and of the state of the profession in these countries. In Scotland, as in France, the more ancient name has been retained. (See ADVOCATES, FACULTY OF.)

In France, the *avocat* and *avoué* correspond very nearly to the barrister and attorney in England. The advocates do not form a corporation, in the technical sense, but are a free society or association (*ordre*), which has the power of protecting its members, and of exercising internal surveillance and discipline over them. Neither do they exercise any ministerial functions like those which public authority has conferred, under certain conditions and responsibilities, on *avoués* and notaries. The French A. is simply a free man, who has graduated in law, and possesses the privilege of addressing the tribunals. The advocates who practice in each court form a separate college, admission to which can be obtained only with the approval of those who are already members. Enrollment in the books of the college does not confer the title of A., for this title belongs to every licentiate who has taken the oaths before a court; but it gives the right of communicating (*droit de communiquer*) with the other members of the body, without which the exercise of the profession would be impossible. As a necessary consequence of this arrangement, erasure of the name of any individual from the list is equivalent to a prohibition to practice. The French A. possesses the same privileges as to irresponsibility for his advice, and for the facts contained in his instructions, which belong to members of the corresponding branch of the legal profession in this country. He is also entitled to plead covered (see BARRETTE), and as he has no action for his fees, they are, as with us, paid in advance. The French advocates have, on several occasions, resisted, as an encroachment on their privileges, the attempt to compel them to grant receipts for their fees. It further belongs to the etiquette of the bar of France that, in communicating articles of process to each other, no acknowledgment shall be exchanged; and we are told, with honest pride, that during the many centuries that this custom has existed, not one single instance of its abuse has occurred.

In Belgium, in Geneva, and also in those of the German states by which the code Napoleon has been received, the organization and discipline of this branch of the legal profession are similar to those which prevail in France. In the other German states, with the exception of Saxony, the formation of the advocates into a body has been perseveringly resisted by the governments. A general assembly of German advocates was attempted at Mayence in 1844, and in Hamburg in 1846; and in the latter city it actually took place in the following year, but it led to no permanent results.

**ADVOCATE, LORD.** The L. A. for Scotland, called also the king's or queen's A., is the public prosecutor of crimes, senior counsel for the crown in civil causes, and a political functionary of very great importance in the management of Scottish affairs.

He may issue warrants for arrestment and imprisonment in any part of Scotland, and possesses many other discretionary and indefinite powers. Previous to the union, the king's A. had a seat in the parliament of Scotland *ex officio*; and since that event he has been almost invariably a member of parliament. He is appointed by the crown, and his tenure of office ceases with that of the administration of which he is a member. As first law-officer of the crown for Scotland, the L. A., when in parliament, is expected to answer all questions relating to the business of Scotland, and to take the superintendence of legislation for that portion of the united kingdom. Notwithstanding his multifarious official duties, the L. A. accepts ordinary practice at the bar, and, indeed, is usually the most extensively employed practitioner connected with the party in power. He is assisted in the duties of public prosecutor by the solicitor-general, and by four junior barristers, called advocates-depute, appointed by himself. The L. A. and solicitor-general are alone entitled to plead within the bar, and they are the only barristers in Scotland who have the distinction of silk gowns. When the L. A. declines to prosecute, it is competent for a private party to do so; and in this case the concurrence or "concourse," as it is called, of the L. A., which is granted as a matter of course, must be obtained. Such a proceeding, however, is scarcely known in practice in Scotland. The best historical account of this important, and, in many respects, anomalous office, with which we are acquainted, is contained in the judgment of the late lord Medwyn in king's A. against lord Douglas, Dec. 24, 1836. In England, the sovereign pursues in his own name; and such was the practice in Scotland, also, till about the middle of the 16th c., when we find queen Mary prosecuting by her advocate; probably in imitation of the French custom. For some time after the institution of the college of justice in 1532, the A. for the crown was always one of the judges of the court of session, and as in France the king's A. were also at the same time judges, this coincidence has been mentioned by Sir George Mackenzie in proof of the French origin of the office; but a combination of offices, now held to be incompatible, was not then uncommon. Lord Medwyn informs us that among the original fifteen ordinary judges was Sir Adam Otterburne, who was king's A. from 1525 to 1538, and also provost of Edinburgh from 1524 to 1535. So late as 1686, Sir George Lockhart, when president of the court, was ordered by a letter from king James VII. to officiate as his A. in parliament. It is not certain that the king's A. was originally authorized to act as public prosecutor in crimes; but he certainly possessed that power in 1587 (c. 77), and it seems to be implied in an earlier statute (1579, c. 78). It was indeed, as lord Medwyn remarks, less of an anomaly that a judge of the court of session should act as the representative of the crown in criminal than in civil causes, seeing that the former were adjudged in another court. The king's A. is first mentioned as *Lord A.* in the record of the court of justiciary in 1598. But although it was not till the institution of the college of justice that this office was placed on its present footing, we have mention of its existence in 1479; but the king's A. was not then one of the officers of state, a dignity, indeed, which he does not seem to have attained till 1540. In 1582, the salary of the L. A. was only £40 Scots. His present salary is £2387, and he is entitled to perquisites which raise his emoluments greatly above that sum. The L. A.'s deputies have £700 a year, and his legal secretary £500. The crown-agent, who is a writer to the signet (q.v.), and who performs in reference to crown causes pretty much the same duties that fall to an attorney or agent in ordinary litigation, receives £1400. As to the relation in which the L. A. stands to the public prosecutors of crimes in the inferior courts, see PROCURATOR-FISCAL. The L. A., though not a privy-councilor, is, by courtesy, addressed as the right honorable during his tenure of office.

**ADVOCATE OF THE CHURCH**, in the middle ages, a canon who assumed protection of a see or a particular church, defending its rights, and sometimes collecting tithes. The priests assumed this duty for the sake of the money to be made. Urban III., in 1186, tried to break up the abuse, but it was not reformed until long afterwards.

**ADVOCATES, FACULTY OF**, in Scotland. The constitution of this body, like the name by which its members are known, was unquestionably derived from France. The profession seems to have existed in Scotland from a very early time; and in 1424 (c. 45) a statute was passed for securing the assistance of A. to the poor. The words of the statute are remarkable, and its spirit, when we consider the period, highly creditable to the humanity and enlightenment of the Scotch. "And gif there be onie pure creature, for faulte of cunning, or dispenses, that cannot, nor may not follow his cause, the king, for the love of God, sall ordaine the judge before quhom the cause sulde be determined, to purwey and get a leill and a wise advocate, to follow sik pure creatures causes; and gif sik causes be obtained [gained], the wranger [wrong-doer] sall assyith baith the partie skaithed, and the advocatis coastes and travel." This institution has remained with little alteration to the present time (see POOR'S ROLL). But though existing as a profession, the A. of Scotland did not form a faculty or society till the institution of the college of justice (q.v.) in 1532. At first, their number was limited to ten, but there is now no limit. The number on the rolls of the body is about 370; but the number of those who practice does not exceed 120. Even of these a very small fraction live by the practise of the profession. From the improvements which have been made in the sheriff-courts, and from other causes, the amount of litigation in the court of session has greatly diminished since the beginning of the present c., and the continued accession of new

members to the faculty of A. is to be accounted for only by the fact that the bar is still regarded as the regular avenue to public and official life in Scotland. Two examinations are imposed on candidates for admission, the one in general scholarship, the other in law; the first, however, being dispensed with in case the intrant shall produce evidence that he is a M.A. of any British university, or that he has attained such degree in a foreign university as, in the opinion of the dean of faculty and his council, affords evidence of the same amount of scholarship as that afforded by the degree of M.A. of a Scottish university. Should no such degree be possessed, an examination takes place before a committee of the faculty, assisted by three or more persons of learning (generally professors in the university of Edinburgh), on the following subjects: 1. Latin; 2. Greek, or (in the intrant's option) any *two* of the following languages, namely, French, German, Italian, Spanish; 3. Ethical and metaphysical philosophy; 4. Logic, or (in the intrant's option) mathematics. If the intrant be found qualified in general scholarship, he may, after the expiry of a year, go in for his private examination on law. The examiners, however, cannot take him on trial if, during the year before such examination, he have been engaged in any trade, business or profession, either on his own account or as assistant to or in the employment of another. Proof of attendance on the law-classes in the university of Edinburgh is also requisite. An advocate is entitled to plead in every court in Scotland, civil, ecclesiastical, or criminal, superior or inferior; and also before the house of lords. A party may manage his own cause in the court of session (q.v.), so far as oral pleading is concerned, but, with exception of defences, every paper in process must be signed by an advocate. There is a widow's fund belonging to the body, which is also regulated by statute. The supreme judges of Scotland, and principal sheriffs, are always, and the sheriff-substitutes generally, selected from the bar. The fees on admission to the F. of A. are about £340.

**ADVOCATES' LIBRARY.** This library, which belongs to the faculty of advocates in Edinburgh, was established by Sir Geo. Mackenzie in 1682. It had at first no fixed fund: the faculty, from time to time, set apart sums for its maintenance, and donations were made for its use, not only by advocates but by others. By the copyright law of 1709, it obtained, along with eight other libraries, the privilege of receiving a copy of every new book. This privilege is still continued to the A. L. (5 and 6 Vict., c. 45, s. 8), although withdrawn from the other Scottish libraries; and to this is mainly owing the complete character of the collection in British books. It is comparatively deficient in foreign literature and science; for the faculty have no other funds at their disposal than the fees derived from "intrants," and the sum they are able to devote to the maintenance of the library is quite inadequate. The number of volumes is estimated at about 250,000; the catalogue (7 vols. 4to) was printed between 1867 and 1878. It is particularly rich in law; in Scottish history and antiquities; in the works of the fathers and schoolmen, and in theology generally. The Spanish department is particularly valuable. Notwithstanding the unsuitable nature of the building for library purposes, the improvements made in 1871, especially in the lower library, have added much both to its appearance and the convenience of all who have to do with it. Although the library belongs strictly to the faculty of advocates, yet, under their liberal management, it has in a great degree the character of a public institution. Any stranger arriving in Edinburgh is admitted to see the library; and with an introduction any one may resort to it to consult books. Books may even be borrowed through the members of the faculty, who are remarkably liberal in this respect. Thomas Ruddiman and David Hume both held the office of librarian or keeper of the advocates' library.

**ADVOCATION**, a form of process in the law of Scotland, to remove a cause from an inferior court to the supreme court, either for the purpose of review, or that the cause might be conducted in the court of session. Final judgments of inferior courts were brought under review of the court of session by lodging a written note of A. with one of the depute-clerks of session or his assistant (1 and 2 Vict. c. 86). A certified notice of this proceeding put a stop to all further steps in the original cause. Caution used to be found for the expenses incurred, or which might be incurred, in the court of session. See **CAUTION** and **JURATORY CAUTION**. As a rule, A. was competent unless debarred by statute or confirmed practice; but no cause was advocated unless exceeding the value of £25 (16 and 17 Vict. c. 80, s. 22). A. was incompetent in actions limited to particular courts by express statute, e.g., by the small debt acts, road acts, etc. Every case in which the claim exceeded £40 might be removed into the court of session, so soon as an order allowing a proof had been pronounced, should either party be of opinion that it ought to be tried by jury. The process of advocacy was abolished in 1868, and all similar proceedings are now called appeals from the sheriff court, and it is not now necessary for the appellant to find caution for expenses before taking or prosecuting his appeal. This appeal cannot be taken after six months from the date of final judgment. It may be taken within twenty days after judgment, and thereafter may be taken up to six months, provided the decree has not been in the meantime extracted or implemented (31 and 32 Vict. c. 100, s. 64).

**ADVOCATUS DIABOLI**, the devil's advocate. In the Romish church, when it is proposed that a deceased person shall be canonized, an examination of his past life takes place. In this process, one party holds the office of accuser, or *advocatus diaboli*; and it is his duty to bring forward all possible objections against the proposed canonization; while,

on the other side, the *Advocatus Dei* (God's Advocate) undertakes the defense. Hence the term A. D. has been applied to designate any person who brings forward malicious accusations.

**ADVOWSON.** The right of presentation to a church or ecclesiastical benefice in England. Advowsons are either *appendant* or *in gross*. Lords of manors were originally the only founders, and, of course, the only patrons of churches; and so long as a right of patronage continues annexed or appended to the manor, it is called an A. appendant. Such rights are conveyed with the manor as incident thereto, by a grant of the manor only, without adding any other words. But where the property of the A. has been once separated from the property of the manor by legal conveyance, it is called an A. *in gross*, or at large, and is annexed to the person of its owner, and not to his manor or lands. Advowsons are further divided into *presentative*, *collative*, or *donative*. The first is where the patron has the right of presentation to the bishop or ordinary, and may demand of him to institute his clerk, if he find him canonically qualified. This is the most usual A. The second or collative A. is where the bishop and patron are one and the same person. In this case, the bishop cannot present to himself, but he does by the one act of collation the whole that is done in common cases by both presentation and institution. The third or donative A. is when the sovereign, or a subject by his license, founds a church or chapel, and ordains that it shall be at the sole disposal of the patron, subject to his visitation only, and not that of the ordinary, and vested in the clerk by the patron's deed of donation, without presentation, institution, or induction. "This is said to have been anciently the only way of conferring ecclesiastical benefices in England; the method of institution by the bishop not being established more early than the time of archbishop à Becket, in the reign of Henry II."—*Kerr's Blackstone*, vol. ii. p. 20.

**ÆACUS**, the fabled son of Jupiter and Egina, and king of Egina; father of Telamon and Peleus. He was so renowned for justice that not only men, but the gods, sought for his decisions. After death, Pluto made him one of the judges in Hades.

**ÆDILES**, Roman magistrates, who had the care of public buildings (*ædes*), especially the temples, and also attended to the cleansing and repairing of the streets, the preparations for funerals, public games and spectacles, the inspection of weights and measures, the regulation of markets, etc.—At first there were only two Æ., who were chosen from the plebeians, and styled *Æ. plebis*; afterwards, two others, styled *Æ. curules*, were chosen from the patricians (366 B.C.), and Julius Cæsar appointed a new order of *Æ. cereales* to take charge of the public granaries.

**ÆDUI**, or **HEDUI**, a people of Celtic Gaul, between the Saône and Loire. They were the first Gallic tribe that joined in the alliance against the Romans, who had relieved them from a German tyrant. They fought against Julius Cæsar, but were overthrown. Bibracte (now Autun in Burgundy) was their chief town.

**ÆGEAN SEA.** See **ARCHIPELAGO**, *ante*.

**ÆGINA**, now written Egina, an island forming part of the kingdom of Greece, of about 40 sq.m. in area, in the ancient Saronicus Sinus, now the gulf of Egina. It is mountainous, with deep valleys and chasms; and the coast affords only one haven on the n.w. The modern t. of Egina stands on the site of the ancient t., at the n.w. end of the island. The island contains about 7000 inhabitants, who are chiefly occupied in trade, navigation and agriculture. The soil produces the best almonds in Greece, with wine, oil, corn and various fruits. Partridges abound in such numbers that the people find it necessary to thin them by destroying their eggs. The most ancient name of the island was *Enone*, and, according to tradition, the Myrmidons dwelt in its valleys and caverns. In ancient times, the people of Æ. had considerable importance in Greece; and their fleet distinguished itself for valor in the battle of Salamis. Their prosperity excited the envy of the Athenians, who made the island tributary, and afterwards expelled altogether the original inhabitants. The language, manners, and style of art among the ancient people of Æ. were Dorian.

**ÆGINEȚA**, **PAULUS**, a surgeon of the island of Ægina, probably in the 7th c. He was a man of great knowledge, and left a synopsis of medicine, in seven books, of which the one on surgery is particularly interesting. He was the first writer to notice the cathartic properties of rhubarb, and the first physician who deserved the title of *accoucheur*.

**ÆGINEȚAN SCULPTURES.** The small island of Ægina holds an important position in the history of Grecian art. A severely natural character belongs to its works of sculpture, of which several have been discovered in modern times. On an eminence in the eastern part of the island stand the ruins of a temple, usually called the temple of Jupiter Panhellenius, but now believed to have been a temple of Pallas or Minerva. Among these ruins a series of statues were excavated by a company of Germans, Danes and Englishmen, which, in 1811, were purchased by Louis, then crown-prince of Bavaria, and are now the most remarkable ornaments of the Glyptothek at Munich. They are of various heights, and were evidently intended to decorate the tympana of the temple beside which they were found. The group that seems to have been designed for the hinder tympanum is superior in preservation, and represents a combat of Greeks and Trojans for the body of a fallen hero. The other group is the contest of Telamon with Laome-

don. The figures are true to nature, as in the old Greek style, with the structure of bones, muscles, and even veins, distinctly marked; but the faces have that unpleasant, forced smile which is characteristic of all sculpture before the time of Phidias.

ÆGIR (Anglo-Sax. *eager*, "the sea"), a Norse god, presiding over stormy oceans, who entertains the gods in harvest time. The name survives in England, where a sudden wave or "bore" running into a river from the sea is called an *eygre*, or *eager*.

ÆGIS, the shield of Jupiter, which had been fashioned by Hephestus (Vulcan). When Jupiter was angry, he waved and shook the Æ., making a sound like that of a tempest, by which the nations were overawed. The Æ. was the symbol of divine protection, and became, in course of time, the exclusive attribute of Jupiter and Minerva.

ÆGISTHUS, a king of Mycenæ, adopted son of Atreus. He was a cousin of Agamemnon, whose wife Clytemnestra he seduced, and he was slain by Agamemnon's son Orestes. If Greek writers are to be believed, the family relations of Ægisthus were abominable.

ÆGIUM, an ancient city of Greece, for a time the chief city in the Achæan league. It was on the Salinus river. In Aug., 1817, an earthquake destroyed more than half of the houses of the modern town.

ÆGLĒ, a genus of plants of the natural order *aurantiacæ* (q. v.), distinguished by a five-toothed calyx, linear elongate mucronate anthers, and a many-celled fruit. *Æ. mar-melos*, the tree which produces the *bhel* fruit of India, has ternate, petiolate, ovato-oblong leaves, and the flowers in panicles. It is found from the s. of India to the base of the Himalaya mountains. The fruit is delicious, fragrant and nutritious. In an imperfectly ripened state it is an astringent of great effect in cases of diarrhœa and dysentery, and as such has lately been introduced into English medical practice. The root, bark and leaves are also used as medicinal. The Dutch in Ceylon prepare a perfume from the rind of the fruit, and the mucus of the seed is employed as a cement for many purposes.

ÆGOSPOTAMI, or ÆGOSPOTAMOS (Gr. goat-river), in the Thracian Chersonese, is famous for the defeat of the Athenian fleet by the Lacedæmonians under Lysander, which put an end to the Peloponnesian war and to the predominance of Athens in Greece, 405 B. C.

ÆGYPTUS, son of Belus, brother of Danaus, and king of Arabia, who conquered the region to which he gave the name Egypt. The poetic legend was that he had fifty sons, who were all murdered by the same number of daughters of Danaus, whom they sought to marry.

ÆLFRIC, or ALFRIC, a distinguished Saxon ecclesiastic of the 10th c., regarding whose age, writings, and personality even, there has been a great difference of opinion amongst antiquaries. He appears to have been the son of the ealdorman or earl of Kent; but early manifesting a devotional spirit, he entered the monastery of Abingdon, the members of which belonged to the Benedictine order. Towards the close of the 10th c., he became a priest in the cathedral of Winchester. He was next appointed abbot of St. Albans, then bishop of Wilton, and finally archbishop of York, although others appear to think him that Æ. who was archbishop of Canterbury. Æ., archbishop of York, died in 1050; Æ., archbishop of Canterbury, in 1005. The writer Æ., whether of York or of Canterbury, was a man of superior attainments for his time, of excellent character, and one whose religious convictions were less disfigured by superstition than those of his contemporaries. The principal works ascribed to Æ. are—1. A Latin and Saxon glossary, printed at Oxford in 1659; 2. A Saxon version of most of the historical books of the Old Testament; 3. A charge to his clergy; 4. Two volumes of Saxon homilies; 5. A Saxon grammar in Latin.

ÆLIA CAPITOLINA, the name given to Jerusalem by Hadrian, who expelled the Jews for rebellion, and colonized the city with Romans. The name continued until the time of the Christian emperors.

ÆLIA'NUS, CLAUDIUS, an Italian writer early in the 3d c. His works are *Varia Historia* and *De Animatum Natura*, and are written in Greek.

ÆLST, or AALST, EVERT VAN, 1602-58; a Dutch painter, who excelled in depicting flowers and dead animal objects.

ÆLST, or AALST, WILLEM VAN, 1620-79; a painter of Holland, nephew and pupil of Evert Van, and his superior in similar lines of work.

ÆMILIAN PROVINCES. See EMILIAN PROVINCES.

ÆMILIUS PAULUS. The most remarkable of this name was the son of the consul Æ. P., who fell in the battle of Cannæ, 216 B. C. Young Æmilius inherited his father's valor, and enjoyed an unwonted degree of public esteem and confidence. In 168 B. C. he was elected consul for the second time, and intrusted with the war against Perseus, king of Macedon, whom he defeated in the battle of Pydna. During the war, his two younger sons died; and Æ. is said to have thanked the gods that they had been chosen as victims to avert calamity from the Roman people.

ÆNEAS, the hero of Virgil's *Æneid*, was, according to Homer, the son of Anchises and Venus, and was ranked next to Hector among the Trojan heroes. The traditions of

his adventures before and after the fall of Troy are various and discordant. Virgil gives the following version: Æneas, though warned by Priam in the night when the Greeks entered Troy, to take his household gods and flee from the city, remained in the contest until Priam fell, when, taking with him his family, he escaped from the Greeks, but in the confusion of his hasty flight, lost his wife Creusa. Having collected a fleet of twenty vessels, he sailed to Thrace, where he began building the city of Ænos, but was terrified by an unfavorable omen, and abandoned his plan of a settlement here. A mistaken interpretation of the oracle of Delphi now led him to Crete; but from this place he was driven by a pestilence. Passing the promontory of Actium, he came to Epirus, and then continued his voyage to Italy and round Sicily to the promontory of Drepanum on the w., where his father, Anchises, died. A storm afterwards drove him to the coast of Africa, and landing near Carthage, he was hospitably received and entertained by queen Dido. His marriage with Dido was prevented by Jupiter, who sent Mercury with a command that Æneas must return to Italy. Accordingly, he sailed away, leaving the disappointed queen, who committed suicide. During his stay in Sicily, where he celebrated the funeral of his father, the wives of his companions and seamen, weary of long voyages without certainty of finding a home, set fire to his fleet. After building the city Acesta, he sailed for Italy, leaving behind him the women, and some of the men belonging to his fleet. On landing in Italy, he visited the Sibyl at Cumæ, and received intimations of his future destiny. Then, sailing along the Tiber, and landing on the e. side of the river, he found himself in the country of Latinus, king of the Aborigines. Lavinia, the daughter of Latinus, had been destined to marry a stranger; but her mother had promised to give her in marriage to Turnus, king of the Rutuli. A war ensued, which terminated in the marriage of Æneas with Lavinia. Their son, ÆNEAS SYLVIVS, as the ancestor of the kings of Alba Longa, and also of Romulus and Remus, was regarded as the founder of the Roman empire. It is hardly necessary to add that all these statements are merely mythical, having no historical basis.

**ÆNIA'NES**, a tribe of upper Greece of uncertain origin, noticed by Plutarch. They made many migrations. Their chief t. was Hypata, remains of which exist at Neopatra. They are said to have belonged to the Amphyctionic council, and to have joined the confederacy against Macedonia; but Strabo says that at this time they had no existence.

**ÆOLIAN HARP**, a very simple musical instrument which produces harmonic sounds when placed in a current of wind. It is formed by stretching eight or ten strings of catgut, all tuned in unison, over a wooden shell or box, made generally in a form sloping like a desk. The sounds produced by the rising and falling wind, in passing over the strings, are of a drowsy and lulling character, and have been beautifully described by the poet Thomson, as supplying the most suitable kind of music for the *Castle of Indolence*.

**ÆOLIAN ISLES**. See **LIPARI ISLANDS**, *ante*.

**ÆOLIANS**, one of the principal races of the Greek people, who were originally settled in Thessaly, from which they spread and formed numerous settlements in the northern parts of Greece and in the w. of Peloponnesus. In the 11th c. B.C., some part of them emigrated to Asia Minor, where they founded, on the n.w. coast in Mysia, and the adjacent isles, more than thirty cities; among them Smyrna, and Mitylene in the island of Lesbos, where the Æolian dialect of the Greek language chiefly developed itself in the forms employed in the poetry of Alcæus and Sappho. The Æolian shared the fate of the other Grecian colonies in Asia Minor. First oppressed by the Lydian kings, then deprived of their independence by the Persians, they became a portion of the great empire founded by Alexander, and, passing through a stage of subjection to the dynasty of the Seleucidae, were ultimately absorbed in the Roman empire.

**ÆOLIPYLE**, or **ÆOLIPYLE**, a hollow metal ball with one or two inner tubes curved in opposite directions and connecting with surface orifices. Used, when filled with water or alcohol, to show the force of steam, or as a blow-pipe for lamp flame. The ancients thought it illustrated the origin of winds; hence the name, from *æolus* and *pilla*, a "ball."

**ÆOLIS**, district of Asia Minor, on the coast of Mysia, including Troas to the shore of the Hellespont. In the s. part there were twelve cities which formed the Æolian league; of them, Cyme and Smyrna were the most famous.

**ÆOLUS**, son of Hellen, brother of Dorus, and father of Sisyphus. He ruled over Thessaly, and is said to have been the founder of the Æolic branch of the Greek race.

**ÆOLUS**, god of the winds; a favorite of Juno. He was supposed to dwell in a vast cave in the Æolian islands, keeping the winds in bags, and letting them out as demanded by Neptune.

**ÆON**, a Greek word signifying an age, and also eternity. The Gnostics spoke of Æons, in a peculiar sense, as powers that had emanated from God before the beginning of time, and existed as distinct entities or spirits. They were called Æons either as partaking of the eternal existence of God or because they were thought to preside over the various ages and transformations of the world. See **GNOSTICISM**.

**ÆPINUS**, FRANZ ULRICH THEODOR, 1724-1802; a descendant of Johann; professor of medicine and natural philosophy; experimenter in electricity, and inventor of the electric condenser and electrophorus. He wrote a work to establish a new theory of

electricity, endeavoring to subject its phenomena to mathematical analysis. Catherine II., empress of Russia, made him teacher to her son Paul, and inspector-general of the normal schools which she proposed to establish. He discovered the electric properties of tourmaline.

**ÆPINUS**, JOHANN, 1499-1553; a German Protestant divine, a disciple of Luther, in whose behalf he suffered arrest, although he had the most influence of any divine in n. Germany. He was a pastor in Hamburg, and one of the signers of the articles of Schmalkalden; was the author of polemical books, and was moderately upheld by Melancthon.

**ÆQUI**, an ancient warlike tribe of central Italy; obstinate enemies of the early Romans, against whom they made alliances with the Volsci. They were defeated by Camillus, 389 B.C., and soon afterwards were quite subdued. Mt. Algidus was one of their strongholds, whence they raided on Rome.

**ÆRA'RIANS**, a class in Rome having no social position now definable, and having no civil rights beyond the mere protection of the state. For bad conduct any citizen might be degraded to this condition, but not for life. Persons declared infamous became of this class, and it probably included itinerant retail merchants. They were taxed, but were not subject to military service.

**ÆRA'RIUM**, the public treasury of ancient Rome, containing the money and accounts of the states, the standards of the legions, the public laws engraved in brass, the decrees of the senate, and other documents of importance. The temple of Saturn was the place of deposit. Besides this common treasury, replenished by general taxes and charged with ordinary expenditures, there was a reserve treasury, maintained by a tax of 5 per cent on the value of manumitted slaves, which was not to be resorted to or even entered except in extreme necessity. In addition to the treasuries, the emperor had a "fiscus," or separate exchequer. Augustus established a military treasury to contain all money for the maintenance of the army. Later emperors had separate private Æ., containing the moneys appropriated to their private use.

**A'ERATED BREAD** is prepared by a process patented about twenty years ago, and is now coming into use in large cities. In ordinary bread-making, wheat-flour is moistened with water and worked into dough, to which common salt and yeast are added. The latter causes the flour to ferment or decompose, when carbonic acid is given off at every part; and when the fermented dough is placed in an oven, the bubbles of carbonic acid gas expand, and cause the formation of the spongy mass characteristic of good loaf-bread. The process of preparing A. B. consists in placing the flour in a strong inclosed iron box, and moistening it with carbonic acid water, prepared as stated under A. **WATERS**. The dough is then worked up by machinery for ten minutes or so inside the box, from which it is dropped into molds, which form it into loaves. It is then placed in an oven, when the carbonic acid, previously introduced with the water within the dough, expands, and forms a light palatable bread. The advantages which this method of working bread possesses are—1. There is a saving of the whole of the waste caused by fermentation, which admits of more bread being made out of a sack of flour than by the old process. 2. The process, instead of occupying eight or ten hours, is completed in half an hour. 3. The cost of machinery and gas is less than that of yeast used in the old process. 4. The dough requires no handling to knead it and form it into loaves. 5. The bread is absolutely pure—it is simply flour, water and salt. Finally, should the whole of the bread in the kingdom be thus made, a very considerable saving would be effected in the consumption of flour. (See UNFERMENTED BREAD.)

**A'ERATED WATERS** are employed largely as refreshing, refrigerant beverages to allay thirst during warm weather, and during feverish conditions of the animal frame. The

*gène*. The complete apparatus is seen at A, and dissected at B and C. In proceeding to use the vessel, the lower globe at B is filled with water by means of the long funnel

most common A. beverage is *carbonic acid water*, generally spoken of as soda-water, though it seldom contains any soda. It is prepared on the large scale by placing whitening, chalk, or carbonate of lime ( $\text{CaO}, \text{CO}_2$ ) in a lead vessel with water and sulphuric acid ( $\text{SO}_3$ ), when the sulphuric acid combines with the lime to form stucco or sulphate of lime ( $\text{CaO}, \text{SO}_3$ ), and carbonic acid ( $\text{CO}_2$ ) is evolved as gas. The latter is received in a reservoir, and is thereafter forced into water, so that the latter dissolves about five times its own volume of the gas. The water then constitutes a brisk sparkling liquid, with a pungent but pleasant acidulous taste. On the small scale, and for family use, carbonic acid water may be conveniently prepared in the apparatus known as the *gazogène* or *seltzogene*.

E, taking care that no water runs into the smaller and upper division. The powders, consisting of bicarbonate of soda ( $\text{NaO}, \text{HO}, 2\text{CO}_2$ ) and tartaric acid ( $\bar{\text{T}}$ ), are then placed in the upper globe by means of the small funnel D, and care is taken, by plugging up the tube communicating with the lower part by the stopper F, that no powder passes into the larger globe. The long tube, C, is then inserted into the globes, and screwed well in. The apparatus is inclined till water from the lower globe enters and fills the upper globe about one third; then it is placed erect, and allowed to be at rest for two hours, when, if the screw stop-cock at the upper part be opened, the carbonated water will flow out readily into any vessel placed to receive it. The explanation of the action which goes on in the vessel is that tartaric acid and bicarbonate of soda have no action on each other so long as they are dry; but whenever water is admitted, the tartaric acid combines with the soda and water to form tartrate of soda and water ( $\text{NaO}, \text{HO}, \bar{\text{T}}$ ), and at the same time carbonic acid ( $\text{CO}_2$ ) is given off, and descending the tube into the lower globe, dissolves in the water contained therein. Occasionally, bisulphate of potash is used instead of the tartaric acid, to save the greater expense of the latter.—The gazogènes can likewise be used in the preparation of true soda-water, or *eau de vichy*, by adding a little carbonate of soda to the water in the lower globe before charging with carbonic acid. *A. vine* may be obtained by placing white wine with a little sugar-candy in the lower globe instead of water. *Sparkling lemonade* is procured when the carbonic acid water is run into a tumbler containing a little syrup of sugar; and *A. fruit-beverages*, when the water charged with carbonic acid is received in a glass containing about a table-spoonful of any of the fruit-syrups.

The less common A. W., prepared on the large scale, are—1. *A. soda-water* (true soda-water), obtained by adding 15 gr. of crystalized carbonate of soda to each bottle before it is charged with the carbonic acid water; 2. *A. potash-water*, by employing in a similar way 20 gr. of bicarbonate of potash; 3. *A. settlers-water*, when carbonate of soda and chloride of sodium (common salt) are dissolved in carbonic acid water; 4. *A. carrara-water*, when finely divided Carrara marble is dissolved in the acid-charged water; 5. *A. lime-water*, when other forms of lime than the Carrara marble are used; 6. *A. magnesia-water*, when magnesia, or the carbonate of magnesia, is used; and *A. chalybeate-water*, when a compound of iron is dissolved in the carbonic acid water. The latter beverage has lately been employed in medicine, as an easy means of introducing iron into the blood, and with good effect. A. Carrara and lime waters are now administered in cases where the bony structure requires to be strengthened, and A. magnesia-water is a very agreeable mode of giving a patient a dose of magnesia. The well-known effervescing draughts called *soda-powders* and *seidlitz-powders* are two other kinds of A. drinks. In the former, bicarbonate of soda and tartaric acid are added to water in a tumbler, and a refreshing draught instantaneously prepared. *Seidlitz-powders* contain tartrate of soda and bicarbonate of soda in one paper, and tartaric acid in the other; and when both are added to the water, effervescence ensues, and the liquid is then partaken of.

A. W. likewise occur naturally. Water, as it is drawn from a spring, tastes differently from the same water after being boiled and cooled; and this is due to the unboiled water containing the gases oxygen, nitrogen and carbonic acid—especially the latter—dissolved in it. Spring-water is therefore a natural A. beverage. Rain-water has a mawkish, insipid taste, mainly because of the minute quantity of gas therein dissolved; but when that rain-water trickles down the mountain-side, and is dashed from ledge to ledge of rock, it absorbs and dissolves the gases from the air, and is thus naturally aerated. Many waters are aerated in a natural but peculiar way, which confers upon them important medicinal properties; and these will come before us under their more popular title of *mineral-waters*.

#### ÆRIAL POISONS. See MIASMA.

ÆRIANS, a sect founded by Ærius of Pontus, who opposed prayers for the dead, the keeping of Easter, and certain forms of church government, holding no difference between a bishop and a presbyter.

ÆRODYNAMICS is that branch of science which treats of air and other gases in motion. It examines first the phenomena of air issuing from a vessel, which correspond in many respects with those of water. See HYDRODYNAMICS. Much depends, as in the case of water, upon the nature of the orifice, whether a mere hole in the side of the vessel, or a tube or adjutage. Another subject of A. is the motion of air in long tubes, where the resistance of friction, etc., has to be ascertained. That resistance is found to be nearly in proportion to the square of the velocity, to the length of the tube, and inversely to its width. A. examines also the velocity of air rushing into a vacuum, of wind, etc. The instrument used for the latter purpose is called an anemometer. See WINDS. Air is found to rush into a void space at the rate of from 1300 to 1400 ft. per second. One of the most important inquiries in A. is the resistance offered to a body moving in air, or—which is the same thing—the pressure exerted by air in motion upon a body at rest. The law may be stated, with sufficient accuracy for practical purposes, as follows: *The resistance or pressure is proportional to the square of the velocity.* We might conclude from reason, without experiment, that such would be the case; for if one body is moving through the air four times faster than another of the same size, not only will it encounter

four times as many particles of air, but it will give each of them four times as great an impulse or shock, and thus encounter  $4 \times 4$ , or sixteen times as much resistance.

This resistance is greatly increased by another circumstance, especially with great velocities. The air in front of the moving body becomes accumulated or condensed, and a partial or even entire vacuum is formed behind it. With a velocity of 1700 ft. per second, for instance, the resistance is found to be about three times as great as the simple law of the square of the velocity would give. By the operation of these laws of resistance, a heavy body let fall with a parachute attached to it, comes, after a certain time, to move with a velocity approaching more and more nearly to a uniform motion.

**ÆTROE**, or **ARRÖE**, an island in the Baltic, 14 m. s. of Funen; 14 m. long and 5 wide; it has a port and is well cultivated; pop., 12,400. It belongs to Schleswig Holstein, and the capital, Æroesjkobing, is a port of some shipping importance.

**ÆROKLINOSCOPE**, an instrument to show differences of barometric pressure at remote stations. It consists of a vertical axis 80 ft. high, turning on a pivot, carrying at the top a horizontal arm, of which the inclination can be varied according to the difference of barometric pressure at different sides of the station; the amount of dip being indicated by a sliding rod held in position by graded notches at the lower part of the axis, each notch corresponding with one millimetre in pressure. It is used in the weather service.

**ÆROLITES** (Gr. *aer*, air, and *lithos*, stone), or **METEORIC STONES**, **FIREBALLS**, and **SHOOTING-STARS**, are now classed together as being merely varieties of the same phenomenon. A. that fall during the day are observed to be projected from a small dark cloud, accompanied by a noise like thunder or the firing of cannon; at night they proceed from a fireball, which splits into fragments with a similar sound. It is believed that the dark cloud that accompanies the fall of A. by day would be luminous at night; and smoking, exploding fireballs have sometimes been seen luminous even in the brightness of tropical daylight. The connection between A. and fireballs is thus established. Fireballs, again, cannot be separated from shooting-stars, the two phenomena being sometimes blended, and also being found to merge into one another, both with respect to the size of their disks, the emanation of sparks, and the velocities of their motion.

There are numerous records and stories in all ages and countries of the fall of stones from the sky, but until recent times they were treated by philosophers as instances of popular credulity and superstition. It was not till the beginning of the 19th c. that the fact was established beyond a doubt.—According to Livy, a shower of stones fell on the Alban mount, not far from Rome, about 654 B.C. The fall of a great stone at Ægospotami, on the Hellespont, about 467 B.C., is recorded in the *Parian Chronicle* (q.v.), and mentioned by Plutarch and Pliny. It was still shown in the days of Pliny (d. 79 A.D.), who describes it as the size of a wagon, and of a burned color. In the year 1492 A.D., a ponderous stone, weighing 260 lbs., fell from the sky near the village of Ensisheim, in Alsace; part of it is still to be seen in the village church. An extraordinary shower of stones fell near L'Aigle, in Normandy, on the 26th April, 1803. The celebrated French philosopher, M. Biot, was deputed by government to repair to the spot and collect the authentic facts; and since the date of his report the reality of such occurrences has no longer been questioned. Nearly all the inhabitants of a large district had seen the cloud, heard the noises, and observed the stones fall. Within an elliptical area of seven m. by three, the number of stones that had fallen could not be less than two or three thousand; the largest were 17 lbs. in weight. These are only a few out of hundreds of instances on record.

As was natural with objects of such mysterious origin, meteoric stones have always been regarded with religious veneration. At Emesa, in Syria, the sun was worshipped under the form of a black stone, reported to have fallen from heaven. The holy Kaaba of Mecca, and the great stone of the pyramid of Cholula, in Mexico, have all the same history.

The existence of such bodies once admitted, led to assigning a meteoric character to strange ferruginous masses found in different countries, and which had no history, or were only adverted to in vague tradition. Of this kind is the immense mass seen by Pallas in Siberia, now in the imperial museum at St. Petersburg. The largest known is one in Brazil, estimated at 14,000 lbs.

One constant characteristic of meteoric stones is the fused black crust, like varnish, with which the surface is coated. From the circumstance of this coat being very thin, and separated from the inner mass by a sharply defined line, it is thought to indicate some rapid action of heat which has not had time to penetrate into the substance of the stone. This view is favored by the fact that the stones are found in a strongly heated but not incandescent state when they fall. Their specific gravity ranges from two to seven or even eight times that of water.—As to their chemical composition, the predominating element is iron, in a native or metallic state, generally combined with a small proportion of nickel. According to Humboldt, the A. that fell in the neighborhood of Agram, in Croatia, in 1751, the Siberian stone, and specimens brought by that philosopher from Mexico, contain 96 per cent of iron; while in those of Sienna the iron scarcely amounts to 2 per cent, and, in some rare instances, metallic iron is altogether wanting.

A writer in the *Quarterly Review*, No. CLXXXIII., thus sums up the result of all the chemical analyses hitherto made: "We find the actual number of recognized elements discovered in A. to be nineteen or twenty—that is, about one third of the whole number of elementary substances (or what we are yet forced to regard as such) discovered on the earth. Further, all these A. elements actually exist in the earth, though never similarly combined there. No new substance has hitherto come to us from without; and the most abundant of our terrestrial metals, iron, is that which is largely predominant in A., forming frequently, as in some of the instances just mentioned, upwards of 90 parts in 100 of the mass. Seven other metals—copper, tin, nickel, cobalt, chrome, manganese, and molybdena—enter variously into the composition of these stones. Cobalt and nickel are the most invariably present; but the proportion of all is trifling compared with that of iron. Further, there have been found in different A. six alkalies and earths—namely, soda, potash, magnesia, lime, silica and alumina; and, in addition to these, carbon, sulphur, phosphorus and hydrogen. Finally, oxygen must also be named as a constituent of many A., entering into the composition of several of the substances just mentioned. As respects the manner of conjunction of these elements, it is exceedingly various in different A. A few there are, especially examined by Berzelius and Rose, containing olivine, augite, hornblende and other earthy minerals, and closely resembling certain crystalline compounds which we find on the surface of the earth."

Besides those solid masses of considerable size, numerous instances are on record of showers of dust over large tracts of land; and it is remarkable that such dust has generally been found to contain small hard angular grains resembling augite. Stories of the fall of gelatinous masses from the sky are ranked by Humboldt among the mythical fables of meteorology. It has been supposed that such fables may have originated in the very rapid growth of gelatinous alga, as *Nostoc* (q.v.).

*Fireballs and Shooting-stars.*—From the height and apparent diameter, the actual diameter of the largest fire balls is estimated by Humboldt to vary from 500 to 2800 ft.; others allow a diameter of about a mile. Shooting-stars are much smaller, their weight varying from 30 grains to 7 lbs. In most cases of luminous meteors, a train of light many miles in length is left behind. One or two instances are on record where the train of the fireball continued shining for an hour after the body disappeared. The heights of shooting-stars are found to range from 15 to 150 m. at the points at which they begin and cease to be visible. Their velocities vary from 18 to 26 m. in a second. When it is remembered that the velocity of Mercury in its orbit is 26.4 m. in a second, of Venus 19.2, and of the earth 16.4, we have in this fact a strong confirmation of the planetary nature of meteorites.

One of the most remarkable facts connected with shooting-stars is, that certain appearances of them are *periodic*. On most occasions they are *sporadic*—that is, they appear singly, and traverse the sky in all directions. At other times they appear in swarms of thousands, moving parallel; and these swarms are periodic, or recur on the same days of the year. Attention was first directed to this fact on occasion of the prodigious swarm which appeared in N. America between the 12th and 13th of Nov., 1833, described by prof. Olmsted, of New Haven. The stars fell on this occasion like flakes of snow, to the number, as was estimated, of 240,000, in the space of nine hours, and varying in size from a moving point or phosphorescent line to globes of the moon's diameter. The most important observation made was that they all appeared to proceed from the same quarter of the heavens—the vicinity, namely, of the star  $\gamma$ , in the constellation Leo; and although that star had changed greatly its height and azimuth during the time that the phenomenon lasted, they continued to issue from the same point. It was afterwards computed by Encke that this point was the very direction in which the earth was moving in her orbit at the time. Attention being directed to recorded appearances of the same kind, it was observed with surprise that several of the most remarkable had occurred on the same day of Nov., especially that seen by Humboldt at Cumana in 1799, and by other observers over a great extent of the earth. The November stream was again observed in the U. S. in 1834, between the 13th and 14th, though less intense. Though often vague, and in some years altogether absent, this phenomenon has recurred with such regularity, both in America and Europe, as to establish its periodic character.

Another periodic swarm of considerable regularity is that appearing between the 9th and the 14th of Aug., and noticed in ancient legends as the "fiery tears" of St. Lawrence, whose festival is on the 10th of that month. There are other periodic appearances, and Humboldt gives the following epochs as especially worthy of remark: 22d to 25th of April; 17th of July; 10th of Aug.; 12th to 14th of Nov.; 27th to 29th of Nov.; 6th to 12th of December.

It remains to notice briefly the various opinions that have been advanced as to the origin of aerolites, and the theory of meteors in general. The hypotheses that have been formed in answer to the question—Whence come those solid masses that fall upon the earth?—are of two kinds; some ascribing to them a telluric origin, and others making them alien to the earth. Of the first kind is the conjecture that they may be stones ejected from terrestrial volcanoes, revolving for a time along with the earth, and at last returning to it. Another theory, which at one time found considerable favor, supposed that the matter of which aerolites are composed existed in the atmosphere in the form of vapor, and was by some unknown cause suddenly aggregated and precipitated to the

earth. These conjectures are untenable in the face of the facts of the phenomena stated above, and are now completely given up.

In seeking a source beyond the earth, the moon readily presented itself. Olbers was the first to investigate (1795) the initial velocity necessary to bring to the earth masses projected from the moon. This "ballistic problem," as Humboldt calls it, occupied, during ten or twelve years the geometricians Laplace, Biot, Brandes and Poisson. It was calculated that, setting aside the resistance of air, an initial velocity of about 8000 ft. in a second, which is about five or six times that of a cannon-ball, would suffice to bring the stones to the earth with a velocity of 85,000 ft. But Olbers has shown that to account for the actual measured velocity of meteoric stones, the original velocity of projection must be fourteen times greater than the above. It is against this lunar theory, that we have no proof of active volcanoes now existing in the moon; and with the improvement of the telescope, the probability of the contrary is increasing. It is, accordingly, giving place to the planetary theory, which we noticed at the outset—a theory which harmonizes better with the tendency of physical research and of speculation generally.

The discussion of hypotheses as to the genesis of the recognized planets out of portions of the gradually contracting vaporous mass of the sun; the continued discovery of hitherto unobserved planets between the orbits of Mars and Jupiter; the countless multitudes of comets that are observed traversing our system in all directions, and undergoing appreciable alteration both of consistency and orbit—all prepare us for the idea that matter may exist in the inter-planetary spaces, in every variety of form and condition. To account for the phenomena of meteors as above described, we must suppose that there are both detached masses, each revolving in an independent orbit, and giving rise to *sporadic* meteors; and also connected systems, forming rings or zones round the sun. The intersection of the earth's orbit by such zones or streams would account for the periodic swarms of meteors; and if we suppose the asteroids composing it to be irregularly grouped, we see a reason why the same stream should not be always of equal intensity. There may even be periodicity in this respect too. Between 1799 and 1823—two of the most brilliant manifestations of the November stream on record—there elapsed 34 years; and the next brilliant appearances were in 1866 and 1867, as Olbers had predicted.

What causes the luminous and ignited condition of *aërolites*? Terrestrial magnetism was at one time suggested as the exciting cause. It is now recognized, however, that the atmosphere extends, although in a very rare condition, to at least a height of 200 m., and the ignition is believed to be caused by friction between the rapidly moving body and the air. As to meteors unattended by *aërolites*, we may suppose that some are merely deflected from their path by the proximity of the earth, are rendered luminous through a short arc, and continue their course with altered orbit, while the greater part are soon burnt up and fall to the earth in impalpable dust. See METEORS.

**ÆRONAUTICS**, the art of navigating the air. See BALLOON.

**ÆEROPHYTES**. See EPIPHYTES, *ante*.

**ÆEROSTATIC PRESS.** This is a machine used for extracting the coloring-matter from dye-woods and such like. A vessel is divided by a horizontal partition pierced with small holes. Upon this the substance containing the color is laid, and a cover, also, perforated, is placed upon it. The extracting liquid is then poured on the top, and the air being drawn from the under part of the vessel by a pump, the liquid is forced through the substance by the pressure of the atmosphere.

**ÆEROSTATICS.** This branch of science treats of the equilibrium and pressure of air and other gases, and of the methods of measuring it by the barometer and other instruments. The expansive force or pressure of atmospheric air varies with time and place. In a medium condition of the atmosphere, and near the sea-level, barometrical observations give the pressure or weight equal to that of a column of mercury, 30 inches high, or of a column of water about 34 feet high. This makes the mean pressure of the atmosphere nearly 15 lbs. on every sq. in. This mean pressure of the atmosphere is generally taken as the unit or measure of expansive or elastic forces generally; any particular pressure is said to be equal to so many atmospheres. A. also investigates the phenomena of the compression of gases; in other words, the relation between the elasticity and the density or volume of a gas. According to the law of Mariotte, the expansive force of one and the same body of gas is proportional to its density; or, which is the same thing, the expansive force of a body of gas under different degrees of compression varies inversely as the space which it occupies. If its elastic force, at one stage, be measured by 50 lbs., when compressed into half the space that force will be 100 lbs. Connected with this is the investigation of the variation of density and pressure in the several vertical strata of the atmosphere. It is obvious that the weight of the atmosphere must diminish as we ascend, as part of it is left below; and it results from Mariotte's law that, at different distances from the earth's surface, increasing in arithmetical progression, the atmospheric pressure diminishes in geometrical progression. This principle furnishes the means of measuring heights by the barometer (*q.v.*).

The elastic force of air and other gases is very much increased by heat, and, consequently when allowed, they expand. It is found that a rise of temperature of 1° of Fahrenheit causes any gas to expand  $\frac{1}{480}$  of its own bulk; and this expansion is uniform.

If adding  $10^{\circ}$  to the temperature of a body of gas increases its bulk 3 cubic in., an addition of  $20^{\circ}$  will give an increase of 6 in.; of  $50^{\circ}$ , 15 in., and so on. This law was discovered by Gay-Lussac, and has been verified by subsequent investigators. Both it, however, and that of Mariotte, can be looked upon as only nearly true, and that within certain limits.

**ÆSCHEINES**, an Athenian orator, second only to Demosthenes, whose contemporary and rival he was. Philip of Macedon was then pursuing his designs for the subjugation of the several Greek states to his own sway; and while Demosthenes advocated the policy of opposing him before it was too late, Æ. was the head of the peace-party. Æ. was a member of more than one embassy sent by the Athenians to deal with Philip; and Demosthenes accused him of receiving bribes from the Macedonian monarch, and of betraying the cause of Athens and of her allies. There is no proof that this was the case; and perhaps Æ. was deceived by the wily Philip into believing that he meant no harm to the liberties of Athens, and that peace was the best policy for his countrymen. The result justified the sagacious fears of Demosthenes, and condemned the selfish, isolating policy of Æ. When it was proposed to reward Demosthenes with a golden crown, for his patriotic exertions in defense of his country, Æ. brought an accusation of illegality against the proposer, Ctesiphon. Demosthenes replied, and Æschines being vanquished, and having thus incurred the penalty attached to an unfounded accusation, was obliged to retire from Athens. He finally established a school of eloquence in Rhodes, which enjoyed a high reputation. On one occasion, he read to his audience in Rhodes his oration against Ctesiphon; and some of them expressing their astonishment that he should have been defeated in spite of such a powerful display, he replied: "You would cease to be astonished if you had heard Demosthenes." The oration against Ctesiphon and two others are the only authentic productions of Æ. that have come down to us. He was b. 389 B.C., and d. at Samos 314 B.C.

**ÆSCHYLUS**, the father of Greek tragedy, was b. at Eleusis, in Attica, 525 B.C. We have but scanty notices of his life. He fought in the battles of Marathon, Salamis, and Platæa, witnessed the fall of Darius and Xerxes, and shared in the exulting sentiments which afterwards pervaded liberated Greece. Of the seventy or ninety tragedies ascribed to Æ., only seven have been preserved—*Prometheus Bound*, the *Seven against Thebes*, the *Persians*, *Agamemnon*, the *Choëphori*, *Eumenides*, and the *Suppliants*. These are sufficient to prove that Æ. was the creator of the Greek drama in its higher form. He introduced action in place of the perpetual chorus, and dramatic dialogue to supersede the long narrations of his predecessors Thespis and Choerilus. Scenic effects, masks and dresses were other improvements introduced in the plays of Æ. The plots of his pieces are very simple, and display no ingenuity of construction or solution. His general tone is elevated and earnest, and shows a preference of strong to gentle emotions. Destiny is represented in its sternest aspect; gigantic heroes, Titans, and gods rather than men, appear on the scene, and the lofty grandiloquence of the language is in accordance with the characters. In the choruses, the language is often turgid and obscure. For some reason, not well known, Æ. left his native city, and went to Sicily, where he was honorably received by king Hiero. Here he died at Gela, 456 B.C., and the inhabitants of the city raised a monument to his memory. In the poetical translation by Blackie, the non-classical reader may get a very tolerable notion of the grandeur and fire of this greatest of all ancient dramatists.

**ÆSCULAPIUS** appears in Homer as an excellent physician, of human origin; in the later legends, he becomes the god of the healing art. The accounts given of his genealogy are various. According to one story, he was the son of Coronis and the Arcadian Ischys. Apollo, enraged by the infidelity of Coronis, caused her to be put to death by Diana, but spared the boy, who was afterwards educated by Chiron. In the healing art Æ. soon surpassed his teacher, and succeeded so far as to restore the dead to life. This offended Pluto, who began to fear that his realm would not be sufficiently peopled; he therefore complained to Jove of the innovation, and Jove slew Æ. by a flash of lightning. After this he was raised to the rank of the gods by the gratitude of mankind, and was especially worshipped at Epidaurus, on the coast of Laconia, where a temple and grove were consecrated to him. Here oriental elements, especially serpent-worship, seem to have been mingled with the rites and ceremonies. From Epidaurus the worship of the healing god extended itself over the whole of Greece, and even to Rome. According to Homer, Æ. left two sons, Machaon and Podalirios, who, as physicians, attended the Greek army. From them the race of the Asclepiades descended. Hygieia, Panacea, and Ægle are represented as his daughters. His temples usually stood without the cities in healthy situations, on hillsides, and near fountains. Patients that were cured of their ailments, offered a cock or a goat to the god, and hung up a tablet in his temple, recording the name, the disease and the manner of cure. Many of those votive tablets are still extant. The statue of the god at Epidaurus, formed of gold and ivory by Thrasymedes, represented Æ. as seated on a throne, and holding in one hand a staff with a snake coiled round it, the other hand resting on the head of a snake; a dog, as emblem of watchfulness, at the foot of the deity. Praxiteles and other sculptors represented the god as an ideal of manly beauty, and closely resembling Jupiter; with hair thrown up from the brow, and falling in curls on each side. The upper part of the body was naked,

and the lower was covered by a mantle falling in folds from the shoulders. He had sometimes a laurel-wreath on his head, and a cock or owl at his feet; or was attended by a dwarf-figure named Telesphorus.—ASCLEPIADES, the followers of Æ., who inherited and kept the secrets of the healing art; or, assuming that Æ. was merely a divine symbol, the Asclepiades must be regarded as a medical, priestly caste who preserved as mysteries the doctrines of medicine. The members of the caste, or medical order, were bound by an oath—the *Hippocratis iuramentum*—not to divulge the secrets of their profession. In Rome, 293 B.C., when a fatal pestilence prevailed, the Sybilline books commanded that Æ. must be brought from Epidaurus. Accordingly, an embassy was sent to this place, and, when they had made their request, a snake crept out of the temple into their ship. Regarding this as the god Æ., they sailed to Italy, and, as they entered the Tiber, the snake sprang out upon an island, where, afterwards, a temple was erected to Æ., and a company of priests appointed to take charge of the service and practice the art of medicine. Hippocrates is said to have descended from the Asclepiades of Cos, who traced their descent, on the mother's side, from Hercules.

ÆSIR (plural of AS, or "god"), the gods of the northmen of Scandinavia and Iceland. There were twelve chief gods or Æ., besides Odin (the "all-father"), viz.: Thor, Baldur, Niord, Frey, Ty, or Tyr, Bragi, Heimdal, Höd, Vidar, Ull, Forseti, and Loki, or Lopt. The chief goddesses of Asgard, the Scandinavian Olympus, were: Frigg, Freyja, Nanna, Sif, Sagu, Hel, Gefion, Eir, Hlin, Lofn, Vor, and Snotra. These names, considered in the primary old Norse signification of the words, in most instances allude to some characteristics; yet it is impossible to determine whether they personify merely certain physical powers of nature, or were originally the names of individuals in the prehistoric period. Probably they have a mixed origin, and combine real names with physical powers. The principal source of information concerning these gods is the "Edda" (see *ante*), a collection of the oldest songs and traditions of the people of Scandinavia. Thor, the son of Odin and Frigg ("the vivifying"), is the strongest of the Æ. He seems to have been a god of that Phœnician form of nature worship which was superseded in Scandinavia and northern Germany by the faith of Odin. From Thor's hammer flashed lightning, and his chariot wheels made thunder as he went through the air, cleaving mountains, loosening frozen streams and pent-up rivers, and slaying giants and monsters. He was seldom in Asgard with the other Æ., but dwelt in his mansion Bilskirner, in the densest gloom of the clouds. With his hammer he consecrated the newly wedded, and the sign of the hammer was made by Northmen when they took an oath, or any serious obligation. The early Christian missionaries in Scandinavia, finding the faith in Thor too strong to be suddenly uprooted, tried to transfer many of his characteristics to their zealous convert, St. Olaf, who was said to have resembled the old Norse god in his comeliness of person, his bright red beard, hot angry temper, and personal strength; while some of the monks of a later period tried to persuade the Northmen that in Thor their forefathers had worshipped Christ, and that his mallet was a rude image of the cross. Slaves and thralls killed in battle were believed to be under the protection of Thor, who, as the god of the Finns before the spread of the Asa religion, was honored as their special guardian against the tyranny of their old masters. In Baldur the Norsemen honored the beautiful, the eloquent, the wise and the good, and he was the spirit of activity, joy and light. His name signifies the "strong in mind." His wife Nanna reflected these attributes in a less degree. On his life depended the activity and happiness of all the Æ., except Loki, the "earthly fire" or incarnation of evil; and hence Loki, from envy of the beauty and innocence of Baldur, accomplished his death, and afterwards hindered his release from the power of Hel, the goddess of death. As the death of Baldur was to be followed by the fall of all the Æ., the gods had caused all things to swear not to injure him. But the insignificant mistletoe was overlooked or thought unimportant. Loki secured an arrow of mistletoe, and when the gods were amusing themselves by shooting at the invulnerable Baldur, Loki gave this arrow to Höd, the blind god, and directed his aim so as to hit Baldur, who was killed. The death of this beneficent god signifies the fading of summer before the blind and fierce winter, her preordained destroyer. The myth continues: After Baldur's death, the gods captured Loki and shut him in a mountain, where he will remain until the earth and all therein and the gods themselves will be destroyed by fire (the powers of evil), the companion and liberator of Loki. Odin alone will survive, and then a new and purer world will arise in which Baldur will again appear, and Loki, or evil, be no more heard of. In the beginning of time, Loki, under the name of "Lodthurr," or "flame," and as the foster brother of Odin, had united with the all-father in imparting blessings to the universe. Afterwards he left the council of the gods, and wandered into space, desolating and consuming with flame all things that came in his way. In the under-earth, where volcanic fires attest his presence, he consorted with evil giantesses and became the father of Hel, "pallid death," of Angurboda, "announcer of sorrow," the wolf Fenrir, and the Midgard serpent, who ever threaten the destruction of the world. Loki assumes any shape at will. As sensuality he courses through the veins of men, and as heat and fire pervades nature and causes destruction. After the establishment of Christianity the attributes of Loki were transferred to satan; but in Iceland an *ignis fatuus* is still known as "Loki's burning." Niord and his children Frey or Frizzo, and Freyja appear to have been honored in the

north before the time of Odin. Niord is said to have lived in Vanaheim, and to have ruled over the Vanir, or elves of light, long before he became one of the Æ. He is the god of oceans and controller of winds and waves, and to him sea-farers and fishermen raise altars and make prayers. Frey, his son, is the god of rain and fruitfulness, and his worship was accompanied with phallic rites. His sister and wife, Freyja, who holds a high rank among the Æ., is the goddess of love, but her influence, unlike her husband's, is not always beneficent, and varies with the form she assumes in operating on the minds of men. Her chariot is drawn by cats, who are emblems of fondness and passion; and a hog, implying fructification or sensual enjoyment, attends upon Frey and herself. The Swedes paid especial honor to Frey, while the Norwegians worshiped Thor. Ty or Tyr was the Mars of the Norsemen. He is wise and brave, and gives victory, but he foments strife. His name lives, in our Tuesday (Ty's day), and so does the name of Odin in Wednesday (Woden's day), Thor in Thursday (Thor's day), and Frey and Freyja in Friday, (Frey's day). Tyr's name signifies "honor," and his worship was widely spread in the north. Bragi, the god of eloquence and wise sayings, lives in our word "brag," to speak extravagantly; for when men drank Bragi's cup they vowed to perform some great deed worthy of a skald's song. At guilds and grave-feasts this Bragi cup was drunk; and at the funerals of kings or jarls the heir was not permitted to take the official place till "bragarfull" was brought in, when, rising to receive it, he drank the contents of the cup and was led to the high seat of honor. Bragi's wife was Idun, who guarded the casket of apples that gave to those who ate them perpetual youth. She was abducted by the giant Thiaasi, and by Loki's craft removed to the other world. Her release in spring seems analogous to the myth of Proserpine. Heimdall, personified by the rainbow, is the god of watchfulness, the doorkeeper of the Æ. Vidar, the strongest of the gods except Thor, is the personification of silence and caution. Ull decides issues in single combat; Forseti settles all quarrels; lovers find protection in the goddesses Lofn and Vor, of whom the former unites the faithful and the latter punishes the faithless; Gefion keeps a watch over maidens, and knows the decrees of fate; Hlin guards those whom Frigg, the queen and mother of heaven, desires to free from peril. The queen herself, as Odin's wife and mother of the Æ., knows but does not reveal the destinies of men. As goddess of the earth she is known as Frygga, the "fertile summer earth," and as Rinda, the "frost hardened surface." Saga is the goddess of narration and history; her home is in Sockquabek, the abyss, an allusion to the abundant streams of narrative, from which streams Odin and Saga daily drink and pledge each other. Snotra is the goddess of sagacity and elegance, from whom men and women seek good sense and refined manners. The Norns and the Valkyrias are closely connected with the gods. The principal Norns are Urd, past time; Verdandi, present time, and Skuld, future time. They and the Valkyrias twist and spin the threads of destiny, and make known what has been decreed from the beginning of time. In the gods here mentioned the Northmen recognized the makers and rulers of the world that now is, from whom emanated the thought and the life that pervades and animates nature. With Odin and the Æ. the intellectual life of the northern people began; and although they ascribed to them human forms and acts, these were seldom without something higher and nobler than pertains to mortals; and while they recognized the existence of a state of chaos and darkness before the world began, they anticipated the advent of another state, in which the gods, like men, would receive their reward at the hands of a supreme All-father. (See *ÆSES*, ante.)

**ÆSOP**, an ancient Greek writer, whose name is attached to the most popular of the existing collections of fables. His history is very uncertain, and some critics have even denied his existence. First among these is Luther, in his preface to the *German Æsop*, 1530. We are told, however, on the authority of Herodotus (ii. 134), Diog. Laertius (i. 72), and Plutarch (*Sept. Sap. Conviv.*, and *De Sera Num. Vind.*), that Æsop lived in the latter half of the 6th c. B. C.; that he was a slave at Samos; that, on receiving his freedom, he visited Cræsus and Pisistratus, by the former of whom he was commissioned to distribute some money among the citizens of Delphi, and that on his refusal to pay it, in consequence of a dispute, he was thrown over a precipice by the infuriated mob. We are further informed that the Athenians erected a statue to him from the chisel of Lysippus. Whether this person was the author of the existing Æsopian collection or not, we know, from Aristophanes, and other authorities, that fables bearing his name were popular in the most brilliant period of Athenian literature. The conjecture of Bentley, however, seems well founded, that these fables were transmitted entirely through oral tradition. Socrates (*Phædo*, p. 61) turned such of them as he could remember into verse, of which Diog. Laertius has preserved a specimen; and the same was done by Demetrius Phalereus, 320 B. C. The only Greek version, however, of which any entire fables remain, and which, as shown by Bentley, has furnished materials to subsequent collections, is that of Babrius (q. v.), a writer of some mark, who is supposed to have lived in the age before Augustus. Of the fables now bearing the name of Æsop, there are three sets, the first from a MS. of the 13th c., published at Florence in 1809; the second a collection by Maximus Planudes, a monk of the 14th c., containing a life (supposed to have been the work of Planudes, till it was found in the earlier MS.) of Æsop, full of fabulous particulars; and the third a collection published in 1610, from MSS. found at Heidelberg. All these are contained in the edition of Schneider, Breslau, 1810. The resemblance between some of the fables

and the personal peculiarities attributed in common to Æsop and to the Arabian fabulist Lokman, have led some persons to conclude that the two men were identical; and others, that the fables attributed to them in common belong to the same eastern source. (See PHÆDRUS.)—A Roman actor of this name, CLAUDIUS ÆSOPUS, a contemporary and friend of Cicero, was as eminent in tragedy as Roscius was in comedy.

ÆSOP, CLODIUS, a Roman actor contemporary with Roscius, excelling in tragedy. Cicero put himself under the direction of those two to perfect his own acting, and Æ. did many friendly services to Cicero during the latter's banishment. Æ. was noted for sinking his own personality in the character he represented. He made his last appearance in 55 B.C. at the dedication of Pompey's theater, after which his voice failed him. He left a fortune to a worthless son—the Æ. who dissolved a pearl valued at \$40,000 in vinegar to have the satisfaction of swallowing the most expensive drink ever known.

ÆSTHETICS, a term invented about the middle of last c. by Baumgarten, a professor of philosophy in the university of Frankfort-on-the-Oder, to denote the science of the beautiful, particularly of art, as the most perfect manifestation of the beautiful. It has the merit of being at once comprehensive and clear, and has therefore been pretty widely adopted, of late years, by critics both in France and England.

The beautiful (Gr. *to kalon*) was a favorite subject of contemplation amongst the ancients. The name of Plato is inseparably associated with it, but in his philosophizings he nowhere separated the beautiful from the good. Aristotle, again, from the immense acquaintance which he possessed with objects of art, deduced the most admirable laws and rules (canons of criticism), so that his *poetics*, according to Schiller, constitute a true rhadamanthine tribunal for poets. But the results he arrived at are regarded by the *a priori* school of æstheticians as empiricism rather than science. Baumgarten they hold to be the first who considered the subject from the true scientific point of view, and therefore entitled to be called the founder of the philosophy of art. All sensuous apprehension, not in one form or manifestation only, but in every possible form or manifestation, was included in his view of the subject, and this conception he expressed by the word *æsthetics*, from the Greek *aisthanomai*, I feel, indicating not absolute or objective knowledge of things, but such as is conditioned subjectively by the play of our sensibilities. The term is thus not confined to the limits of the beautiful, though in point of fact we employ it in this partial signification. Beauty was, with Baumgarten, the result of the highest and purest æsthetic perception, to the realization of which the finer portion of our nature aspires; and to trace which through the whole sphere of art was the work of æsthetic philosophy (*sinnenerkenntnis*). Kant subsequently, from his point of view, carried out this theory of the æsthetic faculty in his critical treatise on the power of the judgment. Everything he conceived may be regarded æsthetically as well as absolutely, in reference to ourselves as well as in reference to nature. An object may be in harmony with our sensibilities, as well as in harmony with the totality of material phenomena; or it may not be in harmony with the former, and yet truly accord with the latter. So, too, with the judgment. It may choose to apprehend things in their adaptation to man, or in what is called the teleological point of view—that is, their final end or objective adaptation to each other. Hence the æsthetical judgment considers objects as beautiful, agreeable, or useful; while the teleological judgment strives to reach their absolute design, and remains indifferent to personal predilections. Why certain objects excite in us a purely selfish interest, and others a purely unselfish pleasure, Kant does not venture to determine, for he never investigates the objective quality of the beautiful, but confines himself strictly to its influence upon the feelings and desires. Schelling was the first to undertake this inquiry after Schiller had paved the way for him in his treatise on æsthetics. The latter, perhaps the most lucid and intelligible of German æstheticians, in a note to his twentieth letter on æsthetic culture, explains his conception of the new science as follows: All things that can ever be objects of perception may be considered under four different relationships. A fact can relate directly to our sensuous condition—that is its physical quality; or to the understanding—that is its logical quality; or to the will—that is its moral quality; or to the entirety of our different powers, rather than to any particular manifestation of these—that is its æsthetic quality. There is a culture for the health, for the understanding, for morality, and for taste or beauty; the last of which has for its design to bring out the totality of our sensuous and spiritual powers in their greatest possible harmony. Schiller's idea of the beautiful is necessarily as comprehensive as his conception of the sphere of Æ. He will not admit that it is the result of a mere limited experience, taught us through the operation of phenomena, animate and inanimate, on our senses, but of pure abstract reflection. It is, therefore, a transcendental idea. It originates in the perfect union of matter and spirit. From this it follows, that "beauty can be exclusively neither mere *life*, as some ingenious observers have maintained, nor mere *form*, as has been decided by some speculative philosophers and philosophizing artists" (for instance, Burke and Raphael Mengs).

Passing over Schelling's transcendental speculations, which are couched in a style not very intelligible to the English mind, we come to the theory of Hegel. Like that of Schelling, it also proceeds from the so-called metaphysics of the beautiful. It is the absolute ideal realizing itself. Nothing is truly beautiful except this. Nothing, therefore, which exists can be termed such. Out of the sphere of the pure reason

we have only an eternal aspiration. In the finite mind, the absolute ideal is always striving to realize itself, but never completely succeeds. There is only a ceaseless approximation. Hegel then traces the growth and development of the beautiful, the first form of whose existence is *natural* beauty, and, as Vischer justly adds, the beauty unfolded in history. But this beauty, whether of nature or history, is rare, accidental, fugitive, and tarnished by intermixture with the not-beautiful. This deficiency or limitation arises from its being unconscious of itself. The beautiful is, so to speak, as yet in its infancy. It does not know either that it is or what it is. It first passes into self-recognition in the dawn of human intelligence, and its conscious realization of itself increases in proportion to the culture of the race or the individual. The highest finite realization of it is art; for though the form of art be material, it is matter shaped according to an idea. The artist looks on the form simply as the objective embodiment of the idea—every remnant of rude nature being stripped off. Form, though springing out of matter, is thus a deliverance from matter, and the particular arts may consequently be regarded as the gradual working of the mind out of materialism. The formative arts—architecture, sculpture, painting—are silent, heavy, still partly material. Music is an advance on these. It breathes in a higher region. The materialism of sound becomes all but ideal. Poetry is a further advance. It is the pathway of the intellect to pure thought. Æsthetics, in this point of view, is a science, based on a knowledge of the historic development of the beautiful. It wanders through its whole kingdom, of which art is only a province, though, as has been seen, the richest and most valuable.

Such was the aspect in which Hegel regarded the new science. He fused it into his historico-transcendental metaphysic, and so stirred up regarding it the old quarrel which had agitated the latter. Realists made their appearance, who vigorously assailed the principles of Fichte, Schelling, and Hegel, in their various applications to philosophy, theology and Æ. The reaction was and is most conspicuous in the second of these, but has as certainly manifested itself in the others also. It is denied that the ideal conceived by man is superior to the real, as it is in itself. It is man who lowers it by his inadequate apprehension of its harmony and perfection. The greatest artist does not strive to outshine or even to reach the beauty of nature, but to surpass himself in it. The whole historic theory of Hegel is likewise rejected, after severe and searching criticism, from a rationalistic point of view. Hegel conceives the first efforts of art to have arisen from a longing on the part of the human spirit to emancipate itself from the thralldom of matter. This is the idealistic view of its beginning. Kugler, on the other hand, affirms that it arises from "the necessity which man is under to bind his thoughts to one firm spot, and to give to this memorial a form which may be expressive of the thought." The origin of art is thus made retrospective, not prospective. This may be considered the realistic view of its beginning. So the question stands at present in Germany.

In France, the founder of the eclectic school of philosophy, Victor Cousin, has eloquently expounded the Platonic view of Æ. In the second part of his treatise *Du Vrai, du Beau, et du Bien* (on the true, the beautiful, and the good), he has a chapter on "the beautiful in objects," in which, after discussing the principal theories of the materialists and geometricians, and pointing out what he conceives to be the errors and limitations of such theories, he proceeds to a consideration of physical, intellectual and moral beauty, endeavors to discover the quality or qualities in which they agree, from this rises to the apprehension of an ideal beauty whose realization he finds in God. "God," says Cousin, "in whom is combined absolute unity with infinite variety, is necessarily the realized ideal of all beauty."

Speculations on this subject in Britain have been mostly limited to the beautiful in form and color. We have not in general sought, like the Germans, to discover the *idea* of the beautiful, but the beautiful itself. Our criticism may and indeed does seem meager and unphilosophical to them, but it is at least clear, and its purpose obvious. We have put to ourselves this question: Are there, or are there not, constant qualities in certain objects which make them what we call beautiful? Does beauty arise from anything inherent in these, or does it depend upon accidents in us, such, for instance, as the complex and numberless phenomena of association? Is it objective or subjective?

The first publication on this subject of any consequence—if we except Lord Shaftesbury's *Characteristics*, in which there is set forth a "rapturous Platonic doctrine" impossible to criticise, because unintelligible—was Dr. Hutcheson's *Inquiry*, 1725. In this work, the existence of an "internal sense," through which we either obtain a perception of the beautiful or are made in some way conscious of its presence, was maintained. The notion of a sixth sense has been very severely criticised by Jeffrey in his celebrated article on beauty.

Certain explanations and modifications of this theory were made by the followers of Hutcheson, but nothing really new was brought out till Edmund Burke published his *Treatise on the Sublime and the Beautiful*, 1756. There is no work upon the subject so popular or so worthless. Every one has heard of it, large numbers have read it, and yet the fundamental principle is weak and absurd. He confounds the beautiful with the luxurious. "All objects appear beautiful which have the power of producing a peculiar relaxation of our nerves and fibres, and thus inducing a certain degree of bodily languor and sinking!"

Sir Joshua Reynolds, a contemporary of Burke, maintained a very remarkable theory

of the beautiful, which he borrowed from the celebrated Père Buffier, and illustrated at great length. Beauty was conceived to be the mean between two extremes. This doctrine is open to the fatal objection that the most ordinary is therefore the most beautiful, and that, consequently, the greatest poem or the finest landscape must be that which is the most commonplace. Nevertheless, Sir Joshua does not hesitate to push his theory to extremities, declaring that if what we term the deformed or monstrous were only more common than what we call the beautiful, they would exchange names and sensations—a statement which may safely be left to refute itself.

The next work on this subject that excited any measure of popular attention was Alison's *Essays on the Nature and Principles of Taste*, 1790. The theory propounded by this writer is generally known as the theory of association. The most powerful exposition of the association theory is that given by Jeffrey, in his famous article in the *Encyclopædia Britannica*, and in his critique on Alison in the *Edinburgh Review*, 1811. According to Jeffrey: "These emotions (that is, those excited by the contemplation of certain objects) are not original emotions, nor produced directly by any qualities in the objects which excite them; but are reflections or images of the more radical and familiar emotions to which we have already alluded, and are occasioned not by any inherent virtue in the objects before us, but by the accidents, if we may so express ourselves, by which these may have been enabled to suggest or recall to us our own past sensations or sympathies." In his defense of this theory, Jeffrey is obliged to consider those of Stewart and Payne Knight, the former of which is partly, and the latter entirely, opposed to his own. So long as he confines his argument to association in connection with *landscapes*, it seems very conclusive; but when he comes to combat Payne Knight's doctrine as to the intrinsic beauty of colors, it ceases to be satisfactory. This writer maintains that colors possess a primitive and original beauty, which may be enriched by association, but which does not depend upon it. Jeffrey denies this, and attempts to prove that our perception of the beauty of color, instead of being a "mere organic sensation," arises from association alone. In the same way, he refuses to believe that there is any independent or intrinsic beauty in form; and conceives that architecture owes its beauty not to the essential harmony of its proportions, but to a variety of curious considerations on our part. He considers Alison's analysis of this beauty, with special reference to Greek architecture, "perfectly satisfactory." It arises, 1, from the association of utility; 2, of security; 3, of the skill of the architect; 4, of magnificence; 5, of antiquity; 6, of Grecian greatness! To this it may be replied, that such associations *increase*, but do not *create*, our perception of the beauty of Greek architecture.

The theory of association in this its primitive nakedness cannot be said to be held now by any who think on the subject. It is felt to be more plausible and ingenious than sound or adequate. Ruskin, prof. Blackie, and others have nearly destroyed its popularity. Prof. Blackie's three essays on beauty, which are remarkable for the brisk and biting humor with which they assail the association theory, as well as for the passages of fine eloquence which they contain, make a vigorous effort to indoctrinate the Saxon brain with the ideal speculations of Plato. Prof. Blackie is a Platonist in theory, but the elaboration of that theory is entirely modern and original. "Beauty," he says, "does not consist in one element, or in one power, or in one proportion, but in many elements, powers and proportions;" the principal of these are—order, congruity (or harmony), actuality, perfection (in the Platonic sense—viz., the full result of a creative energy), expressiveness, smoothness, delicacy, and curvature. With reference to this last principle, prof. Blackie points to the fact that nature everywhere avoids angular lines, especially in the human figure, and most of all in the sex which has ever been considered the highest symbol of the beautiful. In the second volume of his *Lectures on Metaphysics*, the late Sir William Hamilton (lecture 46th) distinguishes beauty into absolute and relative. "In the former case," he says, "it is not necessary to have a notion of what the object ought to be before we pronounce it beautiful or not; in the latter case, such a previous notion is required. Flowers, shells, arabesques, etc., are freely or absolutely beautiful. We judge, for example, a flower to be beautiful, though unaware of its destination, and that it contains a complex apparatus of organs all admirably adapted to the propagation of the plant. When we are made cognizant of this, we obtain, indeed, an additional gratification, but one wholly different from that which we experience in the contemplation of the flower itself apart from all consideration of its adaptations." Sir William thus states his theory of free or absolute beauty: "In the case of beauty—free beauty—both the imagination and the understanding find occupation; and the pleasure we experience from such an object is in proportion as it affords to these faculties the opportunity of exerting fully and freely their respective energies. Now, it is the principal function of the understanding, *out of the multifarious presented to it, to form a whole*. Its entire activity is, in fact, a tendency towards unity; and it is only satisfied when this object is so constituted as to afford the opportunity of an easy and perfect performance of this its function. In this case, the object is judged beautiful or pleasing." Sir William concludes by defining the beautiful to be that "whose form occupies the imagination and the understanding in a free, full, and, consequently, an agreeable activity." One of the best modern writers on Æ. is the French critic Taine (q. v.).

There would seem, on the whole, to be a tendency at present towards an amalgama-

tion of what have hitherto been considered irreconcilable doctrines—towards the belief that there is an essential beauty in the harmony of forms and in the combination of colors, and that the keen delight which we experience in beholding them is incapable of being explained by any number of associations; while it is admitted, on the other hand, that many things are made beautiful by association, that all things have their beauty enriched by it, and that some things even have their intrinsic beauty called forth by it operating in the form of *suggestion*.

**ÆSTIVATION**, in botany (from the Lat. *æstivus*, belonging to summer), a term employed to denote the manner in which the parts of the flower are disposed in the flower-bud prior to its opening. Sometimes the *Æ.* is *valvate* or *valvular*, when the parts of the same verticil exactly meet together by their edges, like valves. But if the edges are turned in, the *Æ.* is *induplicate*; if they are turned out, it is *reduplicate*. In many flowers, the *Æ.* is *contorted* or *twisted*; sometimes it is spirally *imbricated*. In pentamerous flowers, it is very generally *quincunxial*, two of the parts being external, two internal, and one intermediate. In papilionaceous flowers (q. v.), the other parts of the corolla are generally included in the standard or vexillum, and this is sometimes called *æcillary* *Æ.* In poppies, the petals are generally crumpled together before flowering. The *Æ.* of the calyx is frequently of a different kind from that of the corolla. Thus, in *geraniaceæ*, the *Æ.* of the calyx is imbricated, that of the corolla twisted. The manner in which the stamens and pistils are disposed in the bud is not so much taken into account in the characters of orders and genera, but is sometimes also noticed; thus, it is a character of *rosaceæ* that the stamens are curved inwards in *Æ.*

**ÆTHRIOSCOPE**, an instrument to measure degrees of cold produced by radiation towards a clear sky; useful in determining the amount of moisture present in the upper and inaccessible strata of the atmosphere.

**ÆTION**, a Greek painter supposed to have lived in the 2d c. He was famous for beauty of coloring. Lucian describes his picture of the "Marriage of Alexander and Roxana."

**ÆTIUS**, called "the atheist," lived in the 4th c. He favored the Arians, and was banished by Constantine. He was a slave in early life; studied medicine and theology at Antioch; became a deacon, and developed the doctrines called the *Ætian* heresy. He was made bishop by Julian, but late in life fell into immorality, and died without honor. His followers were called *Ætians*.

**ÆTIUS**, a Roman general, b. near the end of the 4th c. He long defended Gaul from the barbarians; with Theodoric, he compelled Attila to raise the siege of Orleans; he followed the Huns to the plain of Chalons, where a great but indecisive battle was fought, in which 300,000 men are said to have been slain. The emperor Valentinian became jealous of A., and slew him with his own hand, 454 A.D. An extant coin has the legend, "Ætius Imperator Cæsar," which indicates that A. had seized or meant to seize the empire.

**ÆTNA**. See *ETNA*, *ante*.

**ÆTOLIA**, a district of ancient Greece, lying on the n. coast of the gulf of Corinth. The ancient *Æ.* was divided from Acarnania by the river Achelous, and extended as far as the river Euenos. On the e. it was bounded by Locris and Doris; on the n. by Thessaly and Epirus; on the w. by Acarnania; and on the s. by the bay of Corinth. In later times these boundaries were considerably extended to the n. and e. The country had few cities, was generally wild and barren, and, according to Herodotus and Aristotle, was infested by lions on the banks of the Achelous and in other places. Here, according to the legend, Meleager slew the Calydonian boar (q. v.). The *Ætoli*ans make a great figure in the heroic age of Greece; but at the time of the Peloponnesian war, they were rude and barbarous. The *Ætolian* confederacy, first called into existence by the Lamian war (323 B.C.), became more important in the time of the *Achæan* league (q. v.). The several states assembled annually in autumn at Thermum. This assemblage was styled the *panætolieon*. At first they called in the aid of the Romans against the *Achæan* league; but as they saw that the Romans had designs against the independence of *Æ.*, they next allied themselves with Antiochus of Syria, afterwards with Perseus of Macedonia. In 189 B.C., they were compelled to share the fate of Macedonia, and were subjugated by the Romans.—*Æ.* now forms a governmental department, or nome, of the modern kingdom of Greece. The mountains in the n.e.—now styled *Vien*a—form a wild offset of the Pindus chain, and slope steeply on the s.w. down to the central plains, partly covered with morasses and partly cultivated. S. of the lakes Apokuro (anciently, *Trichonis*) and *Zygos* (*Hyria*) rise a range of mountains—the *Aracynthus* mountain of the ancients—which fall on the s.w. to a broad coast-level, occupied by morasses and lagoons; but on the s.e. side extend to the gulf, where the promontory of Antirrhion reaches to within 2400 yards of the opposite cape Rhion, thus forming the strait of Lepanto (*Naupactus*). The chief rivers of *Æ.* are the *Aspropotamo* (Achelous), in the w., and the *Fidas* (*Euenos*), in the e. The people in the plains are employed in agriculture and fishing; while in the mountain districts some traces of the rude and martial character of ancient *Æ.* may still be found. The chief towns are Missolonghi and Lepanto (q. v.).

AFANASIEFF, ALEXANDER NIKOLAEVITCH, 1826-71; author of popular tales or folk-lore of the Russian people. He wrote *Poetic Views of Nature entertained by the Ancient Slavs*, and contributed largely to current literature.

A FER, DOMITIUS, a Roman orator, teacher of Quintilian; b. in Gaul 15 B.C., died 60 A.D. He was made a consul by Caligula.

**AFFIDAVIT**, an oath in writing, or a written declaration made before a magistrate, or other person legally authorized to administer an oath, the truth of which is confirmed either by an oath sworn, or a solemn affirmation emitted in terms of 18 Vict. c. 25, and the other statutes referred to under AFFIRMATION. Where evidence is required in England to be laid before a court or a judge, it is usually reduced to the form of an A., in place of being delivered orally, as in jury trial. An A. ought to set forth the matter of fact only, and not to declare the merits of the cause, of which the court is to judge (21 Car. I. B. R.). The name and designation of the party making the A. are written at length, and he signs it at the foot. When the paper is shown to him, he is required to swear or affirm that its contents are true, and that the name and handwriting are his. Affidavits in all the English courts must be taken and expressed in the first person of the deponent. The *jurat*, with which the A. closes, specifies the officer before whom, the place where, and the time when it was sworn, and this is signed by the officer or magistrate. When an A. is sworn in open court, that circumstance is mentioned, and no officer is named. In Scotland voluntary affidavits are not generally received as evidence, because they are *ex parte* statements, no opportunity being afforded for cross-examination. To this rule, however, there are exceptions. Claimants are required by the bankrupt statute to lodge their claims with A. or oaths of verity; and there are other similar statutory provisions. An A. is sometimes required also at common law, as in applications for warrants *in meditatione fuga*. By 5 and 6 Will. IV. c. 62, various unnecessary oaths and affirmations were abolished, and declarations substituted in lieu thereof, and voluntary and extra-judicial oaths and affidavits were suppressed. The oath of allegiance, and all oaths in courts of justice, were expressly exempted from the operation of the statute; and by 6 and 7 Vict. c. 43, this exemption was extended to ratifications by married women. The lord chancellor of England is empowered by 6 and 7 Vict. c. 82, to grant commissions for taking affidavits, affirmations and declarations in Scotland.

**AFFIDAVIT** (*ante*). In the U. S., judges, justices, notaries, commissioners, and some special officers, have authority of law to take affidavits. All the states appoint commissioners in other states (residents of such other) to exercise the power. By N. Y. law, affidavits may be taken anywhere for use in N. Y., if the person taking is authorized at the time and place to do so. Generally the authority of foreign officials to take A. must be certified or verified in court. When a judge takes an A. in court his signature must be authenticated. Our ministers and consuls abroad have power to take A., and so have British consuls and nearly all similar officers. No particular form of A. is prescribed. An A. of merit is one made by a defendant, which sets forth that he has stated his case to counsel and is by him advised that he has a good defense to the pending action on its merits. This is required to protect plaintiffs from delay by frivolous shows of defense, but does not always effect the purpose.

**AFFINITY** (Lat. *affinitas*), the relationship created by marriage between the husband and the blood-relations of the wife, and between the wife and the blood-relations of the husband. The relations of the wife stand to the husband in the same degree of A. in which they stand to the wife by blood or consanguinity, and *vice versa*. But between the relations of the two parties by A. there is no A. Thus, there is no A. between the husband's brother and the wife's sister; and by our law, there is no impediment to their marriage. The question as to whether those who are related by A. stand in all respects in the same position as regards marriage with those connected by blood, is one on which much difference of opinion at present prevails. Marriage between a man and the sister of his deceased wife is at present forbidden by statute (5 and 6 Will. IV. c. 64); but an attempt is annually made in parliament to obtain its repeal. (See MARRIAGE.)

**AFFINITY**. Chemical A., or chemical attraction, is the force which produces all chemical phenomena. It differs from the attraction of gravitation in acting, not between masses, but between atoms, and only when the atoms are at insensible distances. It differs also from cohesion, which unites the particles of the same substance, while A. unites atoms of different substances. The compounds thus formed are new bodies, often bearing no resemblance in appearance or other properties to the elements which combine to produce them. Thus, water results from the combination of two gases.

The strength of chemical A. is different between different substances. Sulphuric acid combines with lime, and forms gypsum; but if potash is added, the sulphuric acid leaves the lime, and combines with the potash. As a sort of choice is here manifested, it is called a case of *elective* A. These elective affinities, however, are often altered by a change of temperature, or other accompanying circumstance.

**AFFIRMATION**, a solemn declaration, which, in the case of members of certain religious persuasions, is admitted in lieu of an oath. By 3 and 4 Will. IV. c. 49, 3 and 4 Will. IV. c. 82, and 1 and 2 Vict. c. 77, it is provided that Quakers, Moravians and Separatists (q. v.) who, from conscientious scruples, refuse to take an oath in courts of

justice, may, both in civil and criminal cases, make a solemn A., according to a prescribed formula. For Quakers and Moravians the formula is: "I do solemnly, sincerely and truly declare and affirm." In the case of Separatists this A. further bears to be emitted "in the presence of Almighty God." The penalties of perjury are imposed on those who shall be proved to have affirmed falsely. A later statute (18 Vict. c. 25) has extended the privilege of substituting an A. for an oath to all persons who refuse to be sworn from conscientious motives—the judge being satisfied that the motives are conscientious. (See OATH.)

**AFFIRMATION** (*ante*), a substitute for swearing, or taking an oath. In most of the U. S. a witness may, at his own option, either swear or affirm, and with the same legal effect. In the act of affirming the right hand is raised while the formula is spoken.

**AFFO, IRENEO**, 1741–1800; an Italian writer who left numerous works on history and antiquities; also literary and political works. He was eminent as a philologist.

**AFRAGO'LA**, a t. in Italy, 5 m. n.e. of Naples, noted for manufactures of straw goods. Pop. '61, 16,129.

**AFRA'NIUS, LUCIUS**, a Roman poet and orator who lived about 100 B.C., praised by Cicero and Quintilian for the excellence of his plays.

**AFFRE, DENIS AUGUSTUS**, archbishop of Paris, who fell in the insurrection of June, 1848; b. 1793. At the time of the restoration he was professor of theology at the seminary of St. Sulpice; and on account of his prudent and temperate character, was made archbishop of Paris by the government of Louis Philippe in 1840. Though not yielding a blind submission to all the measures of the government, he abstained from all offensive opposition. When Louis Philippe became an exile, and a republic was proclaimed, the archbishop kept aloof from political strife, but displayed earnest care for the public welfare. During the insurrection at Paris, 1848, he climbed upon a barricade in the Place de Bastille, carrying a green bough in his hand, as a messenger of peace, and wished to persuade the insurgents to lay down their arms. He had scarcely uttered a few words, when the insurgents and the troops commenced firing again, and he fell, mortally wounded by a musket-ball, coming apparently from a window above. He was carried by the insurgents into the house of a priest, and the next day was removed to his palace, where he died, June 27, 1848. He was the author of several theological writings, and of a work on Egyptian hieroglyphics.

**AFFRIQUE, SAINT**, a town of the dep. of Aveyron, France, on the Sorgue, a tributary of the Tarn, 31 m. s.s.e. from Rhodéz. It is situated in a beautiful valley, between two mountains, and is surrounded by meadows, orchards and vineyards. The streets are broad, but the houses are mostly old and mean. It has woolen and cotton manufactories and tanneries. There is a considerable trade in wool, and a principal article of trade is the celebrated *Roquefort cheese*, made from ewe-milk, chiefly in the mountain pastures around the neighboring village of Roquefort. About 10,000 cheeses are made annually. They are kept in cellars by the cheesemongers to ripen. This kind of cheese was sent to ancient Rome, and is highly praised by Pliny. Pop. '76, 5572.

**AFGHANISTAN**, the land of the Afghans, formerly known by the names of Drangiana and Ariana, lies between lat. 29° and 38° n., and in long. from 62° to 73° e. Afghan is a Persian name; the inhabitants style themselves *Pushtaneh* (plural of *Pushtu*). Their country is bounded on the n. by Turkestan; on the e. by Peshawur and Sinde; on the s. by Beloochistan; and on the w. by the Persian highlands of Khorassan. The pop. is variously estimated at from four to nine millions. In the n.e., the alpine region of the Hindu Kush, a wild mountain isthmus cleft by numerous ravines, and towering up into the clime of perpetual ice, unites the high masses of land in eastern with those in western Asia, and presents formidable obstructions to communication between the territory of the Oxus and that of the Indus. In the e., the Soliman mountains abruptly divide the country from the flat regions of the Punjab and the plains of the lower Indus. There are only two passes leading through the highlands of A. to the Indus: that in the n., formed by the deep valley of the Cabul river, has strong positions of defense at Jelalabad and Peshawur, not far from the Khyber pass; while that in the s., the Bolan pass, forms a way of communication with Sinde. The Hindu Kush and Ghor mountains, which continue the range westward, forming the Paropamisus of the Greeks, have been little explored. The elevated terraces of Cabul and Ghiznee slope gently down towards the s.w. Though the climate has generally a continental character, yet the differences of elevation and unequal distribution of water render it various. The date-palm ornaments the oases in the sandy desert to the s.w., and in the deep sheltered valleys of the e. the cultivation of cotton and sugar succeeds; but the high terraces of Cabul and Ghiznee (8000 to 9000 ft. above the level of the sea) are exposed to a severe winter, with heavy falls of snow. The vine flourishes here in company with apricots, apples, pears, plums, cherries, and fields of European corn. Tulips, aromatic herbs, rhubarb, tobacco and asafœtida are extensively grown; and in the well-watered valleys, pomegranates and oranges, with a profusion of roses, display the luxury and splendor of an Indian clime. A. is rich in minerals; iron and copper especially are abundant.

The Afghans are generally powerfully made; and though the features of the men may be styled harsh, the cheek-bones being high, and the nose very large, they are often

expressive of candor, earnestness and deliberation. The position of the Afghan language among those of the Indo-germanic branch has been much discussed. A recent writer on the subject, Dr. E. Trump, says it is Indian rather than Iranian. The only authors in the Pushtu language are lyrists and ballad-writers, but the Persian is employed in prose composition, and the Persian authors are familiar to the educated Afghans. In religion they are Mohammedans according to the version of the Sunnites, and are strongly opposed to the Persians and the Sikhs, who belong to other sects.

The Afghans have been identified with the inhabitants of a hilly country on the western slope of the Soliman mountains, mentioned by Herodotus. In the 11th c. they are referred to as a small clan in the same district, who, since that period, seem to have assimilated and absorbed populations surrounding them. They first appeared as an independent power during the internal discords of Persia after the death of Nadir Shah. Ahmed Khan, of the race of Abdalli (1747-73), took advantage of these feuds, and liberated A. from Persian rule. His success founded the Douranee dynasty. When his son Timur died, in 1793, a contest for the throne took place between the brothers Zemaun, Mahmud, and Shah Sujah, which ended in the success of Mahmud, who, however, was compelled to abdicate the throne in 1823, and died in 1829. The empire now fell into the hands of three brothers, of whom the oldest, Dost Mohammed, ruled at Cabul, the most important of the three divisions of the country, where he had a revenue of 1,400,000 dollars, and an army of 18,000 men. Still, the country was in an unsettled state; for Dost Mohammed was at war with Lahore in the e., and in the w. the Persians had invaded Herat. On the 1st of Oct., 1838, the governor-general of India (lord Auckland) declared war against A., on the grounds that Dost Mohammed had unlawfully attacked the British ally, Runjeet Singh; that the military operations of the Afghans had betrayed a hostile purpose towards India; and that Shah Sujah, as the rightful heir to the Afghan throne, had placed himself under British protection. The British forces advanced through the Bolan pass to Candahar, where Shah Sujah formally claimed possession of the country. On the 21st of July, the army encamped before Ghiznee, and after some hard fighting that fortress was taken. On the 7th of Aug., Shah Sujah, with the British forces, entered Cabul, and the conquest was regarded as complete. It was a gross mistake of the nature of the country and the character of the people. The land had been invaded, but was by no means conquered. Dost Mohammed had surrendered to the English; but his son, Akbar Khan, was actively engaged in a conspiracy, of which Sir Alexander Burnes and the envoy Macnaghten were not aware until it was too late. At the beginning of winter, when help from India was impossible, the outbreak took place at Cabul, when Burnes, Macnaghten and several British officers were slain. It was then agreed that the invaders should leave the country; while, on the other hand, Akbar Khan and his confederates stipulated to provide an escort, and make other necessary arrangements for the retreat. Depending on these promises, the British army left Cabul on the 6th of Jan., 1842, in order to return by the Khyber pass into India; but neither escort nor provisions were supplied by the Afghan leaders, and the severity of the season increased the misery of the retreat. The fanatical tribes of the districts harassed the flanks and rear of the army, and slew women and children as well as men. Out of a host of 16,000—or, if we include women and children, about 26,000—only one man (Dr. Brydon) escaped to carry the dismal tidings to gen. Sale, who still held his position at Jelalabad. Almost against his own will, the new governor-general, lord Ellenborough, sent other forces into A. Gen. Nott marched from Candahar to Ghiznee, which was again taken after a slight resistance, and then proceeded to meet the army which, under gen. Pollock, had marched through the Khyber pass to Cabul. Here the force of Akbar Khan was defeated and routed, and the place was as far as possible desolated. The English officers and their ladies who had surrendered themselves as prisoners to Akbar Khan were restored to liberty, and soon afterwards the troops marched back to India. It was believed now that the Afghans were deprived of all power to confederate against the government of India; but this conclusion was too hasty, for in 1846 they formed an alliance with the Sikhs against the British; and the disturbances in the Punjab were not quelled without several sanguinary engagements. After the decisive battle of Gujerat (Feb. 21, 1849), the Sikhs were forsaken by the Afghans, and Dost Mohammed, with about 16,000 men, fled over the Indus. After this period, Dost Mohammed devoted his attention almost exclusively to the consolidation of his dominions. He died in 1863, appointing Shere Ali, one of his younger sons, as his heir. At first, the choice was acquiesced in by the sixteen sons of Dost Mohammed, a large number of whom were governors of provinces; but disputes followed, which for many years kept A. in a state of anarchy. See CABUL. The British government of India had recognized Shere Ali at his accession, and when in 1868, after his long struggle with his brothers, he obtained possession of Cabul, and became *de facto* ruler of the greater part of A., direct assistance was given him to secure the position for which he had fought so hard. Sir John Lawrence, then Indian viceroy, sent him first two and afterwards four lakhs of rupees with 3500 stand of arms. The next viceroy of India, lord Mayo, met the Ameer in state at Umballa, in March, 1869. It was then explained to him that her majesty's government had no desire to interfere with the affairs of A., except to check civil war, and, by so doing, to secure the peace and prosperity of the country. This intimation was accompanied by another large present. In the same year, the Ameer conceived the

idea of invading Bokhara (q. v.) and attacking the Russians, but was restrained by English advice. After 1869, Shere Ali endeavored to secure tranquillity in A. He was alive to the strife that had been occasioned by intrusting power to relatives, and he endeavored to replace the members of his family as much as possible by strangers. He also indicated very distinctly that he did not intend to select as his heir his son Yakooob—who, at an early age, had shown great ability as governor of Herat, and had, on many occasions, given his father most valuable assistance—but a younger son, Abdullah. The claims of Yakooob to share in the government of A. were ignored, and the result was that, in 1870, he headed a rebellion against his father; but in the following year a reconciliation was effected through the intervention of England. In 1869, it was settled between England and Russia that all the provinces between the Oxus and the Hindu Kush should be treated as part of A. In 1878, in consequence of new Russian diplomatic relations to A., Shere Ali was invited to receive a British mission. The refusal of the Afghans to admit the mission, which had advanced to the mouth of the Khyber pass, led, after some fruitless negotiations, to war. Hostilities began by the forcing of the entrance to the Khyber towards the end of November. There was some severe fighting in the passes, but the invaders were everywhere successful. Before the end of Dec., Jelalabad was occupied without resistance, and Candahar a little later. Shere Ali, who had fled, died early in 1879; and Yakooob Khan, proclaimed Ameer, made peace in May. It was provided that there should be a British resident at Cabul, and that Britain should defend A. against foreign aggression, the Ameer receiving a subsidy. The Kuram, Pishin and Sibi valleys became British territory, and the Khyber and Michni passes came under British control. But in Sept. of the same year the revolted troops of the Ameer surrounded and attacked the British residency. The resident, Sir Louis Cavagnari, and his staff, with almost the whole of their Indian guard, were slain after a desperate but bootless struggle. Measures were immediately adopted by the Indian government for punishing the outrage. The Ameer put himself under British protection, and abdicated his sovereignty; and, after some fighting, Cabul was reoccupied in the beginning of October.

**AFIUM-KARA-HISSAR** (*Opium Black Castle*), a city of Asia Minor, in the pashalic of Anatolia, 170 m. e. by n. from Smyrna. It stands near the Akar, partly on level ground, and partly on a rising ground among rocks. Above the city towers an isolated rock of 300 to 400 ft. in height, almost precipitous on most sides, and very steep on that by which alone it is accessible. The summit has in former times been fortified. The streets of the city are very narrow. Most of the houses are of stone, and well built. A great trade is carried on, the city being an entrepot between Smyrna and Europe on the one hand, and Armenia, the countries on the Euphrates, and Persia on the other. The products both of Europe and the east are to be found in its markets. A principal article of trade is opium, produced in the neighborhood, and from it the city derives its name. There are here and in the neighborhood manufactures of felts, carpets, arms and saddlery. The saddlery of A. was formerly in request throughout the whole Turkish empire, but the demand for it has greatly fallen off. The pop. is supposed to be about 60,000.

**AFRICA**, the second in point of size of the great divisions of the globe, has long been truly the "dark continent," the land of mystery; but of late much has been done to open it to us by the enterprise of explorers, the zeal of missionaries, the perseverance of commercial speculation, and the military aggressions of Europeans. The extreme n. and n.e. borders, in ancient times the seats of civilization, had fallen back into a state of barbarism, but are now partially restored to importance. Great progress has also been made from the s. in exploring the elevated land of the interior, and introducing commerce among the natives. The efforts of England to suppress the slave-trade, and to open new channels for manufacturing industry, also seem likely, in the course of time, to make great alterations in the condition of the peoples on the western coast. The chief hindrances are found in the few accessible points on the coast, the pestilential climate of the marshy lowland bordering on the sea, the barrenness of vast tracts like the desert of Sahara, over which one must travel rapidly, and only by certain routes; and lastly, the barbarism and sanguinary character of the natives. On the other hand, the position of A. is favorable to its exploration by Europeans. Its most remote harbors are almost as near as N. America—nearer than Brazil, and much nearer than British India.

The valley of the Nile was known in the earliest period of history as the nursery of commerce, arts and sciences; but while Egypt was flourishing, the rest of A. was almost totally unknown, and was vaguely spoken of as Libya. The Greeks and the Romans penetrated into A., probably as far as the Niger; but they had scarcely any definite knowledge of the countries lying beyond Numidia, while South A. was entirely unknown. The tradition that Jewish and Tyrian merchants, on their voyages to Ophir, explored the e. coast of A., is dubious; but another account, that, in the time of Pharaoh-Necho, the Phœnicians circumnavigated A., seems to be well authenticated; and it is probable that the Carthaginians had a better knowledge of parts of the interior than we have in the present day. For a history of the older discoveries in A., we may refer to Murray's *Historical Account of Discoveries and Travels in Africa* (2 vols., Edin. 1817), and to Leyden's *Sketch of the Discoveries in Northern and Western Africa* (Edin. 1799).

The 15th c. was marked by an extension of geographical knowledge in A. as elsewhere. Henry the navigator sailed round the formidable cape Nun (*non plus ultra*); Diaz

and Vasco de Gama discovered the cape of Good Hope; and both the western and the eastern coasts were partly explored by several European voyagers. The older travels and discoveries may be arranged in the following order: In the 14th c., the travels of the Arabian Ebn Batuta in the n. of A. In the 15th c., the Portuguese discoveries of Madeira, cape Blanco, Senegal, Guinea, Benin, the cape of Good Hope, etc., and the navigation of the e. coast by the Portuguese Covillham, who first traveled in Abyssinia. In the 16th c., the travels of Leo Africanus through Barbary and Sahara to Abyssinia, the travels of the German Ranwolf in North A., and Windham's voyage to Guinea, which was followed by several other expeditions in 1554 and 1562. In 1570 and 1600 the Portuguese visited Monomotapa, then a powerful state near the Mozambique coast. In the 17th c., the Englishmen Jobson and Thomson, in their journey to Timbuctoo, opened British commerce with A., and the slave-trade immediately followed. In 1662, we find a French colony on the Senegal, and many exploring journeys to the interior were made by Renouard and others. In 1624, the Jesuit Lobo endeavored to find a way from the equator through the interior as far as Abyssinia. Thevenot's journey to Egypt in 1652, the English occupation of Cape Coast in 1664, Bruce's voyage to Senegambia, and several other visits to the western coast, mark the progress made in the latter half of the 17th c.

In the course of the 18th c., various additions were made to our store of information on A. In the year 1788, the African society was founded in London, and, under its direction, Ledyard and Lucas were sent to explore the Niger, and were followed by major Houghton. The English colony of Sierra Leone was founded in 1790. The French expedition to Egypt, towards the close of this c., gave a new impulse to researches in A.

In the 19th c., the most various motives have co-operated in favor of an extended knowledge of this vast continent. The captains of English cruisers, employed to suppress the slave-trade, have supplied some valuable information; the governors of the colonies and private merchants have contributed their share; and enterprising travelers from all sides of the coast have endeavored to strike out paths to the interior. The works published on A. since the year 1800 are consequently very numerous. A few of the more important may be mentioned. In 1803 to 1805, Lichtenstein traveled in the district n. of the cape of Good Hope, and first furnished information regarding the Bechuana tribe. The travels of Mungo Park from Timbuctoo to Bussa are familiar to every one. In 1809, Burckhardt was sent out by the African society, and his explorations, rich in manifold results, occupied the years 1812-1816. To the French we are indebted for much valuable information concerning Morocco, Algeria, and the neighboring parts of Sahara. The labors of Oudney, Clapperton, Denham and Lander in the Sahara and Sudan are memorable by the discovery of lake Tchad and the course of the Niger. Since about 1840, our knowledge of South A. has received many important additions from the missionaries stationed there, especially Moffat; while David Livingstone, who, from 1843 to 1873, was engaged in trying to open the countries n. of the cape of Good Hope, penetrated in 1849 as far as lake N'gami, in 20° s. lat.; and in 1853, ascending the Leeambye (Zambesi) northward for several hundred miles, succeeded in crossing the continent to Loondo on the w. coast. Having retraced his steps to the point of the Zambesi from which he had started, the adventurous traveler next followed that stream till he reached the e. coast, at Quilimane, in 1856. From 1859 to 1863 was spent in various explorations of lake Nyassa and the neighboring regions. Again setting out in 1866, he found, in the region s. of lake Tanganyika, the river Chambezi. This river, which is specially known by this name ere it falls into lake Bemba or Bangweolo, is known between that lake and lake Moero as the Luapula, and further on in its course as the Lualaba; and was by Livingstone traced through these lakes and as far as 4° s. lat. Livingstone's belief was that this basin, now known to be the upper Congo, contained the head-waters of the Nile. In 1871, along with Stanley, he found the river Rusizi flowing into the n. of lake Tanganyika. His last enterprise consisted in further exploration of these regions, and new efforts to find the Nile sources. He died at Ilala, beyond lake Bemba, in May, 1873. Burton and Speke, crossing the Border mountains from Zanzibar, in 1857, discovered lake Tanganyika; and the former, then journeying to the n.e., discovered the southern part of the great Victoria Nyanza, which he supposed to be the head reservoir of the Nile. A second expedition, undertaken by Speke and Grant in the end of 1860, penetrated as far n. as Gondokoro on the White Nile, and added vastly to our knowledge of the eastern equatorial regions of Africa. At Gondokoro, Speke and Grant were met by Mr. (now Sir Samuel) Baker. Baker, accompanied by his heroic wife, pushed on to the s., and discovered in 1864, w. of the Victoria, another great lake, which he called the Albert Nyanza. He returned in Sept., 1873, from a second expedition—of a military character—undertaken in 1869, at the expense of the pasha of Egypt, to suppress slavery in the upper regions of the Nile. The geography, language and manners of the inhabitants of Abyssinia, Sennaar and Kordofan have also during late years been greatly illustrated by the efforts of various European travelers. The researches of Dr. Barth and his companions (1850-1855)—investigating the same central division of the continent as Clapperton and Denham—and Dr. Schweinfurth's travels (1868-1871) in unexplored regions, have enriched our store of knowledge regarding this land of mystery. In 1874-5, lieut. Cameron surveyed the lower half of lake Tanganyika, and walked across tropical Africa from e. to w., all but determining the source of the Congo. Finally, Mr. Stanley, who

had started from Zanzibar in 1874, explored the Victoria Nyanza and its affluent the Shire in 1875-6. Then striking the Lualaba at Nyangwe in the end of 1876, he forced his way down the entire course of the stream; and arriving at the mouth of the Congo in autumn 1877, demonstrated that the Lualaba and the Congo are identical. (See NILE, NYANZA, NYASSA, TANGANYIKA, ZAMBESI; and ALBERT NYANZA and SPEKE.)

A. is situated in the eastern hemisphere, to the s. of Europe, and the s.w. of Asia, and lies between lat.  $37^{\circ} 20'$  n. and  $34^{\circ} 50'$  s., and long.  $17^{\circ} 30'$  w. and  $51^{\circ} 20'$  e. It is of an irregular triangular form, with the vertex towards the s., having the Mediterranean on the n., the isthmus of Suez, Red sea, and Indian ocean on the e., and the Atlantic on the w. The formation of the Suez canal has nominally converted A. into an island. The coast-line is marked by few indentations or projections; the most important gulf being that of Guinea, on the w.; and capes Bon, Verd, Good Hope and Guardafui the extreme points respectively on the n., w., s. and e. The greatest length of the continent, taken from n. to s., is about 4935 m.; its greatest breadth, from e. to w., 4615; and its area, including the adjacent islands, not less than 11,854,000 sq.m.

What is known of the physical features of A. may be shortly sketched under the following heads: 1. The triangular region s. of cape Guardafui and the gulf of Guinea is mostly a high table-land, having fringes of mountains crowning its edges. Between the coast and the beginning of the elevation runs a belt of lowlands, varying from 50 to 300 m. in breadth. The Lupata range, seen running parallel with the coast, forms the eastern crest of the table-land. Between  $3^{\circ}$  and  $4^{\circ}$  s. lat., it reaches, in the snow-clad Kilimandjaro and Kenia, the height of 20,000 ft. The mountainous country of Abyssinia is the eastern prolongation of the plateau and its elevated crest; in the summit of Abba Yared, at the northern extremity, it rises to 15,000 ft. At the s., the hills of Cape Colony rise in stages from Table mount to the summits of the Nieuwveld and Sneeuwberg, in the n. of the colony, which are estimated at 7000 to 10,000 ft.; the spaces between the ranges being shrubby *kloofs* or valleys, and broad elevated terraces or *karroos*. From the elevated crest that runs parallel to the w. coast from Cape Colony to Valfish bay, Mr. Galton describes the country as sloping slightly inwards, thus giving a cup or basin shaped appearance to the interior of the continent. Towards the n.w. the border of the table-land rises in the Cameroons to the height of 13,000 ft. Its northern boundary is not determined: but it is likely that the valley of the western branch of the Nile penetrates into it, dividing it into two portions, an eastern and a western. A mountain seen lying s. from lake Tchad is supposed to be one of its northern outposts.

2. North and n.w. of the great triangular table-land lies Sudan or central Nigritia, under which name may be comprehended the countries watered by the Senegal, Gambria and Niger, along with the coast of lower Guinea, and the basin of lake Tchad. In the w. of this section is a mountainous table-land of no great elevation, in which the rivers above named take their rise; the Kong mountains, which run parallel to the Guinea coast, are a branch of this elevation. Eastward of the Niger the country is hilly, alternating with rich, often swampy plains. In the basin of lake Tchad is a vast alluvial plain, one of the largest on the globe, and of great fertility.

3. Between Sudan and the cultivated tract which borders the Mediterranean, stretches the Sahara or great desert. It extends s. nearly to the Senegal, the northern bend of the Niger, and lake Tchad, northward to the Atlas range in Morocco and Algeria, and towards Egypt it reaches to the Mediterranean. Its average breadth from n. to s. is about 1000 m. Its length from the Atlantic to the western edge of the valley of the Nile is 2000. Over a great part of this region rain never falls, and everywhere it is rare; it is thus condemned to sterility. It consists partly of tracts of fine shifting sand, which frequent storms of wind raise into the air, so as often to overwhelm travelers. But the greater part of the surface consists of naked but firm soil, composed of indurated sand, sandstone, granite and quartz-rocks, often rising into ridges or hills. The desolation is interrupted at intervals by patches, sometimes of considerable extent, covered with bushes and coarse grass, and often of great beauty and fertility. These *oases* or *wadies*, as they are called, which are occasioned by subterranean springs, are most numerous and fertile in the eastern portion of the desert. The easiest route across the desert to Sudan runs from Tripoli through the kingdom of Fezzan to lake Tchad. Fezzan enjoys periodic rain from the moist winds of the Mediterranean, which extends further into the continent here than elsewhere. The portion of the desert lying e. of the route above described is called the Libyan desert. It is chiefly in this region that the oases are susceptible of cultivation; the tracts of vegetation in the western portion are fit for little else than pasture, mainly for goats and sheep. The principal production of the more fertile oases is dates; but other fruits and grain are also cultivated. Gum-arabic is another production. Some of the larger oases support thousands of inhabitants living in villages. Commerce is carried on across the desert by various routes by means of caravans, consisting of from 500 to 2000 camels, with their attendants. The distance between the wells sometimes exceeds 10 days' journey; and when a well is found dry men and animals are in danger of perishing. The inhabitants consist of independent tribes of Moors, Berbers and Arabs.

4. The Atlas region, comprehending the mountainous countries of Morocco, Algeria and Tunis. The northern slope towards the Mediterranean, called the Tell, is, in aspect, climate and productions, similar to the opposite coast of Europe; the southern side merges

gradually into the Sabara. Some parts of the chain are considerably above the snow-line, and the highest summits may reach 13,000 ft.

5. The region bordering on the Red sea, consisting of Abyssinia, Nubia and Egypt. Abyssinia, we have seen, is the mountainous termination of the great southern plateau. Between this and the Mediterranean extends the low valley of the Nile, separated from the Red sea on the e. by a rugged mountainous region, and from the Libyan desert on the w. by a low ridge of limestone and sandstone.

Regarding the hydrography of A., much is still to be ascertained. Livingstone's discoveries have shown that the portion which, until recently, was termed the "unexplored territory," is anything but the barren and riverless desert that we imagined. But as hardly one of its streams has been traced throughout its entire course, while nearly the entire tributaries of these are very imperfectly known, we must wait for the result of further explorations, before positive statements can safely be made. Those of the s., which mostly rise in the neighboring highlands, are, in many instances, little better than mountain-torrents, having short and rapid courses; and the embouchure, generally in the delta form, is commonly obstructed by a bar of sand. The Orange river, for instance, is filled with sand at its mouth.

*Rivers.*—The great rivers of A. are the Nile, the Niger, the Zambesi, the Orange, the Congo, the Senegal and the Gambia. See articles NILE, NIGER, etc. The first of these is formed by the junction of two rivers—the White Nile (Bahr-el-Abiad) and the Blue Nile (Bahr-el-Asrak). The former has its sources in the great equatorial lakes, including those called the Victoria Nyanza and the Albert Nyanza, skirts the eastern edge of Kordofan, and passes into Nubia, where it is joined by the Blue Nile at Khartum, after the latter has broken through the highlands of Abyssinia. The single stream then sweeps circuitously through Nubia in a succession of cataracts, and descending into Egypt reaches the Mediterranean through the far-famed delta. The second of the great rivers, the Niger, Joliba or Quorra—for it goes by these and other names in different parts of its course—rises in the Kong mountains of Guinea, about  $9^{\circ} 25' \text{ n. lat.}, 9^{\circ} 45' \text{ w. long.}$ , and flows first n.e. till it reaches Timbuctoo, where it bends e. for a short distance, and then descends in a s.e. direction into the gulf of Guinea. Its length is estimated at 2500 m., and its navigability has been ascertained for a distance of upwards of 400 m.; but its banks are very pestilential. Its principal tributary is the Tchadda or Beaué. At the extreme w. of the mountains of Kong, and not far from the source of the Niger, rises the Senegal, which flows with a crescent sweep to the n.w. through Senegambia, and enters the Atlantic n. of Cape Verd. The Gambia, a smaller river, runs in a similar direction, and falls into the sea s. of Cape Verd. The Congo, proved by Stanley to be identical with the river called at various parts of its course the Chambezi, Luapula, Lualaba, etc., runs northwards to a point about  $2^{\circ} \text{ n. of the equator}$ , and thence s.w. towards its embouchure in the Atlantic at Cape Padrone. Its whole course is about 2900 m. The Orange river flows w. with many windings through what is popularly termed "the country of the Hottentots;" while the Zambesi, explored almost throughout its entire course by Livingstone, is rich in affluents, and runs in an easterly direction, entering the channel of Mozambique about  $18^{\circ} \text{ s. lat.}$

*Lakes.*—The lakes of A. are, as yet, no better known to us than its rivers. *Tchad, Chad*, or more correctly, according to Dr. Barth, *Tsad*, the chief lake of Sudan or central A., has a circumference of about 200 m., with a depth varying from 8 to 15 ft., and an elevation of 850 ft. above the sea-level. Though it has no outlet, its waters are cool and clear, and abound with fish. Besides a multitude of temporary streams, it is the recipient of several large rivers. The chief is the Shary or Asu, from the s.e. *Dembeu*, or Tzana, in Abyssinia, through which the Blue Nile flows, is about 65 m. long and 30 broad, and lies 6000 feet above the sea-level. Lake N'gami, in southern A., the center of the internal drainage of the country between the Orange and the Zambesi, is about 2500 ft. above the sea-level, 70 m. long and 20 broad. N. of the Zambesi, between the parallels of  $10^{\circ}$  and  $14^{\circ} \text{ s.}$ , and about 350 m. inland from the coast of Mozambique, lies lake Nyassa, at an elevation of 1200 ft. above the sea-level. The discoveries of Tanganyika and the Victoria Nyanza by Speke, and of the Albert Nyanza by Baker, have been already noticed, and will be found fully described in their proper place. It is now satisfactorily ascertained that the source of the Nile lies in the basin of these lakes; but Livingstone was of a different opinion, and at his death was employed in exploring another basin some degrees westward of Tanganyika, the lakes in which (Bemba or Bangweolo, Moero, and many smaller lakes) are now known to drain into the river Lualaba or Congo. In time of flood, Tanganyika also discharges into the Lualaba.

*Geology.*—The geology of A. is known as yet only from cursory observations made at isolated points. The character of the Sahara has been already indicated. The section traversed by Dr. Livingstone presents a variety of schists, shales, sandstones, and tufa, through which protrude granite and trap-rocks. In one place towards the e. side of the continent, the sandstone is found overlying coal. Between Tripoli and Murzuk there is a plateau, the dark sandstone of which, disintegrated, fills up the inequalities of the surface, from which the black rock stands out in fantastic cones. The lofty barrier of limestone which forms the western boundary of Egypt, reappears in the rugged ranges of hills which break the monotonous waste of Sahara; they sometimes contain marine shells. Secondary limestone also constitutes the lower skirts of the Atlas mountains, but what constitutes their basis has not yet been discovered.

*Climate.*—There are three great varieties of climate, corresponding to the physical structure of the continent: 1st, that of the plateaus; 2nd, that of the terraces which lead to them; and 3d, that of the coasts. In the vast desert of Sahara, extending over an area equal to that of the Mediterranean sea, almost destitute of water and vegetation, and partly covered with tracts of sand and bare low rocks, the heat of the day is uniformly contrasted with the coldness of the night; while on the terrace-land of Limbu, for instance, situated behind the Sierra Leone region, we find a temperate and wholesome climate; and in that rising behind the slave coast we have beautiful landscapes, abundant springs, new forms of vegetation, and a mild Italian air. The natives of Congo call their terrace-lands, which are well cultivated and thickly peopled, "the paradise of the world." But the flat coasts, which are often overflowed in the rainy season, have a very oppressive atmosphere, and from the morasses at the mouth of the rivers a malaria arises which is pestilential to Europeans. This malaria has been supposed to arise from the decay of the vegetable matter brought down by the rivers from the dense mangrove woods, which, mixing with the salt water on the coast, produces sulphureted hydrogen gas. The region of pestilential air has been calculated to extend about 100 m. inland, but only 40 m. out at sea, and to rise to a height of 400 ft. above the sea-level.

*Productions.*—The *vegetation* of A. is decidedly less varied than that of Europe or Asia. Along the Mediterranean sea-board it greatly resembles that of southern Europe. The tropical regions are not so rich in species of plants as those of S. America, but still they exhibit many peculiar genera. As we leave the sultry coasts and ascend the terraces towards the interior, we pass gradually from tropical productions to those of the temperate zones, which all flourish well in several parts of A. Though the forests cannot rival those of Brazil, they are rich in valuable woods, especially the harder kinds; some of them excellent for ship-building. Here we find the gigantic *adansonia* (q. v.), *digitata* or baobab. Ebony, certain kinds of rosewood, and the timber called African teak, are among the productions of the tropical forests. The butter-tree (*bassia*, q. v.) is one of the most remarkable productions of the central regions. Extensive level tracts are covered with acacias. Certain palms are very characteristic of different parts of A., and are of the greatest importance to the inhabitants, particularly the date-palm (q. v.) in the n., and in an inferior degree the doom-palm (q. v.), both of them growing in regions comparatively arid, and often surrounded by the very sands of the desert; whilst the oil-palm (q. v.) flourishes amidst the tropical luxuriance of the w. and supplies an article of commerce which now attracts the ships of Europe, in constantly increasing numbers, to shores once frequented only for the prosecution of the slave-trade. The cocoa-nut palm (q. v.) flourishes on many parts of the tropical coasts. A large quantity of oil is produced also by a plant of a very different description, the ground-nut (*arachis*, q. v.), a leguminous herbaceous plant, which has the remarkable peculiarity of thrusting its pods into the ground to ripen there, and which is now so extensively cultivated that nine millions of bushels of ground-nuts are annually exported from the Gambia. The southern extremity of A. is remarkable for the vast number of its species of mesembryanthemums and heaths. Pelargoniums, iridaceæ and proteaceæ are also among the most characteristic features of its vegetation. Euphorbiaceæ abound in most parts of the continent. Many of the productions of other countries have been introduced, both in the tropical and temperate parts of A. Maize is now extensively cultivated, as well as rice, wheat, and millet. A peculiar kind of grain, called fundi, or fundungi (*paspalum exile*), is cultivated in the west, and grains called teff and toccus (*poa Abyssinica* and *Eleusine toccus*) in Abyssinia. Coffee grows luxuriantly and of good quality. Indigo and tobacco are easily cultivated, and cotton has succeeded well where it has been introduced, as in Egypt, where, however, it requires artificial and laborious irrigation; while in the rich and well-watered soil of Sennaar it flourishes even with a most careless style of cultivation, and might, without doubt, be produced in enormous quantity. Other regions, as Natal, seem likely soon to produce it abundantly. The vine is cultivated with success at the cape of Good Hope, and the sugar-cane in different parts of the continent.

In the *animal kingdom* we find the lion, the leopard—often called the tiger, but the tiger is not yet known except as a native of Asia and the Asiatic isles—hyenas, jackals, and others of the canine family, a species of elephant, differing in some particulars from that of Asia, several species of rhinoceros, the hippopotamus, wart-hogs (*phascochaerus*), and many kinds of monkeys, particularly within the tropics. The giraffe, the zebra, and the quagga, are peculiar and characteristic, as are also numerous species of antelope, which occupy, in African zoology, the place of deer in other parts of the world. The gnu is one of the most remarkable of the antelope genus. Some of the smaller species occasionally appear in prodigious numbers, devastating the fields of the colonists. The ostrich is found in almost all parts of A. Parrots, flamingoes, and guinea-fowls may also be mentioned among the birds. Crocodiles are found in the rivers, and many kinds of lizards and serpents occur, not a few of the latter being poisonous. There are also tortoises and turtles of different species. The domestic animals succeed well. Camels are said to have been introduced by the Arabs, and are plentiful in the northern regions.

It would be hazardous to assert that A. is deficient in *mineral wealth*, though, judging from our present imperfect knowledge, it does not seem to be extremely rich. Gold is much more plentiful than silver, being found abundantly in the sands of the great rivers that flow out of the central region, on the coast of Guinea, and also in the s.e. of

A. The Sierra Leone coast has valuable iron ore, which is also found in the upper Senegal, the region of Timbuctoo, the Congo chain of mountains, Egypt, and Darfur. Copper is plentiful at Majomba and in some other places; salt may be obtained from almost every district in A. except Sudan, and sal-ammoniac, saltpeter, sulphur, and emery in various portions of the continent.

*Population.*—The pop. is vaguely estimated at about 190,000,000. The native inhabitants belong to one of the three great divisions of the human family, called, by Dr. Latham, Atlantide, the Ethiopic of other ethnologists. The subdivision into tribes is endless, but they may be all classed in six groups: 1. *The Negro Atlantide.*—These have, in an exaggerated form, the black unctuous skin, woolly hair, projecting jaws, flat nose and thick lips characteristic of the whole variety. But it is important to observe the comparatively narrow area to which the negroes proper are confined. They occupy w. A., from the Senegal to the Gaboon, Sudan in the centre, and the low parts of the upper Nile. The dusky or brown hue is more prevalent through A. as a whole than the jet-black of the negro, which seems nearly coincident with river valleys and deltas lying within the tropics. 2. *Kaffir Atlantide.*—In physical conformation, they are modified negro; the jaws are less projecting; their language has some singular peculiarities. They occupy from n. of the equator to the s. of the Tropic of Capricorn. 3. *Hottentot Atlantide.*—These, according to Dr. Latham, have a better claim to be considered a second species than any other section of mankind. Their color is brown rather than black; the hair grows in tufts. The stature is low, and the bones of the pelvis are peculiar. Their language has a characteristic *click*. They inhabit the s. of the continent, and are divided into Hottentots and Saabs, or Bushmen. 4. *Nilotic Atlantide,* occupying the water-system of the upper and middle Nile. The leading tribes are the Gallas, Agows, Nubians, and Bishari, forming the population of Abyssinia, Adel, and Nubia. It connects by imperceptible gradations the Coptic and Semitic groups with the rest of the African. 5. *Amazigh Atlantide,* usually called Berbers. In conformation, they vary from the negro to the Arab type. The language is *sub-Semitic*. They inhabit the ranges of the Atlas, the Sahara, the Canary isles, and are found as far s. even as the center of Sudan. 6. *Egyptian Atlantide,* or old Egyptians, represented by the modern Copts. Both language and physical conformation connect them, on the one hand, with Berbers and Nubians, on the other hand, with the Assyrians, Jews, etc.

In *religion* the natives are as various as in language; but it may be questioned whether some of the tribes, especially in s. A., can be fairly described as having any religion. In not a few of these, the religious consciousness seems wholly extinguished, and the very terms which express it, to have dropped out of their language. Such, at least, was the result of Moffat's observations, though perhaps the degradation in which he found some tribes plunged was in itself a barrier to a just and adequate communication with them; for the lower that races or individuals sink, the less easy is it to understand them. Throughout the n., and to a considerable extent in the interior, the creed of Mohammed is received, but held very loosely by many. The Mohammedan tribes on the w. coast divide themselves into two classes—the *Marabouts* and the *Sonnachees*; but it is not easy to understand the exact nature of this distinction, beyond the simple fact that the Marabouts profess to adhere rather strictly to the laws of the prophet, while the Sonnachees are more secular, make little profession of sanctity, but eat pork and will drink spirituous liquors. The lowest form of superstition, styled *fetichism*, prevails among the uncultured negro tribes, as well as among the Gallas, a nation widely spread s.e. of Abyssinia; and the practice of offering human sacrifices is found in many tribes. The Abyssinians hold by tradition a crude form of Christianity.

Of the forms of *government* among the several nations and tribes, our knowledge is not sufficiently definite. Though there is despotism, it appears to be limited to some extent by a respect for the "head-men" in every tribe, who form a sort of aristocracy, and whom the king must consult on all important affairs. The liberty of speech employed in a native parliament, or rather "palaver," is often considerable. Though women are generally found in a degraded position, the wives of the king often take a part in council, and exercise their influence in the affairs of state. Civilization, in the proper sense of the term, is only to be met with in the settlements of the Europeans; for the condition of the *Moors*, *Arabs*, and *Egyptians* is scarcely entitled to rank higher than that of semi-civilization.

Of *science, art, and literature* we can say little; for all that had been achieved under the Pharaohs and Ptolemies disappeared with the conquest of the Moslems. A schoolmaster is found in almost every Mohammedan village; but the Koran is the only book studied. Medicine is little understood, though the tribes in the s. and elsewhere have great faith in its powers, and practice it in a very absurd and superstitious style. Among many tribes, the religion might be styled medicine-worship. Inoculation, as a preservative against the small-pox, is common among the Mohammedan tribes. Mechanical skill is generally respected, and the smith or worker in iron is reckoned among the "head-men" in every tribe.

Of the interior *commerce* or barter of the natives among themselves, our knowledge is scanty. Caravans of camels pass over the wide deserts of the n. by such routes as lead them to the greatest number of springs, brooks, and *oases*, or comparatively fertile places. The chieftains in the desert are the principal traders; and one feature in their character,

though carried to a cruel extreme, is certainly favorable to commerce: debtors are treated with great severity. When payments are delayed, not only the debtor himself, but, if he is absent, any member of his family, may be seized as a slave. Timbuctoo, on the s. edge of Sahara, is the chief commercial depot and central station for the caravans which arrive from Tafflet, Tripoli and other places in n. A. From Timbuctoo they proceed on their route along the course of the Niger to Kashna, another station of commercial importance, which is also visited by the caravans from Sudan and Bornu. From Kashna the caravan-route leads to Bornu and lake Tchad; thence to the territories of the Tibbous and the Tawareks, and on to Murzuk in the oasis of Fezzan. Kulfu is another great meeting-place of the caravans coming from Dahomey in the s.w., Borgu in the n.e., and Niffe in the s.e. There seems to be no doubt that these caravans are in communication with others from the e., and thus connect, in a primitive style of commerce, the Indian ocean with the Atlantic and the Mediterranean sea. The principal places of commerce in the e. are Marnegar, Berbera, Ankobar, Gondar, Sennaar, and Kobbé. In Benguela and Angola, negro caravans from the interior arrive at the chief places on the coast, bringing slaves, ivory, and gold-dust, which are bartered for various commodities, and the plateau of the upper Nile is visited by Arab traders from Zanzibar engaged in the same traffic.

Though A. is so rich in natural productions, and capable of maintaining a thriving commerce with other parts of the world, it is still a painful fact that along its coasts, and in the caravan roads of the interior, the principal trade is in slaves. Baker's great expedition up the Nile, and recent enactments in Zanzibar forbidding slavery, will probably do much to diminish or destroy this odious traffic. The African is fit for something better. Many of the tribes are in a condition which cannot be fairly described as savagism. They have fixed dwellings, though these are merely mud-huts, defended by stockades; and are possessed of some laws or customs which are favorable to commerce. Among several tribes the native merchant is highly respected, and his goods are safe even in times of feud or warfare. The land is cultivated; the natives wear dyed cotton dresses, thicker and more durable than those exported from England, and consequently far dearer. Gold and iron are manufactured with ingenuity. The principal tribes on the Gambia, the Fulahs, the Joliffes and the Mandingoes, and the negroes of the sub-equatorial regions in which Livingstone spent the last twenty years of his life, have qualities which forbid us to despair of the progress of A. in culture. All that is wanted is a free commercial intercourse with the civilized world. Commerce must carry into A. the doctrine that it is better to employ men in trade, than to sell them as slaves. Ability to understand such a truth will not be wanting; and when it is known and practiced, the negro will prove that he is human, and will break through all the natural obstacles placed in the way of his development and improvement.

That portion of A. which is known is divided as follows: Native states and regions—Ashanti, Dahomey, Fezzan, Barca, Bornu, Darfur, Kordofan, Dongola, Guinea, Abyssinia, Morocco, Senegambia, Senaar, Sudan with Sahara, Zanzibar, and the countries of the interior, with others on the east coast. British possessions are—Cape Colony and Natal at the s.; the island of Mauritius, St. Helena, Ascension, Sierra Leone, Cape Coast and the Gambia colony. The French have settlements on the Senegal, with the islands of St. Louis and Gorée, the isle de Bourbon, St. Marie, and the great colony of Algeria. Egypt, Nubia, Tunis, and Tripoli belong nominally to Turkey. There are some N. American forts and settlements in Guinea. The Portuguese have the Azores and Cape Verd islands, with Madeira, Porto Santo, St. Thomas, Angola, Benguela, and Mozambique. The Canary islands belong to Spain. The large island of Madagascar and the Comoro group are under native rulers; but in some of these islands on the east coast the French have recently established themselves, as at Mayotta.

AFRICA (*ante*). *Stanley's first expedition.* After a long time had elapsed with no authentic tidings from Dr. Livingstone, who had set out to explore the interior of A. and when serious apprehensions had begun to be entertained concerning his safety, Mr. James Gordon Bennett, jr. of N. Y., at his own expense (1869, Oct. 17), commissioned Henry M. Stanley, a special correspondent of the *N. Y. Herald*, to make a thorough search for the missing traveler. Mr. Stanley, arriving at Zanzibar Jan. 6, 1871, organized a strong and thoroughly equipped expedition. His instructions seem to have converged to a single point, "Find Livingstone." The expedition left Bagomayo, on the eastern coast of A., opposite Zanzibar, Mar. 21, 1871. The route chosen, leading towards the center of the continent by a course somewhat n. of w., had never been traversed by white men. On the 3d of Nov., after 227 days spent on the road, a caravan came in sight from the direction of Ujiji, a village on the eastern shore of lake Tanganyika. To Stanley's eager question, "What news?" the reply was "that a white man had lately arrived at Ujiji; that he was old and sick, and had white hair on his face." The conclusion instantly was, "He must be Livingstone." The leader of the search was in a state of mingled delight and impatience. With promises of extra payment to each man of his native escort, he brought them to an agreement to press rapidly on. Successive chiefs heading large parties of armed men confronted him demanding exorbitant tribute. Having complied with these demands until his resources drew near exhaustion, he escaped from the region under cover of night, and urged his journey through marshes, and among scattered trees, primitive rocks, fields of bowlders, herds of buffaloes, giraffes, and zebras.

On the 236th day of the march, Ujiji was 6 hours distant. The party were all in their gayest attire, and the garments of the leader, which the thickets had torn to tatters, were exchanged for the new suits which had long been kept in reserve for the occasion. They ascended the last hill; lake Tanganyika appeared, at first a silver thread, soon a wide expanse; he crossed the ridge and Ujiji was before him, only 500 yards distant. He thought not then of weary miles, of blistering plains, of scorching suns. Fifty guns were fired; the stars and stripes led the way and the flags of Zanzibar followed after; 300 yards from the village a swift runner met them, saying only, "Good morning, sir." "Who are you?" was the reply. "Dr. Livingstone's servant, sir." "Is he here?" "Yes, sir." "In this village?" "Yes, sir." "Then off and tell him I am coming." With all Stanley's impatient joy, he was compelled to preserve dignity of demeanor before his savage escort. He would have run, but must only walk; meeting Livingstone he would have fallen on the old man's neck and kissed him, but reflected that a Scotchman might not like that; therefore he only lifted his hat and said, "Dr. Livingstone, I presume." "Yes," was the reply, gently spoken and with a smile. Mr. Stanley said, "I thank God I have been permitted to see you." Dr. Livingstone's response was, "I, too, am thankful I am here to welcome you." Then hands were grasped, the *Herald's* mission was explained, the presence of Arabs and Africans was forgotten. The generous supplies, brought from far, were unpacked. The letter bag, sent from Zanzibar a year before, was handed to Dr. Livingstone with its accounts from his home, and the news of the great civilized world—the completion of the Suez canal and of the Pacific railroad, the expulsion of queen Isabella from Spain, the prostration of France in the German war.

Livingstone, reduced to great straits, had been sick, could eat nothing, had refused everything except a cup of tea now and then; but new life had been infused into him by this unexpected gladness; and as the cook, inspired by success, sent in dish after dish of various viands skillfully prepared, the two feasted together with cheerful converse. Stanley having been rested and Livingstone restored, they formed plans for the future, and explored together the upper part of the lake. Stanley had been prostrated with fevers, had been delirious again and again; but what were all these things in comparison with his joy in the society of the man whom he had saved? The time of parting came, and with heartfelt farewells he set out on his return. When he reached the coast, after an absence of thirteen months, in a full-length mirror he saw another white man, haggard and thin, whose dark hair had become gray, and whose personal identity seemed almost lost.

*Stanley's second expedition.* After witnessing the burial of Livingstone in Westminster abbey, Stanley, seized with a resolute purpose to take up the unfinished work of African exploration, was asked by the editor of the *London Telegraph*, "Could you and would you complete the work? and what is there to be done?" His answer was, "The outlet of lake Tanganyika is undiscovered. We know nothing, scarcely, concerning lake Victoria, not even whether there be one lake or many; therefore the sources of the Nile are still unknown. And the western half of the continent is a blank." The editor asked, "Do you think you can settle all this if we commission you?" "While I live," was the reply, "there will be something done. If I survive long enough all shall be done." A telegram was sent to the *N. Y. Herald*, "Will you join the *Telegraph* in sending Stanley out to A. to complete Livingstone's work?" and the answer came back, "Yes. Bennett." The expedition thus commissioned left the eastern coast of A. Nov. 17, 1874.

Its first great object was to reach the Victoria lake, the distance to which proved to be 720 m. This was accomplished in 103 days. At first the way led along beautiful level land, varied with pleasant valleys and gently rising hills. Soon the scenery became more striking, and mountain summits appeared all around. Between 300 and 400 m from the coast the route turned to the n., and for about 150 m. in that direction the march was difficult and calamitous. The elevation of the road increased, dense thickets were traversed, food almost failed, many of the men were sick; Stanley himself was feverish and weak, and one of his highly valued young English helpers died. At length Stanley reached Mombiti, the entrance to a rich country which extended to the Nyanza. There abundant and varied stores of food were obtained. A wide prospect cheered the eye, presenting hills, rocks, springs, and a verdant plain covered with flocks and herds. After the great lake was reached the next thing was to ascertain its size by attempts to sail round it. The English boat that had been constructed in sections was put together and prepared. Twelve of the best men were placed on board, and the voyage was commenced along the eastern shore and around to the n. and w. In two months the whole distance of a thousand m. was traversed. The fact was settled that there is one vast lake whose superficial area is 21,500 sq. m. Its surface is more than 4000 ft. above the level of the sea. Not far from the shore on the s., w. and e. the depth is 275 ft., 338 ft., and 580 ft. Near the shore, all round, is a succession of islands, a few of them quite large and many very small. On these are vast numbers of crocodiles, hippopotami, smaller lizards, and other animals. Adjacent to the lake are rocky heights, interspersed with fertile lands. In the distance lofty mountains rise. Parts of the shore appeared to be almost without inhabitants; other parts were very populous. Some of the inhabitants were hostile and treacherous; others friendly and guileless. At the north-western corner of the lake is the territory of Mtesa, the most powerful king of equatorial A. The interesting narrative given concerning him shows that he is a man of unusual ability, capable of great kind-

ness and warm friendship, but also subject to furious storms of passion, terrible to encounter, or even to behold. From first to last he was a firm friend to Stanley, valuing highly the information and the presents which the traveler brought, and imparting all the help in his power. Born and reared a barbarous pagan, he had embraced the Mohammedan religion, apparently because convinced that it was better than his own. Stanley seems to have been wise as well as zealous in instructing him in the great facts of the Christian faith, and to have been much encouraged by his professed conviction that what he heard was good and true.

When the exploration of the Victoria Nyanza had been completed, the expedition set out to visit the Muta Nzige, a lake on the w. which is supposed to be connected with the Albert Nyanza. King Mtesa furnished a large and, to all appearance, powerful escort; strictly ordering its commander to do everything possible for the protection and assistance of his friend. The mountainous region between the lakes is described as the Switzerland of equatorial A. Its highest summit, which has been named the Gordon Bennett, rises 15,000 ft.; Mt. Edwin Arnold is 9000 ft. high, and Mt. Lawson 11,900 ft. The people around the lake exhibited manifest tokens of hostility, and the escort becoming frightened refused to remain even for two days, within which time Stanley might have commenced the work of exploration, and afterwards could have continued it without help. For those two days he offered to pay one fourth of all the property of the expedition. But terror prevailed over avarice; consequently he was obliged to abandon his object and return to the Nyanza. On his way along its western coast he examined particularly the Alexandra Nile, which proved to be the largest affluent of the lake. As he pressed on in order to find an open road to the w. the demands of the kings and chiefs became so exorbitant and reiterated that it was impossible to proceed in that direction. He therefore again turned to the s. He was then on the summit of a ridge 5600 ft. above the level of the sea. As this was the water-shed between the Victoria and Tanganyika, we may here sum up the result of the search for the sources of the Nile so far as they are connected with the Victoria.

1. On the eastern side of it,  $5\frac{1}{2}^{\circ}$  s. of the equator, little streams appear which form the head-waters of a river flowing towards the n. and called at first the Leewumba, afterwards the Monangah, and finally the Shimeeyu, under which name it enters the Victoria lake at the s.e. as one of its principal affluents.

2. On the water-shed between the lakes Victoria and Tanganyika two little rills were found, one of which flows towards the Tanganyika; but the other, uniting with similar streams, forms the Alexandra Nile, which becomes the largest affluent of the Victoria, into which it enters from the s.w.

3. The one great outlet on the lake is on the n. by the river which plunges down at Ripon's falls, and, forming a junction with the outlet of the Albert Nyanza, becomes the White Nile, the western branch of the great river whose source was for so many centuries a mystery to the nations that drew sustenance from its waters, and built, conquered, or explored the cities on its banks.

4. The next division of the great work was the circumnavigation of lake Tanganyika. This was commenced at Ujiji and continued towards the s. and w. The mean level of the lake above the sea was 2750 ft. Its area was 9240 sq. m. At Kaboga's headland, one m. from the shore, the depth was 650 ft.; two m. out no sounding was obtained with a line 1200 ft. long; further n. in mid-channel, bottom was not touched at nearly 1800 ft. Its length is 350 m.; breadth from 15 to 60 m.

5. The last and, as it proved, by far the most arduous portion of the work was to follow the Lualaba through its course in order to test the correctness of Livingstone's opinion that it flowed to the n. and e. and became finally the great Nile. Crossing the Tanganyika again, the expedition started towards the w. and n. From the time the water-shed was passed the scenery became more impressive. Streams poured down from the mountains; hills and ridges bloomed; vegetation breathed perfume; rocks were covered with garlands and trees with moss. Yet nature was gigantic as well as bountiful. Grapes were coarse, reeds tough, vines thick and long, thorns sharp as steel. The river Luama was followed to its junction with the Lualaba. The latter at this point is 1400 yards wide. Its appearance was hailed with shouts of joy. It had never been traced w. of Nyangwe. The problem now was to find its end, either in the Nile or in the south Atlantic. To the e. 830 m. of territory had been explored; on the w. 900 m. were absolutely unknown. Would this river lead e. or w.? Would following it flash light across the western half of the dark continent? At Nyangwe Stanley secured the services of Tippu-Tib, an Arab chieftain, who had been Cameron's guide across the Lualaba. For \$5000 he agreed to escort the expedition to the distance of 60 camps, the space from one to another being a four hours' march.

From the outset the journey was very toilsome; dense thickets saturated with heavy dew, and woods high and close had to be traversed. The boat-bearers were wearied out, the men murmured loudly. Tippu-Tib demanded that the contract should be dissolved, declaring he had no idea that there was such a region in the world. After full consideration Stanley resolved to change his plan, and take the great river for his road. Canoes were obtained from the natives and repaired. The native escorts were paid off and released from further service. One hundred and fifty persons embarked at Vinya Njara, Dec. 28, 1876. Instead of attempting to follow the voyagers through all the details of

their course, let us attend briefly to the knowledge of the river which they obtained, and to the toil, perils and calamities which they endured.

The course of the river for 240 m. from Nyangwe was towards the n., inclining sometimes slightly towards the e.; so that to that point there was little to contradict Livingstone's opinion that it would prove to be the Nile. But after passing the 6th cataract the course turned to the n.w., and continued so for about 300 m. The final turn was to the s. and s.w. for about 1000 m. to the Atlantic, as the Congo well known to western commerce. The whole length from the source of the Zambeze s. of lake Tanganyika to the Atlantic is about 2500 m. At Nyangwe the breadth of the river was about three fourths of a m.; at the most northern part of its course the greatest breadth was not less than 7 m. A large portion of the distance is crowded with islands. The toils and perils of the voyage were greatly aggravated by the ferocious hostility of the natives. The men of the expedition were under admirable discipline, and were not allowed to resort to force except in actual self-defence; and every effort was made to conciliate the inhabitants by peaceful salutations, forbearance, justice and generosity. The leader, indeed, gradually acquired a readiness to submit even to any tax, imposition or insolence as the price of a peaceful passage. Yet, in spite of all this forbearance, during their advance from the river Reiki on the e. to Stanley pool on the w., the expedition was engaged thirty-two times in hostile encounters. Many of the assailants were ferocious cannibals, impelled to the attack by their horrid appetite for human flesh. They rejected all offers of presents and of trade with the declaration: "We do not want your friendship or your wares; we will eat you;" and above the din of their war drums arose the frantic cry: "Meat! meat! we shall eat wajiwa meat to-day." The numerous rapids and cataracts in the river greatly increased the difficulty and danger of the voyage. Of these the Stanley falls came first, consisting of seven cataracts within a distance of about fifty m. At the first of them the main stream 900 yards wide, after a mile of rapids, rushed against a lofty ridge which confronted it. To descend by that side was impossible. But on the left was a small stream, about 200 yards wide, down which the boats and canoes were taken as near to the first falls as could be done with safety. At that point a road 15 ft. wide was cut through the impenetrable thicket, and over it the boats were dragged around the falls. This may serve as a specimen of the toil and peril involved in passing the whole seven. Some of the severest battles with the savage cannibals were fought amidst the terrors of the Stanley falls. Of this complicated warfare the passage of the second cataract may give some idea. With thirty-six men, led in a line through the bushes, the savages were driven back. In the meantime, the remainder of the expedition, being divided into two parties to work day and night, formed rude camps around the falls, at intervals of half a mile. Roads were cut from one camp to another. Then by four successive rushes the canoes were dragged from camp to camp, until, after seventy-eight hours of desperate toil, they were launched on the river below the falls. After the Stanley falls had been passed the river flowed on tranquilly for about 900 m.; and after the thirty-two battles had been fought, peaceful tribes were reached. But below the Stanley pool the river became again the great enemy, far fiercer than at first. Before it could enter the Atlantic it had more than a thousand ft. to fall, within a distance of 150 m. Instead of its maximum breadth of 7 m., it rushed down a comparatively narrow gorge, with a steep crooked course, over a succession of cataracts. These were the furious forces with which the battle for life was now waged. Nine men were lost during one afternoon. On one occasion Stanley himself, the "great master," shooting the rapids, was in imminent danger of death; on another, the "little master," the last of the English helpers, in spite of all efforts to save him, was hurried over the terrible "Massassa" falls. Nor did they now fight only against precipices, whirlpools and floods. Famine, their last enemy, stared them in the face. Many from exhaustion were ready to lie down and die. At length, after 28 of the cataracts had been passed, Stanley had certain proof that the Livingstone river had become the Congo, emptying into the Atlantic. The object of his journey having been accomplished, the great mystery solved, the continent crossed, there was no occasion to brave the remaining falls. Emboma, an English trading post, was only 5 days distant; he at once determined to strike for it overland. The faithfully-built English boat which had sailed round the Nyanza and the Tanganyika and down the Livingstone, that had carried, or been carried, over 7000 m., was now, not without some sadness, left high and dry on a rock. The only surviving animal, on which many of the party had ridden, sank down, unable to go on; and the whole remnant of the expedition, wearied, famished and sick in body, but faithful and hopeful in spirit, began their march to the abodes of civilized men. Messengers were sent to Emboma with letters in English, French, and Spanish, saying in substance: "We are here from across A., and are starving. Send quickly food and supplies. Stanley, who found Livingstone." In the shortest time possible all needed things and many luxuries were sent. On the arrival of the wanderers telegrams flashed over all the world. Strength and courage were restored to the travelers, and in a British steamship Stanley took the survivors of the faithful band, who had trusted him as their father and obeyed him as their master, safely home to Zanzibar.

Since that time Stanley has renewed the work of African exploration under the auspices of the international association at Brussels. In the summer of 1879 he organized, at Zanzibar, the expedition from Brussels under capt. Popelin, and having seen it start

for the interior by his old road, he sailed from Zanzibar in his steamer the *Albion*, with 34 native followers, and passing through the Suez canal and the Mediterranean, arrived at the mouth of the Congo two years and four months after his descent of the Livingstone. There he was joined by a steam-ship from Antwerp, with a full cargo of goods for the expedition, and also several small river steamers, that can be taken to pieces and do not draw more than 15 in. They are cased with iron, so as to be proof against arrows, spears, and even bullets. No violence is to be used, and whenever rejected by hostile savages, the expedition is to withdraw to seek another road. It has abundant means at its command, and will pay for everything, even for the air if necessary, rather than resort to violence. All the Europeans, under Stanley's orders, are engaged for three years, and among them are carpenters, smiths, sail-makers, and other artisans. The steam launches are to serve as advance pickets and explorers, while the larger steamer will tow the barges containing the supplies and goods for trade. Never before has so grand an undertaking been attempted in the history of African exploration.

At the present time other explorations are going on in various parts of the African continent, under the direction of parties from Germany, Russia, France, Belgium, Italy, England, Portugal, and Spain.

**AFRICAN METHODIST EPISCOPAL CHURCH.** American Methodists, from the beginning of their history, labored diligently for the conversion and elevation of colored people in the United States, both n. and s., thousands of whom are now in communion with the M. E. church. In 1816, a company of them, with the hope of being freer and more useful as a separate denomination, called a convention in Philadelphia, which organized the African M. E. church. Richard Allen, who had been a Methodist minister for 17 years, was chosen bishop, and was ordained by five presbyters. A second bishop, Morris Brown, was elected in 1828, and a third, E. Waters, in 1836. The doctrines and, with some unessential modifications, the government of the M. E. church are retained. The church has continued to grow, and many of its preachers have been able men. The abolition of slavery, with the kindred changes that accompanied it, has greatly enlarged its territory and added to its members. In 1864, preliminary measures for a union with the A. M. E. Zion church were taken by both parties, to be ratified at the next meeting of their general conferences in 1868. The union, however, did not then take place. In 1876, a plan of union with the independent Methodist church was adopted, to be followed (it was hoped) by the admission of all the independent churches in Canada and the United States. The number of young men who are studying for the ministry is increasing. The *Christian Recorder*, the church newspaper, enlarged and improved, is prepared entirely by colored men. An educational department has been instituted, and the effort to supply the schools with competent teachers of the African race will be diligently prosecuted.

**AFRICAN METHODIST EPISCOPAL ZION CHURCH,** a denomination which had its origin, in 1820, in the secession of the Zion congregation (N. Y. city) from the M. E. church. It was soon joined by other congregations. The next year the first annual conference met in N. Y., attended by 22 ministers, and reporting 1426 members. At first each annual conference appointed its president. In 1838 Christopher Rush was elected superintendent for four years. In 1847 there were two general superintendents, four annual conferences (Philadelphia, Boston, New York, and Baltimore), 75 traveling ministers, about 200 local preachers and exhorters, 5000 members, 50 churches, and many congregations without churches, located in 11 states, the District of Columbia and Nova Scotia. The general conference of 1864 voted in favor of a union with the A. M. E. church (q. v.), which, however, has not taken place. The doctrines are the same as those of the M. E. church. The chief officers, at first styled general superintendents, but now bishops, are elected for four years, and may be re-elected. At the general conference in 1876 measures were adopted preparatory to a union with the colored M. E. church, and providing (in case the union takes place) for an extension of the bishops' term of office to a lifetime.

**AFRICANUS, SEXTUS JULIUS,** a Christian writer who lived early in the 3d c. at Emmaus, in Palestine. He went to Rome to induce Heliogabalus to rebuild Emmaus, which was destroyed in wars; the town was rebuilt and called Nicopolis. He became a bishop, and wrote a work on chronology, fixing the era of creation 5499 B. C., still recognized as the Alexandrian era. He corresponded with Origen, and disputed the canonicity of the apocryphal book of *Susannah and the Elders*. He is supposed to have died in 232 A. D.

**AFZELIUS, ADAM,** 1750-1836; a Swedish botanist. He studied with Linnæus; in 1785 was demonstrator in the university of Upsal; traveled in England and Scotland, 1789; in Guinea and Sierra Leone, 1798; and was botanist to the Sierra Leone company, making collections and reports. He was secretary to the Swedish embassy in 1797; next year a member of the royal society; also professor of materia medica at Upsal. He wrote many scientific papers, and a notice of the life of Linnæus.

**AFZELIUS, ARVID AUGUST,** 1785-1871; a native of Sweden; first a school-teacher, and then parish priest for near half a century. He wrote poems in 1811, and *Farewell to the*  
U. K. I.—10

*Swedish Harp* in 1848; translated Icelandic sagas, and with Geiger edited *Spanish Folk Songs*. His most valuable work is a *History of the Swedish People*, completed in 1870.

**AGA**, or **AGRA**, the Turkish title of a superior military commander; also of the higher officers of the seraglio.

**AGADES**, formerly a very important city of central Africa, but at present in a declining condition. It is the capital of Afr or Asben (q. v.), and is built upon the eastern edge of a great table-land, at an elevation of not less than 2500 ft., in lat. 16° 33' n., long. 7° 30' e. It holds little intercourse with the northern cities, such as Murzuk, which, indeed, is never visited, except by pilgrims on their way to Mecca; but its merchants still frequent the markets of Katsena, Tasawa, Maradi, Kano and Sokoto. At one time A. was a sort of entrepôt for the vast traffic carried on with Gogo—the ancient capital of the Songhay empire (q. v.)—but the conquest and destruction of this city, the centre of the gold-trade, has fatally injured the prosperity of the former, “cutting away the very roots through which it received life.” A. was founded some hundreds of years ago, in all likelihood by the Berbers, who were expelled by the great Songhay conqueror, Haj, Mohammed Askia, in 1515. Its highest degree of power had been reached previous to this, when it probably contained 60,000 inhabitants. At present it has not more than 6000 or 7000. The language is the Emgedesiye, the same as that spoken at Timbuctoo, with which place, however, it has no intercourse now. There is a large admixture of Berber blood in the people of A. The trade and manufactures are trifling in extent. Dr. Barth is of opinion that A. would form, for a European agent, a very good and comparatively healthy place from which to open relations with central Africa. (See Barth's *Travels in Central Africa*, vol. i.)

**AGADIR'**, or **SANTA CRUZ**, a sea-port in northern Africa, on the Atlantic, 30° 27' n., 9° 36' w. It was the Santa Cruz of the Portuguese in the 16th c. In 1778, during a revolt, A. was captured, and the inhabitants were removed to Mogador by Sidi Mohammed. A. has one of the few good harbors in Morocco.

**AGALACTIA** (Gr. *a*, not, and *galacté*, milk), a want of the due secretion of milk. It may depend either on organic imperfection of the mammary gland, or upon constitutional causes. In the latter case, the secretion may often be excited by warmth and moisture, by the stimulus of the act of sucking, and if this fail, by the application of the leaves of the castor-oil plant to the breast.

**AGAMA**, a genus of saurian reptiles, the type of a family called *agamidae*. The agamas are allied to the iguanas, and have a lax skin, which they have the power of inflating with air. None of them are of a large size. They are found in warm climates, and are of various habits, some of them living in trees, and others confined to the ground. The Egyptian A. (*A. Egyptiaca* or *Trapelus Egyptiacus*) is remarkable for changing color, like the chameleon. Some of the most common lizards of Australia are of this family. The frilled A. (*chlamydosaurus*) is a remarkable Australian lizard, having a sort of frill around the neck, which usually lies back in plaits, but is raised when the animal is alarmed.

**AGAMEMNON**, son of king Atreus, and brother of Menelaus. After his father's death, he reigned in Mycenæ, and married Clytemnestra, by whom he had three children—Iphigения, Electra, and Orestes, afterwards celebrated in the Greek drama. When Paris, son of the Trojan king, Priam, seduced and carried away Helena, the wife of Menelaus, A., with his injured brother, made a tour throughout Greece, exhorting all the leaders of the people to unite their forces in an expedition against Troy. Having gained their alliance, A. was appointed general-in-chief of the united forces assembled at Aulis in Bœotia, where they were delayed some time. In the following campaign against Troy, which forms the subject of Homer's *Iliad*, A. is described as a very stately and dignified character. After the fall of Troy, he returned home, taking with him Cassandra, the daughter of Priam. Shortly afterwards, he was murdered by Clytemnestra, aided by Ægisthus, in whose care he had left his wife and children. A tragical fate had always lowered over the house of A.; and the destinies of his children—Iphigения, Electra, and Orestes—were the favorite subjects of the Greek drama.

**AGAMENTICUS, MOUNT**, a hill in York co., Me., 4 m. from the sea; 673 ft. high; noted landmark for sailors. Its exact situation is 43° 36' n. and 70° 41.3' e.

**AGAMI** (*psophia*), a genus of South American birds, allied to cranes. Only two species are known. They are sometimes called *trumpeters*, from a peculiar sound which they make. The best known species is the gold-breasted trumpeter (*P. crepitans*), which is of the size of a large pheasant, but with much longer legs and neck, and a very short tail. It runs very quickly; so much so, that a tame one in England has been known to keep up with the hounds. It is capable of the most perfect domestication.

**AGANIPPE**, a fountain in Bœotia, near mt. Helicon, flowing to the river Parnassus. The water was sacred to the muses, and gave poetic inspiration. There was a fabled nymph Aganippe, daughter of the river.

**AGAPE** were love-feasts, or feasts of charity, usually celebrated by the early Christians in connection with the Lord's supper. The name is derived from the Greek word *agape*, which signifies love or charity. At these feasts, the rich Christians presented their poorer brethren in the faith with gifts, and all ate together, in token of their equality

before God and their brotherly harmony. The meetings were opened and closed with prayer; and during the feast, spiritual songs were sung. At first, a bishop or presbyter presided, who read a portion of scripture, proposed questions upon it, and received the various answers of the brethren. Afterwards, whatever information had been obtained regarding the other churches, was read—such as the official letters of overseers, or private communications from eminent members; and thus a spirit of practical sympathy was engendered. Before the conclusion of the proceedings money was collected for widows, orphans, the poor, prisoners, and those who had suffered shipwreck. Then the members embraced, and the feast was ended with a "philanthropic prayer." As early as the 2d c., the custom of celebrating the A. and the Lord's supper together had ceased, on account of the persecutions. Justin, when writing on the latter subject, does not speak of the former; but Ignatius, on the other hand, seems to regard them as identical. Generally, the feast of the A. preceded the celebration of the Lord's supper. But during the period of the persecutions, when the Christians had often to hold divine service before dawn, the A. were, for the most part, delayed till the evening. Later, a formal separation was made between the two rites. In the 3d and 4th centuries, the A. had degenerated into a common banquet, where the deaths of relatives, and the anniversaries of the martyrs, were commemorated, and where the clergy and the poor were guests; but with the increase of wealth, and the decay of religious earnestness and purity in the Christian church, these A. became occasions of great riotousness and debauchery. Councils declared against them, forbade the clergy to take any share in their celebration, and finally banished them from the church. At the same time, it must be admitted that the heathens ignorantly calumniated the practices of the Christians in these A., and that the defenses made by Tertullian, Minucius, Felix, Origen, etc., are eminently successful. The Moravians have attempted to revive these A., and hold solemn festivals with prayer and praise, where tea is drunk, and wheaten bread, called love-bread, is used.

**AGAPEMONE** (Gr. love-abode), a conventual establishment of a singular kind, consisting of persons of both sexes, founded at Charlynch, near Bridgewater, in the c. of Somerset, by Mr. Henry James Prince, formerly a clergyman of the church of England. The inmates belong to a new religious sect originating with Mr. Prince, and a Mr. Starkey, also a clergyman, and are sometimes called Lampeter brethren, from the place where Prince was educated, and where, while a student, he formed a revival society. The adherents of the sect generally, of whom there are many in the south-western counties, are known as Princeites or Starkeyites.

From Mr. Hepworth Dixon's curious book on *Spiritual Wires* (2 vols. 1868) we learn that Prince was born at Bath in 1811, studied first for the medical profession, and actually passed Apothecaries' hall in 1832; but that, being of a singularly religious and even mystical spirit, he resolved, after a lapse of nearly three years, to become a clergyman. To this he was perhaps the more naturally disposed that he had been a martyr to ill-health from his youth. At Lampeter, where his reputation for piety and learning was great, he began to use language regarding himself, in the meetings of his fellow-students, in which one can see the germs of his subsequent extraordinary beliefs. On leaving college, he became curate of Charlynch, and succeeded in bringing round to his opinions, among others, his own rector, the Rev. Samuel Starkey. But the sensation excited by his preaching alarmed his bishop, and Prince accepted a curacy on the opposite side of England, at Stoke in Suffolk, where, however, his strange theories regarding himself, and the day of grace, and the Holy Ghost, excited prodigious tumult, and led to his dismissal. About the same time his friend Starkey was silenced, and others of the Lampeter brethren were also in difficulties with their ecclesiastical superiors. A conference was held, and it was resolved to formally quit the church. Prince began preaching on his own account at Brighton, and Starkey at Weymouth in Dorsetshire. People of all classes flocked to hear the new preachers; even clergymen's families were infected with the taint of this heresy, which spread through the secluded villages on the coast, obtaining especial hold among the farmers, several of whom, as in the times of the apostles, brought their wealth, and laid it at "brother Prince's" feet—community of goods being the tenet most strenuously insisted upon.

Meanwhile, funds accumulated rapidly. Three of the brothers—Messrs. Prince, Thomas, and Cobbe (brother of Miss Frances P. Cobbe, a well-known writer on social topics)—married three sisters, daughters of a wealthy widow lady named Nottidge. These young women, handsome, clever, and of independent fortune, began by listening, against the wish of their parent, to Mr. Prince's preaching, and finally left their home to marry his disciples. A fourth sister afterwards followed their example. So strong was the feeling under which they acted, that, on their aged mother coming in person to remonstrate on their conduct, they rejected her claims of authority, saying that the devil was speaking to them by her voice. Their money was used by Prince to purchase a fine property at Spaxton, near Charlynch, where the brethren and sisters have lived since 1859, and which is luxuriously fitted up, the church serving also as a parlor, a music-hall, and a billiard-room.

In 1846, however, one of the ladies above mentioned, having become dissatisfied with the doctrine and rule of life in the A., and also (according to Dixon) with Prince's views of property, was expelled from the society, and put away by her husband, Mr. Thomas,

though then about to give birth to a child. After she had lived four years with her mother, who had made provision for the child, Mr. Thomas wrote, renouncing her forever, and claiming the custody of his son. This was resisted; and in the course of the law proceedings, 1850, that took place, much that was offensive in the conduct of the Agapemonians transpired. Although the inmates were married couples, it appeared that they entertained religious objection to the increase of population, as if believing that the perfection of all things will be the extinction of the human race.

Letters intended for Mr. Prince passed through the post office directed to "The Lord;" and his followers have been heard to say that he is their "creator." In 1851, Mr. Prince took up a party of them to London to see the great exhibition. He drove about town and in the parks in a carriage, constantly attended by out-riders, bareheaded, because they were in the presence of "the Lord."

Mr. Prince has put forth many pamphlets, some in the highest degree objectionable; others, in which the tenets of the Christian religion are mingled with his own peculiar doctrines. Christ came to redeem the soul. Prince affirms that *his* errand is to redeem the body, on which an astounding commentary is furnished by the 32d chap. of the first vol. of Mr. Dixon's book. One test applied to his disciples was, that they were to see the eternal punishment of those whom they best loved, and to rejoice in it as redounding to their Master's glory. On this, several declined to proceed further; others agreed to the test cordially. Pain and grief, sorrow and sickness, have forever lost their dominion over the Princeites; yet still, to the incredulous, it appears that consumption, rheumatism, and other infirmities of human nature, do affect them, and that they die, and are buried, like other men. In one of Mr. Prince's latest pamphlets, the following words occur, which may serve to elucidate his somewhat mysterious doctrine: "God in Jesus Christ has again entered into covenant with man at the resurrection of mankind, and this is the first resurrection, and now brother Prince is his witness." "This one man, brother Prince, has Jesus Christ selected and appointed his witness to his counsel and purpose to conclude the day of grace, and to introduce the day of judgment. To close the dispensation of the Spirit—the gospel—and to enter into covenant with flesh."

In 1859 appeared *Brother Prince's Journal, an Account of the Destruction of the Works of the Devil in the Human Soul by the Lord Jesus Christ through the Gospel*. It had been commenced, according to brother Prince, twenty-three years before, and more than nineteen years had elapsed since its completion. Its aim is simply this: to show the work of grace in the writer's soul, from its first struggling manifestations to that absolute harmony in which self is utterly absorbed and swallowed up in God. Brother Prince, at the close of his journal, deliberately states that he considers himself perfect, and incapable of further improvement. These are his words: "Having neither wishes nor desires, my will can have no disposition whatever to move in any one direction rather than another, but like the finely-poised beam of a well-adjusted balance, it hangs delicately suspended on the divine will, in a holy equilibrium of inward passiveness." From an advertisement or manifesto dated August, 1873, we learn that the "residents of the Agapemone" are still preaching, "every Sunday and Wednesday," the everlasting damnation of all who do not believe in their incomprehensible jargon.

It would appear that a society, similar in its aims and character, though not conventual in its form, existed in England in the 16th and 17th cs. It was called the "family of love." Its founder is generally supposed to have been Henry Nicholas, a native of Münster, in Westphalia, but who lived a considerable time in Holland. He held himself to be greater than Moses or Christ, for the former only taught men to *hope*, and the latter to *believe*, while he first announced the doctrine of *love*. He made his appearance about 1540. Others, however, are of opinion that the real father of this "family" was one David George, a fanatical Anabaptist of Delft, in Holland, who died in 1556, and who imparted his "damnable errors" to Nicholas, an old friend of his. In the reign of Edward VI., according to Fuller, Nicholas came over to England, and commenced the perversion of silly people in a secret way. By 1572, they had apparently increased in numbers considerably, for in that year one John Rogers published a work against them, entitled, *The Displaying of an Horrible Secte of Grosse and Wicked Heretiques, naming themselves the Family of Love, with the Lives of their Authors, and what Doctrine they teach in Corners*. In 1580, queen Elizabeth issued a proclamation for the hunting out and punishing of the "damnable sect." The family of love, "or lust, rather," as old Fuller has it, tried to insinuate themselves into the good graces of king James, by presenting a petition, casting aspersions on the Puritans. At length, the society expired from continual exposure to the effects of ridicule in prose and verse, as well as from its own intrinsic worthlessness. Their doctrines seem to have been a species of pseudo-spiritual sentimentalism, resulting in gross impurity. (See MUCKERS.)

AGAPETÆ, widows and virgins among the early Christians who devoted themselves to attendance upon ecclesiastics. Immorality followed, and the early councils denounced the practice.

AGAPETUS, a deacon of St. Sophia's church at Constantinople, who presented to Justinian, in 527, a work on the duties of a Christian prince. It is highly valued, and has been often reprinted.

AGARDE', ARTHUR, 1540-1615, an English antiquarian. He was bred to the law, and became deputy chamberlain, holding the office 45 years, in which time he became proficient in antiquarian knowledge. Camden and Sir Robert Cotton were his personal friends, and with them he was among the first members of the royal society of antiquarians.

A'GARDH, JAKOB GEORG, b. 1813; son of Karl Adolph, and followed the same study. He was professor of botany at Lund in 1854. He much increased his father's large collection, and wrote several botanical works.

A'GARDH, KARL ADOLPH, 1785-1859; a Swedish botanist. He was educated at Lund. In botany he paid special attention to cryptogamia, on which he is authority. In 1812 he was professor of botany and rural economy at Lund, and lectured on general economics. He became a priest in 1816; went into politics in 1817, and was elected to the diet; in 1834 was made bishop of Karlstadt, and was the leading liberal in the diet. A. was author of several books and papers chiefly on botany, and a memoir of Linnæus.

AG'ARIO and AGAR'ICUS. See MUSHROOM.

AGA'SIAS, a Greek sculptor, supposed to have lived in the 4th c. B.C. The "Borghese Gladiator," one of his works, was found at Antium with the "Apollo Belvidere," and is now in the Louvre. It is a warrior on foot with head raised as if on guard against a horseman. Some suppose it represents Achilles, the invisible enemy being Penthesilea.

AG'ASSIZ, ALEXANDER, b. Switzerland, 1835, son of Louis, and joined his father in Boston in 1848. He graduated at Harvard in 1855, and was in the U. S. coast survey off California in 1859-60, studying the fauna of the Mexican coast. Subsequently he became largely interested in copper mining, and gave his attention successively to such scientific work as was involved in the positions of curator of the museum of comparative zoology, superintendent of the Anderson school of natural history, member of the scientific expedition to Chili and lake Titicaca, chief of the U. S. dredging expedition in the West Indies, and one of the overseers of Harvard college. He is a member of a great number of scientific societies, and has written largely upon ichthyology. He has also received prizes for success in zoological investigations.

AG'ASSIZ, LOUIS JOHN RODOLPH, one of the most distinguished of modern naturalists, was born at Orbe, in the canton de Vaud, in 1807. After passing through the usual course of elementary learning at Biel and Lausanne, he prosecuted his studies at Zurich, Heidelberg, and Munich. In early youth he had displayed a strong love of natural history; and at Heidelberg and Munich comparative anatomy was his favorite occupation. In Munich he became acquainted with Martius and Spix, the well-known travelers in Brazil; and when Spix died (in 1826) his collection of 116 species of fish, collected in Brazil, was left in the care of A., who published it under the title *Pisces, etc., quos collegit et pingendos curavit Spix, descripsit A.* (Munich, 1829-31, with 91 illustrations in lithography.) Led by this work to study ichthyology more closely, A. next undertook a systematic arrangement of the fresh-water fishes found in central Europe. Of this work, the first fasciculus, containing the family of the Salmonidæ, appeared at Neuchâtel in 1839, with 34 illustrations, and descriptions in French, English, and German. A second fasciculus, prepared by his friend Vogt, *Embryologie des Salmones*, was published in 1840; and a third, *Anatomie des Salmones*, appeared in 1845 as a part of the third volume of the *Memoirs of the Neuchâtel Society of Natural History*. Beyond this, the work was not continued. A. at the same time devoted his attention to the fossil remains of fishes, and during his stay in Paris (1831-32), examined several private and public fossil collections. The results of his studies were given in his work *Recherches sur les Poissons Fossiles*, published at Neuchâtel, with 311 lithographed illustrations, (1833-42.) Meanwhile he had been invited to take the professorship of natural history at Neuchâtel; and here he found two active young friends, Desor and Vogt, who afforded considerable aid in the completion of his works. With their assistance his work on fossil fishes was brought to a conclusion in 1842. During several visits to England, A. made himself well acquainted with the collections of fossils in this country; and in 1844 published a monograph on fossil fishes found in the old red sandstone of the Devonian system. His study of these remains led him to examine other fossils; and the results appeared in his works *Description des Echinodermes Fossiles de la Suisse*, and *Monographies d'Echinodermes Vivants et Fossiles*. In the latter work, Professor Valentin, of Berne, supplied the section on the "Anatomy of the Sea-urchin." A. next turned his attention to the mollusca, and produced his *Critical Studies on Fossil Mollusca*, which was soon followed by his *Memoirs on the Muscles in Living and Fossil Mollusca*. His work on *Glaciers* excited great interest, as it opened new views in geology. The results of further study were given in a second work on *The System of Glaciers; or Researches on Glaciers* (Paris, 1847). In preparing this work, he was assisted by his friends Guyot and Desor. In 1846, A. went to North America, where he was appointed to a professorship in Harvard college, near Boston; from which he was subsequently translated (1852) to the chair of comparative anatomy in Charleston; but this he resigned (1854), and returned to Harvard. In *Outlines of Comparative Physiology*, A. upholds the doctrine of the successive creation of higher organized beings on the earth. An *Essay on Classification*, by A., was

published (Lond., 1859); and a *Journey in Brazil* (1868). During the latter of these years, he was appointed a non-resident professor and lecturer in Cornell university, Ithaca, N. Y.; and, along with count Portalés, was intrusted with the dredging operations in the investigation of the Gulf Stream, undertaken by the American government in 1871. His last work was the establishment of a school of natural history on the island of Penikese, presented to him by Mr. John Anderson. He died in Dec., 1873.

AG'ASSIZ, MOUNT, in Arizona, 70 m. n.e. of Prescott; an extinct volcano, 10,000 ft. above the sea-level. It is a favorite summer resort, and near it is the wonderful canyon of the Colorado.

AG'ATA DE GO'TI, SANTA, a t. of south Italy, in the province of Benevento, 14 m. e. from Capua. It is situated on a hill of volcanic rock, surrounded by the Isclero, an affluent of the Volturno. It is an episcopal seat, and has a cathedral, seven other churches and an abbey. Pop. 5000.

AG'ATE, a mineral composed of layers of quartz, generally of different varieties or colors, intimately joined together. The layers are often concentric, and in the section sometimes appear nearly circular or elliptical, sometimes angular. Chalcedony, amethyst, common quartz, jasper, flint, etc., occur as layers in A. It takes a fine polish, and is much used for ornamental purposes. It is common in amygdaloids. Many agates are found in Scotland, and are sold under the name of *Scotch pebbles*.

AG'ATHA, SAINT, a noble Sicilian lady of great beauty, who rejected the love of the prefect Octavianus, and suffered a cruel martyrdom in the persecution of Christians under Decius (250). She holds a high rank among the saints of the Roman Catholic church; her day falls Feb. 5.

AGATHAR'CHIDES, or AGATHARCHUS, a Greek grammarian and geographer, who lived about 130 B.C. He was guardian of an Egyptian king, probably Ptolemy Soter II. A. was an orator, and wrote several works, of which only one remains.

AGATHAR'CHUS, 420 B.C.; a Greek painter; said to be the first who applied the laws of perspective. He painted a scene for a tragedy by Æschylus, and is called the first scene-painter.

AGA'THIAS, surnamed ASIANUS; 536-580 A.D.; educated at Alexandria and Constantinople; studied Roman law and practised with success; wrote love verses and made an anthology of earlier poets; but his most valuable work is a history of the years 553 to 558, in which he tells of the conquest of Italy by the Goths, of the earthquakes of 554 and 557, the beginning of the Greek and Persian war, the rebuilding of St. Sophia, the exploits of Belisarius, etc.

AGATH'OCLES, one of the boldest but most unworthy adventurers of antiquity, was b. at Thermae, in Sicily, in 361 B.C. He rose from humble circumstances through the patronage of Damas, a noble citizen of Syracuse, and received a command in the expedition against Agrigentum. Afterwards he married the widow of Damas, and became one of the most wealthy men in Syracuse. Under the rule of Sosistratus, he was obliged to flee into lower Italy, where he collected a band of partisans. Returning to Syracuse, after the death of Sosistratus, he gained the supremacy, confirmed it by a massacre of several thousands of respectable citizens, and took possession of the greater part of Sicily. To establish his power, and keep his army employed, he now attempted to expel the Carthaginians from Sicily; but in this undertaking he was defeated. His next plan was to pass over to Africa with a part of his army and there attack the Carthaginians. This war he carried on with success for four years, or until 307 B.C., when disturbances in Sicily compelled him to leave the army for a time. On his return to Africa he found his troops in a state of mutiny against his son Archagathus, whom he had left in command, but pacified them by promises of large booty. Soon afterwards he suffered a serious defeat, and with deliberate treachery left his own son exposed to the vengeance of the disappointed soldiers. The son was put to death, and the troops surrendered themselves to the enemy, while A. escaped safely into Sicily, where, by fraud and cruelty, he soon recovered his former power, and was afterwards engaged in predatory inroads upon Italy. It was his intention to leave the throne to his youngest son, A.; but his grandson, Archagathus, made an insurrection, slew the royal heirs, and persuaded Maenon, one of the favorites of the aged tyrant, to destroy him by means of a poisoned toothpick. This took place in 289 B.C., when A. was 72 years old, and had reigned 28 years.

AG'ATHON, or AGATHO, 447-400 B.C.; a Greek tragic poet, contemporary and friend of Plato, Socrates, Alcibiades and Euripides; noted for personal beauty. After his first literary triumphs, in 416, a dinner was given to him, which Plato immortalized in his "Symposium," the scene being in A.'s house. He was sometimes ridiculed for bombast and for effeminate tastes, appearing on the stage in female dress.

AGAV'E, a genus of plants belonging to the natural order *amaryllidaceæ* (q.v.), and having a tubular perianth with 6-partite limb, and a triangular, many-seeded inferior capsule. They are herbaceous plants, of remarkable and beautiful appearance. There are a number of species, all natives of the warmer parts of America. By unscientific persons they are often confounded with aloes (q.v.); and *A. Americana* is generally known by the name of AMERICAN ALOE. The agaves have either no proper stem, or a very short

one, bearing at its summit a crowded head of large, fleshy leaves, which are spiny at the margin. From the midst of these shoots up the straight, upright scape, 24 to 36 ft. high, and at the base often 1 ft. in diameter, along which are small, appressed, lanceolate bractes, with a terminal panicle, often bearing as many as 4000 flowers. In S. America, these plants often flower in the 8th year, but in our hot-houses not until they have reached a very advanced age; whence arises the gardeners' fable of their flowering only once in 100 years. After flowering, the plant always dies down to the ground, but the root continuing to live, sends up new shoots. The best known species is *A. Americana*, which was first brought from S. America to Europe in 1561, and being easily propagated by suckers, is employed for fences in Italian Switzerland, and has become naturalized in Naples, Sicily, and the n. of Africa. By maceration of the leaves, which are 5 to 7 ft. long, are obtained coarse fibres, which are used in America, under the name of *maquey*, for the manufacture of thread, twine, ropes, hammocks, etc. This fibre is also known as *pita flax*. It is now produced to some extent in the s. of Europe. It is not very strong nor durable, and if exposed to moisture it soon decays. The ancient Mexicans employed it for the preparation of a coarse kind of paper, and the Indians use it for oakum. The leaves, cut into slices, are used for feeding cattle.—Another species, *A. Mexicana*, is particularly described by Humboldt upon account of its utility. When the innermost leaves have been torn out, a juice continues to flow for a year or a year and a half, which, by inspissation, yields sugar; and which, when diluted with water, and subjected to 4 or 5 days' fermentation, becomes an agreeable but intoxicating drink, called *pulque*, to which the Mexican Indians not unfrequently sacrifice both fortune and life. It is made likewise from *A. Americana*, and from several other species.—The roots of *A. saponaria* are used in Mexico for washing, being a powerful detergent, and forming a lather with salt water as well as with fresh. The juice of the leaves, made into cakes, is used for the same purpose.

**AGDE**, an ancient French t. in the dept. of Herault, founded by the Greeks, and situated about a league from the Mediterranean sea, on the left bank of a navigable stream. To the n., under the walls of the t., flows the Languedoc canal. The mouth of the stream forms a harbor, which is entered by 400 vessels yearly. The coast-trade of A., in particular, is very brisk, while it is also the entrepôt for the traffic of the s. and w. of France. It has, besides, considerable intercourse with Italy, Spain, and Africa. It carries on a large and prosperous trade in wine, oil, salt, corn, timber, wool, silk, and cloth; but the general aspect of the place is sombre and forbidding, on account of the black basalt of which the houses are built, whence it has popularly received the name of the Black Town. It possesses a naval academy, and is noted in history as the place at which Alaric, king of the Goths, convened a council. Pop. '76, 7728.

**AGE**. The legal divisions of human life, being sometimes arbitrary, and sometimes founded on nature, differ considerably in different countries. In England, the whole period previous to 21 years of A. is usually spoken of as *infancy*, a term which has a totally different signification in those countries that have followed the civil law. But notwithstanding this general division, which is common to both sexes, the ages of male and female are different for different purposes. "A male, at 12 years old, may take the oath of allegiance; at 14, is at years of discretion, and therefore may consent or disagree to marriage, may choose his guardian, may be an executor, although he cannot act until of age; and at 21, is at his own disposal, and may alien and devise his lands, goods, and chattels. A female, also, at 7 years of age, may be betrothed or given in marriage; at 14, is at years of legal discretion, and may choose a guardian; at 17, may be an executrix; and at 21, may dispose of herself and her lands. So that full A. in male or female is 21 years, which A. is completed on the day preceding the anniversary of a person's birth, who, till that time, is an infant, and so styled in law."—(Kerr's *Blackstone*, vol. i. p. 493.)

By the law of Scotland, again, life is divided into three periods—*pupilarity*, *minority*, and *majority*. The first extends from birth to the age of legal puberty, which is 14 in males and 12 in females, at which ages they may respectively marry; the second embraces the period from the termination of pupilarity till the attainment of majority, which takes place at the age of 21 in both sexes; and the third includes the whole of after-life. The term minority, however, is often applied to the whole period anterior to majority, and is thus equivalent to infancy or nonage in England. Infancy in Scotland can scarcely be said to possess a technical meaning; but when used at all, it is always in the sense of the Roman *infantia*, to indicate the period from birth till 7 years of age, during which a child, unless in very unusual circumstances, is intrusted to the care of the mother. The office of *tutary* corresponds in duration to pupilarity, that of *curotary* to minority. See **TUTOR**, **GUARDIAN**. By the Roman law, an *approach* to majority was held to modify the character of minority, and so of the other periods; but this rule has not been followed by the law of Scotland; and a youth who wants but a day of 21 is as much incapacitated as if he were 15. In France, the marriageable A. is 18 in males and 15 in females (code civile, art. 144), an arrangement which seems more reasonable than that which we have borrowed from the Romans, and which, however suitable it may have been to the climate of Italy, could never have been free from inconveniences in this country. Twenty-one is generally the age at which men are eligible for public offices; and at this age they may elect and be elected members of parliament. But a man must be 24 before he can be

admitted to priests' orders, and 30 before he can be a bishop. In America, a member of the senate must be 30, and a member of the house of representatives 25; this latter was also the period of majority by the civil law. The legal disabilities attaching to the different stages of minority, or, to speak more correctly, the privileges which the law confers on minors for their protection, will be treated of under the different subjects to which they relate. (See INFANT, GUARDIAN, CONSENT, CONTRACT, CRIME, MARRIAGE, etc.).

AGE, in law (*ante*), is that period of life at which persons are permitted legally to exercise certain rights which for lack of A. they had been restrained from. In general, a person is "of age" on the day preceding the 21st anniversary of birth. The "A. of discretion" is at 14 years for males and 12 for females, at which point either may marry or elect guardians. At full A. (21) male citizens can vote and hold office, except in certain specified cases, such as a representative in congress, who must be 30 years of age, a senator 35, and the president 35. The "military A.," confined to males, is from 18 to 45 years. In N. Y. no judge can hold office after he is 70 years of age; male citizens over 21 and under 60 are subject to jury duty. In mythology and poetic fancy, the course of the world was divided into 5 ages: the golden A., when Saturn reigned, was a period of innocence and happiness; the silver A., under the rule of Jupiter, was the voluptuous period; the brazen A., when Neptune held sway, was a warlike interval; the heroic A. under Mars was also warlike and adventurous; while the iron A., with Pluto as the ruler, was one of human degradation and misery. In chronology we have many ages, the principal being the antediluvian and the postdiluvian. In anthropology there is the A. of stone, the A. of bronze, and the A. of iron, indicated by the use of these substances for tools in successive periods. In geology there are the azoic, the silurian, the Devonian, the carboniferous, the reptilian, the mammalian; and the A. of man, or the present A. In letters there are the A. of Pericles in Greece, the Augustan A. in Rome, the Elizabethan A. in England, and the Augustan A. in France under Louis XIV. There is the heathen as opposed to the Christian A.; the A. of the crusades; the dark A.'s, the middle A.'s and the A. of steam. The progress of mental activity has been divided into the A. of the supernatural, the A. of the metaphysical, and the A. of the positive. Physiologically human life is divided into infancy, youth, manhood, and old A.; in which list some insert the A. of childhood, of boy or girlhood, or adolescence.

AG'ELNOTH, or ETHELNOTH, known also as ACHELNOTUS; s'n of Egelmaer, archbishop of Canterbury in the reign of Canute. A. exercised great and salutary influence over that headstrong monarch, both to prompt and to restrain, counselling the policy that finally united the Danes and Saxons to oppose the Normans. He also made peace in the church, and ended the persecution raging between the Benedictines and the secular clergy. He was made archbishop, and went to Rome in 1022 to receive the pail. On his return he purchased at Pavia a relic, said to be the right arm of St. Augustine of Hippo. When Canute died he made A. promise to be faithful to his sons by Emma, and the promise was so well kept that Harold the usurper remained unconsecrated until after the death of A.

AGEN', the chief t. of the department of Lot-et-Garonne in France, is situated in a fertile region on the right bank of the Garonne. The town is old and gloomy in appearance; but carries on an active trade in woolen and linen fabrics, leather, colored paper, colors, cordage and sail-cloth. It forms the connecting-link of the intercourse between Toulouse and Bordeaux, and exports plums, brandy, hemp, flax and poultry. Close by it is the old-fashioned house in which Joseph Scaliger, the prince of scholiasts, was born. In ancient times A. was the scene of many a fierce martyrdom of the Christians, when it was under the rule of Roman prætors. Afterwards it suffered the miseries of war, during the barbaric irruptions from Germany, to a most incredible extent, having been taken and plundered by Goths, Vandals, and Huns, in their turn. Next it came under the thralldom of the English, in their early French wars, and, at a later period, was twice taken by the Huguenots, in the religious contests of the 16th c. Pop. 76, 17,806.

AGENOR, a fabulous king of Phœnicia, son of Neptune, twin brother of Belus; father of Cadmus, and some say of Europa. When Europa was carried off by Zeus, A. sent his sons to find her, with orders not to return until they had done so. She was not found, and the sons settled in various countries. Buttman supposes A. to be the Canaan of Moses (Gen. x. 6).

AGENT (Lat. *agens*). An A. is one who is authorized or delegated to transact business for another (who in this relation is called his principal or constituent) in whose place he comes, and who is bound by his acts in the business to which the agency extends. The appointment of an A. may either be *general*, having reference to all the principal's affairs, or *special*, concerning some particular object. It may further be *limited* by instructions as to the conduct he is to pursue, or *unlimited*, in which case his conduct is left to his own discretion. Even in the last case, however, the A. is not freed from all responsibility for his conduct; he is bound to do his best for his employer, and he ought not to accept or retain the agency unless he is competent to its performance. The mutual relations of principals and agents, and their respective responsibilities to the public in mercantile

transactions, will be treated under PRINCIPAL AND AGENT. See also FACTOR, BROKER, COMMISSIONER, COMMISSION-MERCHANT OR AGENT.

**AGENT and CLIENT.** The employer of a law-agent is entitled to presume that he is possessed of competent professional knowledge, and the A. is consequently responsible to his C. for the consequences of gross professional ignorance, or flagrant negligence in the conduct of the business intrusted to him. It is not enough to entitle the C. to damages that the A.'s proceedings have not had the effect which was expected, or which he himself predicted from them. It has been observed in the house of lords, that it is of the very essence of an action against a professional man by his employer, that there shall be *gross ignorance* (*Purves v. Landell*, 4 Bell, 46). (See ATTORNEYS AND SOLICITORS, WRITER TO THE SIGNET.)

**AGENT, ARMY.** A person authorized by the government to manage the monetary affairs of regiments in the army, as a kind of military banker. In early times, persons were employed to effect the purchase and sale of commissions in the British army (the only army in which this strange system of purchase existed), without much reference to honesty or fitness; but to prevent pernicious trafficking, no one was after 1809 permitted to manage these transactions except the authorized A.A., under a heavy penalty. The A.A. were also bound down by restrictions, in relation to any pecuniary advantage derivable by themselves from the sale and purchase. Their business, however, is now confined to the regular expenditure of government money. Every regiment has an agent, selected by the col., and empowered by him to be his representative in the monetary arrangements of the corps. The col. is responsible to the crown for the honesty of the A.A.; but the A. is in many ways regarded as a servant of the public. When money is wanted for the regular expenses of the regiment, the agent applies to the war office; whereupon the secretary of state for war issues an order to the paymaster of the forces to advance the requisite sum; the paymaster does so, and takes a receipt from the A. There is an annual settlement of accounts between the paymaster and the A., each one paying or receiving, according to the side on which excess or deficiency may appear. The A. then distributes the pay and other charges of the regiment. The tendency of recent alterations has been greatly to reduce the public functions of the A., who now only receive £15,000 from the state, while in 1858 they had £40,000. The percentage allowed to A.A. for their trouble in paying the full pay of officers was allowed for by the state, and was included among the annual army estimates; but the officer generally bore this charge in relation to half-pay and allowances. The A.A. conducted all correspondence, and sent all the requisite notices concerning pay and payment; the col. of the regiment took no part in the matter. The details of the system varied considerably at different times, and in different portions of the British dominions. Sometimes the A. received twopence in the pound on the amount of pay; sometimes three-halfpence in the pound, with an addition varying from sixpence to one shilling per day for each company of infantry or troop of cavalry; sometimes (in Ireland and in the colonies) a fixed annual salary. When the cols. of regiments provided the men's clothing, under a system now abandoned, the A.A. were very intimately mixed up with the transactions; but at present the duties of those agents are limited to the following: applying monthly to the war office for the money required for each regiment; receiving that money; applying part of it to the payment of officers; disbursing the regimental paymasters' bills for the cost of the expenditure; paying soldiers' remittances for the benefit of their families; settling the effects and credits of soldiers. Many experienced government officers have recommended the abandonment of the system, and the paying of all moneys by the war office direct, as a measure of simplification and economy.

**AGENT, NAVY,** a banker and attorney for naval officers, who bears some such relation to admiralty expenditure as the army A. (q.v.) to war-office expenditure. By the act 27 and 28 Vict. c. 24 (1865), each of her majesty's ships of war, while in commission, has an agent appointed by the commander, and registered. His duties are to act for the ship in cases of salvage, merchant shipping law, distribution of prize-money, capture of slave-ships, etc. He receives two and a half per cent. as payment in full of his services. The *Navy List* for 1875 contained the names of 11 navy and prize agents.

**AGES,** a term employed to designate the epochs of civilization in the history of the human race. The old poets and philosophers described these in harmony with what they conceived to have been the moral and political condition of their ancestors. The idea of a succession of A. presented itself at a very early period to the Greek mind. The life of the race was likened to that of the individual—hence the infancy of the former might easily be imagined to be, like that of the latter, the most beautiful and serene of all. Hesiod mentions 5 A.—the golden, simple and patriarchal; the silver, voluptuous and godless; the brazen, warlike, wild and violent; the heroic, an aspiration towards the better; the iron, in which justice, piety and faithfulness had vanished from the earth, the time in which Hesiod fancied that he himself lived. Ovid closely imitates the old Greek except in one particular—he omits the heroic age. This idea, at first perhaps a mere poetic comparison, gradually worked its way into prose, and finally became a portion of scientific philosophy. These A. were regarded as the divisions of the great world-year, which would be completed when the stars and planets had performed a revolution round the heavens, after which destiny would repeat itself in the same series of events.

Thus mythology was brought into connection with astronomy. The golden A. was said to be governed by Saturn; the silver, by Jupiter; the brazen, by Neptune; and the iron, by Pluto. Many curious calculations were entered into by ancient writers to ascertain the length of the heavenly year, and its various divisions. The greatest discrepancy prevailed, as might naturally be expected: some maintaining that it was 3000, and others as many as 18,000 solar years. The Sybilline books compared it to the seasons of the solar year, calling the golden age the spring, etc.; and on the completion of the cycle, the old order was renewed. The idea of a succession of A. is so natural, that it has inwrought itself into the religious convictions of almost all nations. It is sanctioned by scripture, for it is symbolically adopted in the Apocalypse to a certain extent; it also manifests itself in the sacred books of the Indians. Modern philosophy, at least in Germany and France, has also attempted to divide human history into definite A. or periods. Fichte numbers five, of which he conceives that we are in the third; Hegel and August Comte reckon three, placing us in the last. Fortunately, the course of history is not arrested by such speculations, but proceeds in quiet indifference to all metaphysical dogmatism.

**AGESILATUS**, king of Sparta (390-360 B.C.), was elevated to the throne chiefly by the exertions of Lysander. Being called upon by the Ionians to assist them against Artaxerxes, he commenced a splendid campaign in Asia; but was compelled by the Corinthian war, in which several of the Grecian states were allied against Sparta, to leave his conquest over the Persians incomplete, and return to Greece. At Chæronea (334 B.C.), he gained a victory over the allied forces, and in 378 the war was concluded by a treaty of peace in favor of Sparta. Afterwards, in the Theban war, though hard pressed by Pelopidas and Epaminondas, he bravely and ably defended his country. He died in his 84th year. A. is described as of small stature but commanding aspect, blameless in his private character, and, in public life, just, as far as his partiality for his own country allowed. His biographers are Xenophon, Plutarch, and Cornelius Nepos.

**AGGERHUUS**, or **AKERSHUS**, a department in s.e. Norway, 2012 sq. m., pop. 164,804. The chief business is in iron, lumber, pitch, tallow and hides. The district has many small lakes, and the scenery is beautiful.

**AGGLUTINATE LANGUAGES**, the name given to the Turanian tongues, because the pronouns are attached (glued on) to the verbs, and prepositions denoting case in the same way attached to substantives.

**AGGREGATION, STATES OF**; the three states, solid, liquid and gaseous, in which matter occurs, depending upon the degree of cohesion that exists between the molecules or atoms of material bodies. In a solid state the molecules are fixed, and cannot be changed from their position without force; in the liquid state they move freely on each other, and the cohesion is so slight that the body has no fixed form; in the gaseous state they are affected by an elastic force that amounts to repulsion, tending to disperse them through increased space. A recent hypothesis, to which some facts seem to point, is that of a fourth state of matter, called "radiant," in which it is supposed to exist at a point as far beyond the gaseous as that is beyond the liquid.

**AGHMAT**, or **AGHMET**, a fortified t. of Morocco, the capital of a province, on the left bank of the Enfis, a tributary of the Tensift, on the n.w. slope of mt. Atlas, 24 m. s. from Morocco. Pop. 6000, of whom about 1000 are Jews. A. is said to have been at one time the residence of the Moorish emperor.

**AGINCOURT**. See **AZINCOURT** (*ante*).

**AGIO**, an Italian word, signifying "accommodation," was first used in Italy to denote the premium taken by money-changers in giving gold for silver, on account of the greater convenience of gold for transport. The same word is now used to denote the difference between the real and the nominal value of money; also the variations from fixed pars or rates of exchange. It corresponds very nearly to the English word "premium."

**AGIS**, the name of several kings of Sparta. Mention is made of a king A. as early as about 1000 years B.C., who subdued the old inhabitants of Sparta, and made the Helots vassals or slaves. Of the others, A. I. reigned during the greater part of the Peloponnesian war, from 420 to 397 B.C.—A. II. ascended the throne in 338 B.C. His hatred of the Macedonian supremacy led him to form alliances with several Persian satraps against Alexander the great. A., after extending his conquests to almost all the cities of Peloponnesus, fell in battle 330 B.C.—A. III. came to the throne in 244 B.C., when the state of Sparta had fallen into a ruinous condition through long-continued war. Though only twenty years old when he began to reign, he boldly resolved to restore the old institutions and severe manners of Sparta; but intrigues and self-interest in the higher classes frustrated his designs. The riches of the state were now in the hands of a few persons, while a great majority of the people were in extreme indigence. A., therefore, in accordance with the old laws of the state, proposed a redistribution of landed estates by lottery. The new ephorus, Agesilaus, who was rich in landed property, but burdened with many debts, astutely proposed that first all debts should be canceled, and next the lands should be divided. The first part of this plan was soon effected; but great hindrances were opposed to the carrying out of the remainder. Meanwhile, the disappointed people were easily persuaded that A. had endeavored to introduce measures inimical to the wel-

fare of the state. Pursued by his enemies, he fled for refuge to a temple, but was betrayed by false friends into the hands of the magistrates, who immediately ordered him to be put to death by strangulation (240 B.C.). His mother and his grandmother, who had favored his measures, were barbarously executed in the same manner. Alfieri, the Italian poet, wrote a powerful tragedy on the fate of A. III.

AGLA'OPHON, a Greek painter, who lived about 500 B.C.; father of Polygnotus and Aristophon, also painters and his pupils. Quintilian praises A.'s pictures for simplicity of coloring. Another artist of the name, supposed to be a grandson, painted a portrait of Alcibiades.

AGME'GUE, or GAGMEGUE, a name of the Mohawk Indians. They called themselves by a word signifying "she-bear." The Algonquins called them Mabaquas, which the French made Moquis, Mohawks, or Mohocks. They were usually at war with the French of Canada; but the Dutch kept them friendly, making a treaty in 1618 that lasted until the old French war, when they did good service for the English in Canada. In the revolution they sided with the British, and under the famous chief Thayendenega, or Brant, did much damage to frontier settlements. Soon after the peace they migrated from their old home in central N. Y. to Canada, where a small remnant still exists. Their language has been elucidated in grammars by Bruyes and Marcoux; and Brant translated the prayer-book and parts of the bible into their tongue.

AGNA'NO, a small lake near Naples, is about 60 ft. in depth, and has no visible outlet. The surrounding country is volcanic and mountainous. Formerly the lake was named *Anguiano*, from the number of snakes in the neighborhood. On the right of lake A. lies the *grotto del cane*—so called from the stratum of carbonic acid gas, some 18 inches deep, which always covers the floor, and which suffocates a dog (*cane*) or other small animal taken into it—and on the left are found the natural vapor-baths of *San Germano*, used for the cure of gout, rheumatism, etc., but inferior in virtue to the baths (*stufi di Nerone*) at Baia. The volcanoes surrounding the lake have been extinct since 1198 A.D. Further on the left from A. lies the lake of *Astroni*, which occupies the crater of an extinct volcano, and is surrounded by beautiful woodlands.

AGNATE (Lat. *agnatus*). Agnates, in the law both of England and Scotland, are persons related through the father, as cognates are persons related through the mother. In the Roman law, both of these terms had a somewhat different signification. Agnates, by that system, were persons related through males only, whilst cognates were all those in whose connection, though on the father's side, one or more female links intervened. Thus, a brother's son was his uncle's A., because the propinquity was wholly by males; a sister's son was his cognate, because a female was interposed in that relationship. With us the intervention of females is immaterial, provided the connection be on the male, or paternal side of the house. The cause of our having thus changed the meaning of terms manifestly borrowed from the Roman law, seems to be that in Rome the distinction between agnates and cognates was founded on an institution which has not been adopted in the Roman sense by any modern nation—that, namely, of the *patria potestas* (q.v.). Roman agnati are defined by Hugo to be all those who either were actually under the same *paterfamilias*, or would have been so had he been alive; and thus it was that, as no one could belong to two different families at the same time, the agnation to the original family was destroyed, and a new agnation created, not only by marriage, but by adoption (q.v.). The foundation of cognation, again, was a legal marriage. All who could trace up their origin to the same marriage were *cognati*; and thus the term *cognatus*, generally speaking, comprehended *agnatus*. But though an agnatus was thus almost always a cognatus, a cognatus was an agnatus only when his relationship by blood was traceable through males. Justinian abolished entirely the distinction between agnates and cognates, and admitted both to legal succession and to the office of tutor of law, not only kinsmen by the father, though a female had been interposed, but even those by the mother (*Nov. 118, c. 4, 5*). As to the legal effects of the distinction in the modern sense, see SUCCESSION, GUARDIAN.

AGNES, SAINT, a Christian virgin, martyred by order of Diocletian, when about 15 years old. The legend is that her beauty excited the son of a prætor, whom she escaped through miraculous blindness that fell upon him; and that his sight was restored in answer to her prayers.

AGNESI, MARIA GÆTANA, a woman remarkable for her varied attainments, was b. at Milan, 1718. In her ninth year she could converse in Latin, and gave a lecture in this language, in which she argued that a knowledge of the ancient languages was a proper accomplishment in women. In her eleventh year she could also speak Greek fluently, and subsequently acquired with great facility several of the oriental languages, and also French, Spanish and German. She was jocosely styled "the walking polyglot." This precocious development of intellect was encouraged by her father, who invited parties of learned men to his house, with whom Maria disputed on philosophical points. Of her discourses in these parties, her father published some specimens entitled *Propositiones Philosophicæ* (Milan, 1738). After her twentieth year she devoted her mind to the study of mathematics, wrote an unpublished treatise on *Conic Sections*, and published her *Istituzioni Analitiche* (2 vols., Milan, 1748). This work so extended her reputation

that when her father was disabled by infirmity she took his place as professor of mathematics in the university of Bologna, by the appointment of pope Benedict XIV. It is said that after her devotion to the study of mathematics her cheerfulness vanished, she avoided society, and at last became a nun, and gave the whole of her time to attendance on the poor and the afflicted. Maria A. was a remarkable exception to the general rule of precocious intellect and short life, as she lived to the age of 81.

**AGNUS DEI** (Lat. "Lamb of God"), one of the titles of Christ (John i. 29); also the name given to a certain prayer used in the Roman Catholic service of mass. The litanies generally conclude with the same prayer: "O Lamb of God, that takest away the sins of the world, have mercy upon us."—The figure of a lamb bearing a cross, stamped upon an oval of wax, silver or gold, is also styled an *A. D.* Such medals have been consecrated by the popes since the 14th c., and are generally distributed among the faithful on the first Sunday after Easter. In the ancient church candidates for baptism received similar medals of wax and wore them as amulets. See **AMULET**. In the Greek church, the cloth which covers the cup in the communion service bears the image of a lamb, and is styled the *A. D.*

**AGNES SOREL**, 1409-50; mistress of Charles VII. of France, and lady of honor to the queen, the virtuous Marie of Anjou, whose full confidence she long enjoyed. She had great influence over Charles, and is credited with rousing him from the lethargy into which he had fallen after the successes of Henry V. of England at Agincourt and elsewhere. Her death was sudden, and it is supposed that she was poisoned by the dauphin, afterwards Louis XI. She had three children by the king.

**AGNI**, or **AGNIS**, the Hindoo god of fire, represented with two faces, three legs, and seven arms. He is of deep red color, and the faces are said to represent fire in its two elements, beneficent and destructive; the seven arms represent the primary colors. He bears incense to heaven, and appears to be a mediator between men and the gods.

**AGNOËTTE**, a sect in the 6th c. which gave prominence to the statement that, in his human nature, Christ was ignorant of many things, especially of the time of the day of judgment. An earlier sect of the same name denied the omniscience of God.

**A'GNOLO**, **BACCIO D'**, b. Florence, 1460; architect of the villa Borgherini, and of the campanile of the church of San Spirito, in that city. He was the first to use frontons, or frontispieces, for windows and doors in private buildings.

**AGNOMEN**, among the Romans, a fourth name derived from some act, quality or event, as "Cunctator" added to Fabius, equivalent to "Fabius the delayer." Pliny "the younger" is also an instance.

**AGNONE**, a t. of S. Italy, in the province of Campobasso, and 22 m. n.w. from the t. of Campobasso. It stands on a hill, and is said to occupy the site of the ancient *Aquilonia*. It is celebrated for its copper works. Pop. 7500.

**AGOBARD**, **SAINT**, 779-840; bishop of Lyons. He was deposed, in 835, for taking part in the rebellion of the sons of Louis *le debonnaire*; but on their reconciliation to their father, A. was restored to his place. He wrote against the worship of images, against witchcraft, dueling, and the Jews.

**AGONIC LINE**, the line of no variation of the magnetic needle. It passes from pole to pole in a curve differing widely from the meridian, as the acclinic line (line of no inclination or dip of the needle) differs from the equator. The A. L. varies in position, constantly traveling westward in unison with the magnetic pole, at a rate that might make a revolution around the earth in about 600 years. In 1590, the line ran through Sweden; in 1630, through Holland; in 1660, England; in 1700, the w. part of Ireland; it reached America in 1780, and now crosses the w. part of Ohio.

**AGONISTICI**, an ascetic sect of Christians in Africa in the 4th c., who believed in neither labor nor marriage. They were mostly low and ignorant, living by beggary, and courting violent death as martyrdom. They disappeared after an invasion of the Vandals.

**AGOSTA**, or **AUGUSTA**, a fortified city of Sicily, in the province of Syracuse, 13 m. n. of that city. It stands on a peninsula projecting into the Mediterranean. It is said to occupy the site of the *Megara Hyblaea* of the ancients, but contains no ancient remains. The present city was founded by the emperor Frederick II. in 1229. It was the last place in Sicily to hold out against Charles of Anjou, but was betrayed into the hands of William L'Estendard, one of his barons, in 1268, when it was sacked, and its inhabitants mercilessly butchered. It remained desolate for years, but having been repopled, and begun again to prosper, it was burned and razed to the ground in 1360 in another Sicilian war; and again was taken and burned by the Turks in 1531. Finally, in 1663, it was destroyed by an earthquake, when one third of the inhabitants perished. It has three long parallel streets. The houses are generally of one story. The port is spacious, but of rather difficult access. Salt is the chief article of export. Oil, wine, cheese, fruit, honey and sardines are also exported. Pop. 9800.

**AGOSTINO** and **A'GNOLO** (or **ANGELO**) **DA SIENA**, brothers, architects and sculptors of Siena, who lived in the latter part of the 13th c. They studied under Pisano, designed the Palazzo de Novi, the church of St. Francesco, and the Porta

Romana; and built the tomb of bishop Guido, after designs by Giotto; a noble piece of work, unfortunately destroyed by the French under the duke of Anjou.

AGOSTINO, PAOLO, 1593-1629; an Italian musician. He studied under Nanini, and was Ugolini's successor as the conductor of the pope's orchestra in St. Peter's. He left many good compositions, of which an Agnus Dei for eight voices was greatly admired.

AGOULT, MARIE CATHERINE SOPHIE DE FLAVIGNY, Countess, 1805-76; a French authoress known by her signature of "Daniel Stern," daughter of vicomte De Flavigny. She was married in 1827; traveled in central Europe; wrote novels, 1841 to 1845, *Herre*, etc., which appeared in *La Presse* of Paris. In 1848, she became a political writer, and published a history of the revolution of that year, in which she favored the cause of the people. She wrote, also, *Three Days in the Life of Mary Stuart*, *Dante and Goethe*, etc. She had a daughter by Franz Liszt, who justified her musical paternity by marrying first Hans Von Bulow, and next Richard Wagner.

AGOUTI (*Dasyprocta agouti*), a small quadruped nearly allied to the cavy or Guinea-pig, very abundant in some parts of the W. Indies and of S. America. It is often very injurious to the fields of sugar-cane. It is gregarious. Its flesh resembles that of the hare or rabbit. Other species are found in the same regions, and even in the colder parts of S. America. The *pampas hure* is *dasyprocta patachonica*.

AGRA, a British district in the lieutenant-governorship of the North-western Provinces, bounded n. and e. by the districts of Muttra, Minpooree and Etawah, s. and w. by the territories of Dhorthpore, Gwalior and Bhurtpore. Its area is 1908 sq.m. The surface of the country is for the most part very level, the principal elevation of the Futtehpoore Sikri hills, a sandstone range on the w. frontier, being about 700 ft. The principal rivers are the Jumna—flowing along the n.e. frontier, and its tributary the Chumbul (along the southern boundary), both of which are too deep in the channel to be of much avail for irrigation. The district generally is, in consequence, deficient in water, and the failure of the rains in some seasons (as in 1837, 1838) has been followed by severe famine. The temperature has a wide range, being, during the hot winds of April, May and June, so high that the city of A. is scarcely habitable by Europeans, while in Jan. severe frosts occur at night, though the thermometer at midday is high. The most important commercial product is cotton, which generally occupies about a tenth of the arable land. There are two crops yearly—the spring crop, consisting of various grains (wheat, barley, oats, etc.), leguminous plants, flax, tobacco, etc., the autumnal crop of maize, *mung*, *moh*, melons, etc. The cultivation of rice is very limited, owing to the want of water. The pop. in '72 was 1,096,367, of whom about 100,000 were Mohammedans, Europeans, etc., the rest Hindoos. Of the Hindoo population, about two thirds are agricultural; of the rest about one fourth.—The "division" of A., which constitutes one of seven in the North-western Provinces, embraces the districts of A., Muttra, Furruckabad, Minpooree, Etawah and Etah, and contains an area of 10,164 sq.m., with a pop. in '72 of 5,040,919. In 1833 it was resolved (3 and 4 Will. IV. cap. 85) to divide the Bengal Presidency into two, one of which was to be called the A. Presidency. This act was never carried into effect, and a subsequent act suspended its operation, substituting the present arrangement. See NORTH-WESTERN PROVINCES. Till 1862, the city of A. was the seat of the lieutenant-governor, from which circumstance that functionary was sometimes called the lieutenant-governor of A.

AGRA, a city in the British n.w. provinces in India, is situated in the district of the same name on the right bank of the Jumna, 139 m. s.e. from Delhi, and 783 n.w. from Calcutta. The ancient walls of the city embrace an area of about 11 sq.m., of which about one half is at present occupied. The houses are for the most part built of the red sandstone of the neighboring hills. The principal street, running n.w. from the fort, is very spacious, but the rest are generally narrow and irregular, though clean. Some of the public buildings, monuments of the house of Timour, are on a scale of striking magnificence. Among these are the fortress built by Akbar, within the walls of which are the palace and audience-hall of Shah Jehan, and the Moti Masjid or Pearl Mosque, so called for its surpassing architectural beauty. Still more celebrated is the Taj Mahal, situated without the city, about a mile to the e. of the fort. This extraordinary and beautiful mausoleum was built by the emperor Shah Jehan for himself and his favorite wife, Arjmand Banoo (surnamed Mumtaz Mahal). 20,000 men, says Tavernier, who saw the work in progress, were employed incessantly on it for 22 years. The principal parts of the building are constructed or overlaid outside and in with white marble; and the mosaic work of the sepulchral apartment and dome is described by various travelers in terms of glowing admiration. It is composed of twelve kinds of stones, of which lapis-lazuli is the most frequent, as well as the most valuable. Of British edifices in and near the city, the principal are the government house, the college (for the education of natives), the Metcalfe testimonial, the English church and the barracks. The climate at A., during the hot and rainy seasons (April to September), is very injurious to Europeans; but on the whole, the average health of the city is equal to that of any other station in the n.w. provinces. A. is fortified and has a garrison; there is a military station in the neighborhood of the city. As administrative center of its district, and of the large "division" to which it gives name, A. is a place of great importance. The pop.,

according to the census of 1872, is 149,008. The principal articles of trade are cotton and salt, which are conveyed in large quantities down the Jumna to the lower provinces. This city is held in great veneration by the Hindoos, as the scene of the incarnation of Vishnu under the name of Parasu Rama. It first rose to importance in the beginning of the 16th c., and from 1526 to 1658, it was the capital of the Mogul sovereigns. In that year, Aurangzebe removed to Delhi; henceforth A. declined. It was taken in 1784 by Scindia, and surrendered in 1803 to lord Lake, after a bombardment of a few hours. Among the spoils on that occasion was a cannon of 23 in. calibre, 11½ in. metal at the muzzle; length, 14 ft. 2 in.; weight, 96,000 lbs. The balls, of cast-iron, weighed 1500 lbs. This stupendous piece of ordnance is said to have been wantonly reduced to fragments by blasting by some artillery officers in 1833 (*Thornton's Gazetteer of India*). During the late mutiny, A. was one of the places in which the Europeans were shut up. At the outbreak the garrison consisted of the 44th and 67th regiments of B. N. infantry, the 3d European fusiliers and a few artillery. The native regiments were disarmed in June, 1857, and the defense of this important city devolved upon the Europeans. The ladies resorted at night to places of refuge appointed by the governor, while the gentlemen patrolled the streets; but matters growing worse both in the city and country, it was resolved, after a battle with the mutineers, to abandon the city and retire to the fort or residency. It was time; for some thousands of prisoners getting loose, began to fire all the European buildings in the city. Hardly a house escaped destruction; numbers of traders were ruined, and had to endure the misery of beholding their ruin from the fort. As the fort was both large and strongly defended, fugitives flocked in from all parts of the country, and the numbers soon swelled to 5846. Heroic sallies were occasionally made. Major Montgomery's march to Allypore, and his defeat of the rebels, though twenty times as numerous, was a feat worthy of Havelock. When Delhi fell, its rabble of defenders hurried off in the direction of A., which place was seriously threatened by them, but was relieved by the rapid and brilliant march of col. Greathed, who discomfited the enemy, and despoiled them of nearly all their baggage.

**AGRAM**, the capital of Croatia, finely situated at the foot of a richly wooded range of mountains, is about 2 m. from the Save, in lat. 45° 49' n., long. 16° 4' e. King Bela IV. raised it in 1266 to the dignity of the royal town, in consequence of its having assisted him against the Tartars. The town is divided by a small stream into three parts, each of which is under a separate jurisdiction. These are—the royal town proper, or upper town, built upon two eminences; the capital, or lower town; and the episcopal town, under the jurisdiction of the bishop. The inhabitants are principally Croats, who carry on a trade in wood, corn and tobacco, and manufacture porcelain and silk. The lower town is the newest and finest in appearance, many of the houses having Italian roofs. A. is the residence of the governor of Croatia, and of a Catholic bishop; and it is the place of meeting of the provincial diet. It possesses a university (since 1874) and a public library. Pop., '69, 19,857.

**AGRA'RIAN LAW.** With the name of A. L. used to be associated the idea of the abolition of property in land, or at least of a new distribution of it. This notion of the A. laws of the Romans was not only the popular one, but was also received by most scholars. The French convention, in 1793, passed a law punishing with death any one who should propose an A. L., understanding by the term an equal division of the soil among all citizens. Now, it would have been strange if the Romans, with whom private property was so sacred, could ever have been brought to sanction any measure of the kind. It was the German scholars, Heyne, Savigny, and especially Niebuhr, who first explained the true nature and character of the Roman A. laws. There are still some disputed points on this matter, but one thing seems made out—that those laws had no reference to private lands held in absolute property, but to public or state lands.

As the dominion of Rome extended, a portion more or less of each conquered territory was confiscated to the state, and became public domain. All laws respecting the disposition of these lands were called A. laws; which are therefore of various kinds. What made these laws be so long mistaken for an interference with private rights, and excited such opposition to them at the time, was the use which was made of the public domains while unappropriated. "It was the practice at Rome," says Dr. Arnold, "and doubtless in other states of Italy, to allow individuals to occupy such lands, and to enjoy all the benefits of them, on condition of paying to the state the tithe of the produce, as an acknowledgment that the state was the proprietor of the land, and the individual merely the occupier. Now, although the land was undoubtedly the property of the state, and although the occupiers of it were in relation to the state mere tenants-at-will, yet it is in human nature that a long undisturbed possession should give a feeling of ownership; the more so as, while the state's claim lay dormant, the possessor was, in fact, proprietor, and the land would thus be repeatedly passing by regular sale from one occupier to another."

The state, however, was often obliged to interfere with these occupiers of the public lands, and resume its rights. The very idea of a citizen, in ancient times, involved that of a landholder, and when new citizens were to be admitted, they had each to receive their portion out of the unallotted public domain; which was attended, of course, with the ejection of the tenants-at-will. It appears, also, that the right to enjoy the public

lands in this temporary way was confined to the old burghers or patricians. This, taken in conjunction with the tendency, strong at all times, of larger possessions to swallow up smaller, kept up an ever-increasing number of landless commons, whose destitution and degradation came from time to time to such a pitch that alleviation was necessary to prevent the very dissolution of the state. It is easy, however, to see what motive the patricians, as a body, had to oppose all such measures, since it was their interest, though not their right, to keep the lands unallotted.

The enactment of A. laws occasioned some of the most memorable struggles in the internal history of Rome. Most of the kings of Rome are said to have carried an A. L., that is, to have divided a portion of the public land among those whom they admitted to the rights of citizenship. "The good king," Servius Tullius, may be looked upon as the first victim of the hostility of the nobles to A. laws. About twenty-four years after the expulsion of the Tarquins, the distress of the commons called aloud for remedy, and the consul, Spurius Cassius, proposed an A. L. for a division of a certain proportion of the public land, and for enforcing the regular payment of the rent or tithe from the occupiers of the remainder. The aristocracy, however, contrived to defeat the proposal, and when the year of his consulship was out, Cassius was accused of trying to make himself king, was condemned, scourged and beheaded, and his house razed to the ground.

The first important A. L. of a permanent nature, actually passed, was that proposed by the tribune, Licinius Stolo, and carried, after a struggle of five years, in the year of Rome 383. The provisions of Licinius's bill, or *rogation*, were as follows: "Every Roman citizen shall be entitled to occupy any portion of the unallotted state land not exceeding 500 *jugera* (see ACRE), and to feed on the public pasture-land any number of cattle not exceeding 100 head of large, or 500 head of small, paying in both cases the usual rates to the public treasury. Whatever portions of the public land beyond 500 *jugera* are at present occupied by individuals shall be taken from them, and distributed among the poorer citizens as absolute property, at the rate of seven *jugera* apiece. Occupiers of public land shall also be bound to employ a certain number of freemen as laborers."

This law produced for a time very salutary effects. But before the year 631, when Tiberius Gracchus was elected tribune, the Licinian law had been suffered to fall into abeyance; and although vast tracts had been acquired by the Italian, the Punic and the Greek wars, no regular distribution of land among the destitute citizens had taken place for upwards of a century. Numerous military colonies had indeed been founded in the conquered districts, and in this way many of the poorer Romans or their allies had been provided for; but still there remained large territories, the property of the state, which, instead of being divided among the poorer members of the state, were entered upon and brought into cultivation by the rich capitalists, many of whom thus came to hold thousands of *jugera*, instead of the five hundred allowed by the Licinian law. To a Roman statesman, therefore, looking on the one hand to the wretched pauper population of the meaner streets of Rome, and on the other to the enormous tracts of the public land throughout Italy which the wealthy citizens held in addition to their own private property, the question which would naturally present itself was—Why should not the state, as landlord, resume from these wealthy capitalists, who are her tenants, as much of the public land as may be necessary to provide little farms for these pauper citizens, and so convert them into respectable and independent agriculturists? This question must have presented itself to many; but there were immense difficulties in the way. Not only had long possession of the state lands, and the expenditure of large sums in bringing them into cultivation, given the wealthy tenants a sort of proprietary claim upon them, but in the course of generations, during which estates had been bought, sold and inherited, the state lands had become so confused with private property that in many cases it was impossible to distinguish between the two. Notwithstanding these difficulties, Tiberius Gracchus had the boldness to propose an A. L., to the effect that every father of a family might occupy 500 *jugera* of the state land for himself, and 250 *jugera* additional for each of his sons; but that, in every case where this amount was exceeded, the state should resume the surplus, paying the tenant a price for the buildings, etc., which he had been at the expense of erecting on the lands thus lost to him. The recovered lands were then to be distributed among the poor citizens; a clause being inserted in the bill to prevent these citizens from selling the lands thus allotted to them, as many of them would have been apt to do.

According to the laws and constitution of Rome, there was nothing essentially unjust in this proposal, which was, in private, at least, approved of by some of the most distinguished men of the time. The energy of Gracchus carried the measure, in spite of the opposition of the aristocratic party, whose vengeance, however, could only be satisfied with the assassination of Gracchus and his brother. See GRACCHUS. The attempts to carry out the "Sempronian law," as it was called, were attended with great difficulties, and although not formally repealed, it continued to be evaded and rendered inoperative. Various A. laws were subsequently passed, some by the victorious aristocratic party, in a spirit directly opposed to the Licinian and Sempronian laws.

Besides A. laws having for their object the division among the commons of public lands usurped by the nobles, there were others of a more partial and local nature, for the establishment of colonies in particular conquered districts: these naturally met with

less opposition. Still more different were those violent appropriations of territory made by the victorious military leaders in the latter times of the republic, in order to reward their soldiers, and establish exclusively military colonies. In these the private rights of the previous occupants were often disregarded.

AGREDA, MARIA DE (CORONEL), 1602-65; the superior of the convent of the Immaculate Conception in Agreda, Spain. She reported that she had had revelations from heaven, and that God had commanded her to write an inspired life of Mary, the mother of Jesus. Such a book was published; but the church authority forbade the reading of it, and Bossuet pointed out some of its indecent portions.

AGRICOLA, CHRISTOPH LUDWIG, 1667-1719; a landscape painter, who traveled in England, Holland, and France, and lived some time in Naples. His works are noted for skillful representation of varied phases of climate. In light and color he imitated Claude Lorraine.

AGRICOLA (originally LANDMANN), GEORG, 1494-1555; mineralogist, and the first to raise the study into a science. He studied at Leipsic and in Italy. In Bohemia he practiced as a physician, and, in 1531, was made professor of chemistry in a mining district of Saxony, where he pursued his favorite study. He published *De Re Metallica*, which gives minute descriptions of mining processes.

AGRICOLA, CNEZUS or CNEIUS JULIUS, a Roman of the imperial times distinguished not less by his great abilities as a statesman and a soldier than by the beauty of his private character, was born at Forum Julii (now Fréjus in Provence), 37 A.D. Having served with distinction in Britain, Asia, and Aquitania, and gone through the round of civil offices, he was, in 77 A.D., elected consul, and in the following year proceeded as governor to Britain—the scene of his military and civil administration during the next seven years. He was the first Roman general who effectually subdued the island, and the only one who displayed as much genius and success in training the inhabitants to the amenities of civilization as in breaking their rude force in war. In his seventh and last campaign (84 A.D.), his decisive victory over the Caledonians under Galgacus, at a place called *Mons Graupius*, established the Roman dominion in Britain to some distance n. of the Forth. After this campaign, his fleet circumnavigated the coast, for the first time, discovering Britain to be an island. Among the works executed by A. during his administration were a chain of forts between the Solway and the Tyne, and another between the Clyde and Forth. Numerous traces of his operations are still to be found in Anglesey and N. Wales, and in Galloway, Fife, Perthshire and Angus. The news of A.'s successes inflamed the jealousy of Domitian, and he was speedily recalled. Thenceforth he lived in retirement; and when the vacant proconsulships of Asia and Africa lay within his choice, he prudently declined promotion. The jealousy of the emperor, however, is supposed to have hastened his death, which took place at the early age of 55. His life, by his son-in-law, Tacitus, has always been regarded as one of the choicest specimens of biography in literature.

AGRICOLA, JOHANN FRIEDERICH, 1720-74; a musical composer who studied under Bach. He was a superior organist, and held the office of kapellmeister under Frederic II. He wrote "Achilles" and other operas, and minor compositions.

AGRICOLA, JOHN (whose true name was Schnitter or Schneider, but who was also called Magister Islebius and John Eisleben, after the name of his native town), b. 1492, was one of the most zealous founders of Protestantism. Having studied at Wittenberg and Leipsic, he was sent, 1525, by Luther, who highly appreciated his talents and learning, to Frankfort-on-the-Main, to institute there, at the desire of the magistrates, the Protestant worship. On his return, he resided as a teacher and preacher in his native town of Eisleben, till 1536. In 1537, he became a professor at Wittenberg, where the Antinomian controversy, already begun between him and Luther and Melancthon, broke out openly. See ANTINOMIANISM. The troubles in which he was thus involved obliged him to withdraw, 1538, to Berlin, where he was reduced to extreme want, and was thus induced to make a recantation, never altogether sincere. He then found a protector in the elector John of Brandenburg, who appointed him preacher to the court and general superintendent. He made great exertions for the spread of the Protestant doctrine in the Brandenburg states; but ere his death, which took place at Berlin, 22d Sept., 1566, he had become as much hated for his share in the drawing up of the Augsburg *Interim* (q.v.), as he had formerly been for his Antinomian opinions. Besides his numerous theological writings, his country possesses a truly national work of his, entitled *Die Gemeinen Deutschen Sprüchwörter mit ihrer auslegung* (common German proverbs, with their explanation; Hagenau, 1592; and a very complete but somewhat altered edition at Wittenberg, 1592). The patriotic feelings, pure morals and pithy language of this book have procured for it one of the first places among the German works of that age.

AGRICOLA, MICHAEL, a Swedish scholar and reformer, who, in the latter part of the 16th c., translated the New Testament into the Finnish language.

AGRICOLA, RUDOLPHUS, one of the most learned and remarkable men of the 15th c., and a chief instrument in transplanting the taste for literature, just revived in Italy, into his native country of Germany, was born 1443, in the village of Bafo, near Gröningen. His name was properly Rolet Huysmann (i.e., houseman or husbandman), which was

Latinized by him into A., after the usage of the time. He was also called Frisius, and Rudolf of Gröningen, from his native place; and sometimes Rudolf of Ziloha, from the monastery of Silo, where he spent some time. Having been first a disciple of Thomas à Kempis at Zwole, he went to Louvain, then to Paris, and thence to Italy, where, during the years 1476 and 1477, he attended the lectures of the most celebrated men of his age. Here he entered into a close friendship with Dalberg, who afterwards became bishop of Worms. He was the first German who distinguished himself in Italy in public speaking and lecturing, and this he did not only by his erudition, but by the elegance of his language and the correctness of his pronunciation. He likewise acquired reputation as an accomplished musician, and his pieces were popular throughout Italy. On his return to Germany, he endeavored, in connection with several of his former co-disciples and friends, among whom were Alexander Hegius and Rudolphus Lange, to promote a taste for literature and eloquence in Germany. Several cities of Holland vainly strove with each other to obtain his presence, by offering him public functions; but not even the brilliant overtures made to him by the court of the emperor Maximilian I., to which he had repaired in connection with affairs of the town of Gröningen, could induce him to renounce his independence. At length yielding, 1482, to the solicitations of Dalberg, who was now chancellor to the elector palatine, and bishop of Worms, he established himself in the palatinate, where he sojourned alternately at Heidelberg and Worms, dividing his time between private studies and public lectures, and enjoying high popularity. He distinguished himself also as a painter; and at the age of 40 set with ardor to learn Hebrew, in order to study theology. He went again, 1484, with Dalberg into Italy, and died shortly after his return to Germany, on the 25th Oct., 1485. His fame rests chiefly on the personal influence he exerted. His compositions, which are written in Latin, are neither so numerous nor so important as those of many of his learned contemporaries. The first nearly complete edition of them was that published by Alard (2 vols., Cologne, 1539). Consult Tresling, *Vita et Merita*, R. A. (Gröningen, 1880).

**AGRICULTURAL CHEMISTRY**, that branch of chemical science which treats of the composition of soils and manures, and of the vegetable and animal substances which it is the object of agriculture to produce. Instead of considering the subject by itself, it will receive attention under the heads of Drainage, Irrigation, Manures, Soils, etc.

**AGRICULTURAL EDUCATION**, as at present understood, is a comprehensive term, including instruction in chemistry, geology, botany, zoology, mechanics—embracing, in short, the *science* as well as the *practice* of agriculture. However important the branching off of education into this special track, it is only of late years that adequate attention has been paid to it. The first agricultural school was founded by Fellenberg at Hofwyl, in Switzerland, in 1806. His pupils were taken from the poorest class of peasantry, of whom he truly observed, that having "no other property than their physical and mental faculties, they should be taught how to use this capital to the best advantage," by a combination of "discipline, study, and manual labor." No fewer than 3000 pupils were trained in this school, which flourished for thirty years under the able direction of Wehrli. Since then, various institutions of the same character have sprung up on the continent. In France, several have been supported by the state—the principal being the one at Grignon, to which an old royal palace with its domain of 1185 acres has been given up. One of the first duties undertaken by the new government of marshal MagMahon, in 1873, was the nomination of a commission to reorganize the system of agricultural education. In Prussia, there is scarcely a province that does not boast its agricultural school and model farm; and, indeed, throughout Germany, as well as in Russia, we find educational institutions supported by the state, in all of which, with some slight difference of detail, agriculture is practically as well as theoretically taught. More recently, experimental stations have been established in various parts of the empire. Indeed the agricultural schools and field experimental stations in Germany are a credit to that country and a source of much attraction to visitors from other countries.

In America, increasing facilities are being provided for acquiring a thorough knowledge of agriculture scientifically as well as practically. Several of the British colonies have recently established boards of agriculture and agricultural schools. The government of Ontario started an agricultural college and model or experimental farm at Guelph, in May, 1874. It has so far been very successful. An efficient staff of lecturers has been secured, and instructions are systematically given to first-year's students in agriculture, chemistry, zoology, anatomy, physiology and book-keeping; while second-year's students are taught entomology, meteorology and cattle pathology. High-bred stock of various kinds imported from the mother-country are kept on the college farm.

In England, there are as yet no state institutions of this kind. In 1845, an agricultural college was established, by private enterprise, at Cirencester, for the education of both resident and non-resident pupils, the course of instruction extending over two years. A large farm is attached to the school. A strong feeling was manifested throughout Britain between 1873 and 1877 in favor of more attention and encouragement being extended to agricultural education, especially by the state. British agriculturists at length came to see that as farming had got to be a science in itself, their educational system was lamentably defective. In the practical training, the young British farmer

has long been and possibly still is ahead of his fellows in other countries; but it has recently become notorious that so far as an acquaintance with the various sciences that bear on agriculture is concerned, British agriculturists are considerably behind some of their neighbors—Germany, for example. Besides publishing twice a year a very instructive and useful *Journal*, the royal English agricultural society has since 1868 given handsome prizes as well as the certificate of the society to young men, at the close of an annual examination, who are supposed to have finished their agricultural and scientific education. Those who obtain first-class certificates are enrolled as life members of the society. After conference with the head-masters of the middle-class schools of England, this society commenced in 1874 to offer ten annual scholarships of £20 each to scholars from the middle-class schools who pass the best examinations in land surveying, the mechanics of agriculture, the chemistry of agriculture, the principles of agriculture, the nutrition of animals and plants, etc. The successful candidates must study for the year at an agricultural college, or with an approved practical agriculturist. This scheme works very successfully. Through the liberality of the duke of Bedford, the royal English agricultural society was enabled to establish an experimental farm on his grace's property at Woburn, Bedfordshire, in 1873. On this farm, experiments in the fattening of stock with various kinds of food, and in the growing of crops with different kinds of manures, are carried on.

In addition to offering diplomas, life memberships and certificates to agricultural students who successfully pass an examination similar to the above, the highland and agricultural society resolved in 1874 to give ten scholarships of £20 each, tenable for one year, to students attending the agricultural department of Edinburgh university (the only British university that possesses a chair of agriculture), and five scholarships of £10 each to younger students, who may the second year compete for the £20 scholarships. The society otherwise contributes handsomely to the agricultural department of Edinburgh university. This society was also instrumental in 1875-6 in getting the government to add agriculture to the list of subjects towards instruction in the sciences of which aid is given by the science and art department. Classes were early set on foot at Aberdeen with the view of enabling teachers of country schools to qualify for giving instruction in the elementary sciences relating to agriculture. Field experiments were begun in Aberdeenshire in 1876 through the enterprise of the leading agriculturists and the liberality of several landowners and others who subscribed handsomely to the necessary funds. The highland and agricultural society resolved also in that year to start two experimental agricultural stations in the Lothians. Many farmers, both in England and Scotland, especially the latter, keep agricultural students.

The authorities in Ireland were many years ago alive to the benefits of a scientific education for farmers. The commissioners of national education have not been idle. In 1838 they established that popular, useful and well-conducted institution, Glasnevin training college, which has 180 acres of land attached. Some of the students coming from minor schools and passing an entrance examination are admitted free, and get two years' training; others pay for the bare cost of their board and lodgings; while a third class consists of young men who board at their own expense in the neighborhood, and pay a moderate fee for attendance at the classes. Lectures are regularly delivered on animal and vegetable physiology, chemistry, geology, botany and practical agriculture, while instructions in the field are carefully attended to. Much good has been done in Ireland by the attachment of small farms or gardens to about 200 national schools throughout the country, where elementary instructions in agriculture and the sciences bearing thereon are given, with excellent results. Many of the pupils pass from these schools to Glasnevin college, while the teachers of the national schools often qualify for their agricultural duties by attendance at this college and model farm. Lately, however, some of the farm schools have been discontinued by the government.

**AGRICULTURAL EDUCATION** (*ante*). In the United States the West Point academy, established in 1802, was the first provision by the general government for scientific education in any department; the naval academy followed in 1845. Two years later, John P. Norton, agricultural chemist, just returned from Europe, agitated the question of agricultural schools, and one school was begun. In 1860, it was liberally endowed by Joseph E. Sheffield, and is now attached to Yale college as the "Sheffield scientific school." In 1852, a legacy to Dartmouth college, by Abiel Chandler, laid the foundation of a similar branch at that college. Congress was repeatedly asked to set apart lands for the support of agricultural colleges, and a bill was passed in 1858 for that purpose, but the president failed to sign it. In 1862, the effort was successful, and a bill became a law appropriating about ten millions of acres to all the states, to be divided according to the number of representatives from each state in congress. Meantime, New York and other states kept the question alive, and Michigan opened her agricultural college in 1857; and now, under one or another name, nearly all the states have colleges or parts of colleges in which scientific agriculture is taught. On the 2d of July, 1862, congress passed an act donating public lands to the several states and territories which may provide colleges for the benefit of agriculture and the mechanical arts, the amount of land to be equal to 30,000 acres for each senator and representative in congress to which the states were then entitled. To guard against the loss of this

fund by improvident investment, the act provides that all moneys derived from the land granted shall be invested in stocks of the United States or of the state, or some other safe stock yielding not less than five per cent.; and that if any portion of the fund or the interest thereon shall be lost or diminished, it shall be replaced by the state, so that the capital shall forever remain undiminished, except that a sum not exceeding ten per cent. on the amount received by any state under the act may be applied to the purchase of lands for sites or experimental farms, whenever authorized by the legislature. The general object and character of the colleges to be established is briefly stated in the fourth section of the act, which provides that the interest of the fund shall be inviolably appropriated by each state which may claim the benefit of the act, "to the endowment, support, and maintenance of at least one college, where the leading object shall be (without excluding other scientific and classical studies, and including military tactics) to teach such branches of learning as are related to agriculture and the mechanic arts, in such manner as the legislatures of the states may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." The states were not slow to avail themselves of these advantages, and the important interest of A. E. suddenly sprang into life. The last report on this subject at hand shows that in 33 states there were, 1876, 39 colleges which have received the congressional land grant of July 2, 1862. There were also branch institutions in Georgia and Missouri. The agricultural and mechanical college of Texas was opened during the year. All the colleges were in operation except that of Florida, which was expected to open early in 1877. In all these colleges the professors and assistants numbered 473, and the students 4211. Eleven states had not sold all the land scrip granted by congress. During the year 51,405 acres were sold at an average price of \$4.41 per acre, and 1,463,505 acres remained unsold. The largest average price per acre obtained by any one state was \$8.38 by Michigan, and the smallest \$2.20 by Iowa. The annual interest received by all the colleges for all the land sold amounted during the year to \$525,735. Thirty-four of the colleges had farms, which contained in the aggregate 15,418 acres, valued at \$1,321,092. The following table gives the names of the agricultural and industrial colleges and departments established in the United States up to 1877, with the number of students pursuing agricultural or mechanical branches:

## INDUSTRIAL INSTITUTIONS IN THE UNITED STATES.

WHICH HAVE RECEIVED THE NATIONAL ENDOWMENT OF LAND SCRIP UNDER THE ACT OF JULY 2, 1862.

LOCATION.	NAME OF INSTITUTION.	PRESIDENT.	Professors.	Students.
Auburn, Ala.	Agricultural and mechanical college of Ala.	I. T. Tichenor, D.D.	10	279
Fayetteville, Ark.	Arkansas industrial university.	Gen. D. H. Hill.	13	173
Berkeley, Cal.	Univ. of Cal.—colleges of agricul. and mech.	John Le Conte, M.D.	19	50
New Haven, Ct.	Yale college—Sheffield scientific school.	N. Porter, D.D., LL.D.	26	197
Newark, Del.	Delaware college.	W. H. Furnell, LL.D.	8	43
Eau Gallie, Fla.	Florida state agricultural college.	Wm. W. Hicks.	..	..
Athens, Ga.	Univ. of Ga., Ga. state coll. of agr. and mech.	Hy. H. Tucker, LL.D.	11	61
Dahlgonega, Ga.	Univ. of Ga., North Georgia agricul. coll.	..	6	320
Urbana, Ill.	Illinois industrial university	S. H. Peabody, PH. D.	26	416
Lafayette, Ind.	Purdue university—Indiana agricul. college.	Em. E. White, LL.D.	9	196
Ames, Iowa	Iowa state agricultural college.	A. S. Welch, LL.D.	21	245
Manhattan, Kan.	Kansas state agricultural college.	M. L. Wazel.	16	208
Lexington, Ky.	Kentucky univ.—agricul. and mech. college.	J. K. Patterson, PH.D.	7	118
Baton Rouge, La.	Louisiana state agricul. and mech. college.	Col. D. F. Boyd.	8	188
Orono, Me.	Maine state coll. of agricul. and mech. arts.	M. C. Fernald.	7	102
College Stat'n, Md.	Maryland agricultural college.	Wm. H. Parker.	8	81
Boston, Mass.	Massachusetts institute of technology.	Wm. B. Rogers, LL.D.	59	264
Amherst, Mass.	Massachusetts agricultural college.	Levi Stockbridge.	11	162

The whole number of students pursuing agricultural or mechanical studies in the

above institutions was 3354; the number of professors and assistants, including all the departments for the collegiate year, was 516; the whole number of students in all departments was 6723; the number of acres of land-scrip yet unsold, 1,463,505; annual income derived from government endowment, \$536,283; acres contained in the agricultural and mechanical college farms, 11,338; value of these farms, \$1,295,192.

**AGRICULTURAL MACHINERY** has within half a century risen from nearly nothing to the most important adjunct to the farmer, particularly since the application of steam. Taking cultivation in the order of time, we have hoes, spades, plows, and grubbers, in great variety of style and use; surface, subsoil and double-furrow plows. Then come seed-sowers and cultivators, in great variety; rakes, rollers, pulverizers and harrows; breast-plows, or turf-spades; trenching forks; many kinds of drills for sowing and planting seeds; manure spreaders, horse-hoes, turnip-thinners, etc. For harvesting, we have mowing, reaping and binding machines, shellers, fruit-pickers, etc.; hay-makers, horse-rakes, and greatly improved farm vehicles. After the crops are in, we have threshing and winnowing machines; straw cutters; cake (linseed) crushers; corn bruisers; grinding mills; apple grinders in cider presses; weighing machines, and a steaming apparatus for cattle food; and in the dairy, dog-power and other machine churns and hydraulic presses. A. M. is mentioned by Pliny (23 A.D.), who describes a cart used in Gaul with projections in front which cut or tore off the heads of grain, an affair probably something like the modern clover-header. Many efforts were made to build reaping machines in the early part of this century, but little useful was achieved until the time of Bell, Hussey and McCormick. These inventors began 40 to 50 years ago, and now their machines are in use all over the world.

**AGRICULTURAL SOCIETIES**, associations for the purpose of promoting the science and practice of agriculture. Such societies were established in the n. of Italy in the beginning of the last century. As early as 1723 a "society of improvers in the knowledge of agriculture in Scotland" was instituted. This had a short existence; but the necessity of such an association was felt, and another arose in 1755. This also did not succeed well; however, in 1783 a number of gentlemen met in Edinburgh and founded one destined for permanency, the well-known "highland society." The first annual meeting of this body was held in 1784, and it was incorporated by royal charter in 1787. Originally designed for the improvement of the highlands, it extended its operations over the whole of Scotland, and confined its efforts more to the advancement of agriculture. Its title is now, under a royal charter granted in 1834, the "highland and agricultural society of Scotland." Its earliest efforts were aided by a grant of £3000 out of the moneys paid for the estates of the noblemen and gentlemen who were attainted in consequence of their accession to the rebellion of 1745. The funds required to defray the expense of the charter, however, were raised by subscription, and the members then were only about 150. In 1799 the society began to publish its transactions or prize essays. At present its members number 4500. The ordinary subscription is £1 3s. 6d. annually, which may be redeemed by one payment of £12 12s. Tenant-farmers are admitted on a subscription of 10s. annually, or £5 5s. for life. The more important objects aimed at by the society are—

1. Agricultural meetings and general shows of stock, implements and dairy produce held in the principal towns of Scotland.
2. Encouraging a system of district shows, for the improvement of breeds of stock most suitable to the different parts of the country.
3. The encouragement and promotion of a proper system of agricultural and forestry education, by means of powers conferred by a supplementary royal charter in 1856, authorizing "the council of the highland and A. society on education" to prescribe a curriculum of study, and to grant diplomas and certificates to students of agriculture who shall pass the requisite examination.
4. The advancement of the veterinary art, by conferring the society's certificate on students who have passed through a regulated curriculum in the Edinburgh veterinary college, and who are found by a rigid examination qualified to practice.
5. The appointment of two chemists for the purpose of analyzing soils, manures, etc. to members, and for promoting the application of science to agriculture.
6. The establishment of an agricultural museum, illustrative of the vegetable products of the country; but this collection has been handed over to the Edinburgh museum of science and art.
7. The annual publication of reports and prize essays on all branches of agriculture and arboriculture, as well as the proceedings of the laboratory.

The general shows of stock, etc., are held once every year, at Edinburgh, Glasgow, Aberdeen, or some other principal town, and are attended by vast numbers of persons. The business of the society is conducted by a secretary at an office in Edinburgh.

The writings of Arthur Young directed attention to the agricultural condition of England, shortly after the middle of the last century. In 1793 the "board of agriculture" was incorporated. This was a private association, but being supported by parliamentary grants, it so far partook of the nature of a public institution. Its "surveys" of the different counties collected and diffused an immense amount of information of the most

valuable kind. It latterly encouraged experiments and improvements of all kinds in agriculture, but was dissolved in 1816. Various societies have sprung up since then in different parts of England; of these, the "Smithfield cattle club," "the Bath and west of England society," and the "Yorkshire A. society," may be mentioned as the most influential. The growth and vigor of the national society, "the royal A. society of England," has been beyond all precedent. It was established in May, 1838, and then consisted of 436 members, but in 1873 the members were as many in number as 6000. The objects which it pursues are almost identical with those of the highland and A. society of Scotland. Ordinary members pay £1 annually, or £10 for life. The *Journal*, containing interesting and original reports on A. subjects, is sent free to all the members. Ireland also boasts of its "royal A. society of Ireland." It was formed in 1841, and has greatly assisted in advancing the agriculture of the country, especially by introducing improved breeds of cattle.—Most of the countries of continental Europe have followed the example of Gt. Britain in the formation of A. associations of various kinds.

In the free states of America, where the land is mostly owned by those who farm it, A. S. have sprung up in great numbers. Every state has its central society, which in its turn fosters a number of local associations. Indeed, in all the chief grain-producing districts, each co. boasts of its own society. These being all partly supported by state money, useful information is collected, published, and sold at a cheap rate in reports. Canada follows in the wake of her enterprising neighbors, and supports by grants of money a provincial show in each province, while the co. societies are numerous, and supply materials for the reports of the boards of agriculture at Toronto and Montreal. In Canada and the U. S. the A. S. are of a highly popular character. Prizes are given, not only for animals, implements and dairy produce, but also for fruits. Being more of a general nature, combining agriculture, horticulture and domestic economy, such exhibitions are frequented by all classes. They are usually denominated "fairs," though partaking little of the character and appearance of what is understood by a "fair" in Britain. The diffusion of education among the farmers of the free states has made them eager readers of A. writings, and the numerous societies soon diffuse a knowledge of improved stock, implements and seeds over their wide territories.

• **AGRICULTURE** (Lat. *ager*, a field, and *colo*, I till) is the art of rearing those plants and animals that are best suited to supply the wants of man. Man has found the earth, in almost every clime, covered with vegetation, yet this often yields little that he can use. The spontaneous growth of nature affording but a limited quantity of food, he at first attempts to supply the deficiency by capturing the wild animals, which often feed upon what is unsuited for his sustenance. Sometimes, however, the most fertile lands under luxuriant forests, or other natural vegetation, only support a small number of animals. In the most favorable circumstances, a given area of territory cannot maintain many of the human family, so long as they depend upon the natural vegetation or on the chase. It is only after those plants which yield man an abundant supply of food are selected and made the object of cultivation, that population augments, and civilization takes its rise.

Man has selected a great variety of plants for cultivation to afford him food and clothing. In n. lat., wheat, barley, oats, rye and the potato form the chief plants from which he derives subsistence. These crops are most productive when grown in summer in the temperate climates of the earth, being unsuited to the heats of the torrid zone. Their geographical limits, however, are greatly extended by growing them as winter crops on the borders of, and even within the tropics. In these regions, however, rice, maize, millet, and other grains become far more productive of food than the already mentioned cereals are in high latitudes, as they flourish during the heats of summer. Where heat and moisture are almost perennial in the tropics, the banana, the bread-fruit tree, and other herbaceous plants and trees, are most productive of human food. A short historical outline of the A. of different parts of the world will exhibit the chief elements that regulate the practices of the husbandman.

The early civilization of *Egypt* claims for it the first notice in a passing outline of the chief systems of A. The teeming population that existed in ancient times in the narrow valley of the Nile, the large standing army which was maintained, the extraordinary works of engineering and architecture still visible in our day, and the exportation of corn to other nations, indicate an advanced state of the art of A. Rain is a rare phenomenon in upper Egypt, and fertility is only maintained by the waters of the Nile, which are subject to annual floods. The risings and ebbings are as regular now as they were in the days of Herodotus; and the agricultural systems are also in a great measure the same. The inundation which, unless prevented by embankments, covers the whole land, occurs at the hottest season. As the waters retire in October, the land is sown with what are there styled *winter crops*, consisting of wheat, barley, lentils, beans, flax, lupines, chick-pease, etc. All these crops require no further watering, as the moisture which the soil has imbibed during the inundation is sufficient to bring them to maturity about the end of April, or even a month sooner in upper Egypt. Only one crop in the year is grown upon most of the inundated lands. But on those lands which are protected from the inundation, *three crops a year* may be raised by means of artificial watering. Few of the plants used as winter crops can be grown in summer in Egypt. The plants adapted

for summer consist of rice (largely grown in the Delta), durra, millet, maize, sesame, melons, onions; they are sown from April to August, and of several of them two crops in the season ripen under the cloudless sky of Egypt. A vast amount of manual labor and animal power is expended in watering the ground for the summer crops. The peasants use the *shadoof* for the purpose, which is a simple contrivance, used in drawing water over a large portion of the east. The Persian wheel, driven by oxen, is largely employed: so much so, that about 50,000 of these machines are at present in use in the valley of the Nile. Besides these crops, cotton, indigo and sugar-cane are now cultivated to a small extent. When the waters rest long on the land, it answers all the ends of a fallow, by extirpating the land-weeds and disintegrating the soil. The ground, in such cases, requires no further culture than treading in the seed by animals, or slightly scratching the surface with bushes. On the other hand, the summer crops require a great deal of tending, both in cultivating and watering the soil. The diminution of the population in Egypt has in some measure deprived the country of the means of its former advanced state of A.; nor is its present political condition at all likely to lead to much improvement.

Few historical records of the state of *Babylonian A.* have come down to us. We can only judge of its productiveness by the dense population that was supported in the plains bordering the Euphrates, where the summer climate is almost as arid as that of Egypt. That river also was subject to overflow, when the snows melted on the mountains of Armenia in summer. Further than this, however, we have no knowledge of the systems pursued or crops cultivated.

The Scriptures are full of allusions to the operations of the husbandman in *Palestine* as well as in Egypt. The operations in the two countries necessarily formed striking contrasts—the crops in the former being chiefly dependent on the rains for growth; in the latter, on the inundations of the Nile. In the Holy Land there are extensive plains of fertile soil which yielded the finest wheat. The hillsides were covered with vines and olives, often planted on terraces formed with much labor, to afford a larger mass of soil, in which the plants might flourish in the almost rainless summers. The valleys were well watered, and afforded pasture for numerous flocks. Of the smaller cultivated plants, millet was the chief summer crop, but it was only cultivated to a limited extent, being confined to those spots that could be artificially watered. Wheat and barley were the chief cereals, as the winter rains were sufficient to bring them to maturity. The large number of inhabitants that Palestine supported under the Jews is the wonder of all modern travelers, who are struck with the ruins of ancient cities and the desolation of the country. The means of cultivation, however, disappeared with the inhabitants; and the destruction of the wood has added to the aridity of the climate. Concurring testimony indicates that the systems of cultivation were somewhat similar in all the countries bordering on the Mediterranean, which are characterized by arid summers, and autumn and winter rains. Irrigation, therefore, was had recourse to wherever it was practicable.

The A. of *Italy* in the present day exhibits great contrasts in its condition: for while a garden-like cultivation is seen in Lombardy, the utmost rudeness and backwardness prevail in the southern parts of the peninsula. Into the social causes that have led to these results our limits forbid us to enter. The literature of the A. of the ancient Romans throws much light on the systems that then existed in the countries bordering on the Mediterranean. As is well-known, the wide-spread dominion of Rome rose out of a diminutive colony planted on the banks of the Tiber. In the time of the early kings, its original territory did not extend above five m. towards the Alban hills, and still less in other directions. Romulus is said to have divided a portion of his small territory among his subjects, at the rate of little more than an acre to each. This allotment, granted in perpetuity, was not liable to be taxed, and could be sold by its owner. The whole territory was not assigned to the citizens, but the larger part was kept as domain lands, which yielded a revenue to the state, by being let to the wealthy classes. These domain lands were either cultivated or allowed to remain in pasture. The common conditions were that the occupants of the corn-land paid one tenth of the produce as rent; of vines and fruit-trees, one fifth; and a moderate rate a head for sheep or cattle pastured. The occupants were merely tenants-at-will, and the state could resume and sell their lands at any time. A similar policy seems to have been pursued by the numerous states of ancient Italy. As these were all conquered in succession by the Romans, their lands became the property of the Roman state. Sometimes the inhabitants were wholly extirpated, or sold into slavery, and their lands were partly assigned to the poorer citizens engaged in the war; the remainder, which was always the much larger part, became domain lands. In other instances, only a portion of the lands was taken from the conquered nations; the former owners were allowed to retain them as tenants, paying the ordinary rent. Thus, from the earliest times, two classes of cultivators were in existence—the small proprietors, and the wealthy tenants holding the lands of the state. Betwixt the two, there was almost a perpetual strife—the one demanded the distribution of the state domains, while the others constantly resisted it. Even after the Romans became masters of the whole of Italy, the citizens had little more than four acres of land assigned to each; and the domain lands increased enormously. Attempts were constantly made to restrict the extent of domain held by the patricians, but generally without effect. See AGRARIAN LAWS. The great extent of domain lands gave rise to the employment of slave-labor in their cultivation by the wealthy citizens. This led to the discouragement of

small proprietors, so that the free population engaged in A. diminished throughout Italy. The evil was further aggravated by the policy that the Romans pursued towards the inhabitants of the conquered provinces: there none of the land was held as freehold, but it was solely vested in the Roman people, being all let out for the benefit of the state. On the conquest of Sicily, the wealthy Romans flocked over, and farmed the rents, as well as cultivated the lands by means of slave-labor. Indeed, the chief supplies of grain sent to Rome from Sicily, Sardinia and Carthage were raised by means of slaves. A. was long the only source of wealth open to the patricians; and it was deemed the most honorable of occupations. Its operations were then directed by men of wealth and learning; and no wonder that its literature was so copious, and held in so high estimation. Cato, the first and most celebrated agricultural writer (who d. aged 88, 150 B.C.), was in the middle period of life at the end of the second Punic war. The large farming system had then been fully established; and he gives us not only the most minute particulars regarding the management of the slaves on his Sabine farm, but all the details of husbandry, from the plowing of the fallows to the reaping and threshing of the crop.

The chief grain cultivated by the Romans was wheat, but barley was also cultivated to a considerable extent. Land devoted to grain was fallowed for a whole year every alternate year; in other words, the rotation consisted of, 1st, wheat; 2d, fallow. One third of the fallow was manured and sown with some green crop as cattle-food. Fallow received from four to five furrows before the wheat was sown in autumn. The last plowing left the land in narrow ridges; and as the seed was sown broadcast, it came up in rows, which admitted of the crop being several times hand-hoed. The crops of wheat ripened about the middle of June, but the summers were too dry to allow of millet and other summer crops being raised with certainty. Rye, hemp, flax, beans, turnips, lupines, vetches and lucerne are also mentioned as occasionally cultivated. Meadows were highly esteemed, and irrigation to some extent adopted. Cattle were fed in the plains in winter, and driven towards the Apennines as the snows melted in spring, and when the pastures below became parched by the heat. The greater portion of the surface of southern Italy consists of thin calcareous soils, ill adapted for the growth of grain or grass; and the vine, the olive and the mulberry become the chief object of culture. The principal districts for growing wheat are in the neighborhood of Naples, and in the ancient Apulia, where Hannibal generally wintered when he overran Italy. Some of these rich plains are still held directly from the government, and cultivation is of the rudest character. One third of the land is in pasture, and the other two thirds in fallow and grain. Three or four crops are taken in succession, and the soil is then allowed to recruit its exhausted strength by remaining under pasture.

In the great plain of northern Italy watered by the Po, A. is now in a very advanced condition. A great part of it is of great natural fertility; it drew forth the praises of Polybius, who visited it about fifty years after it came into the hands of the Romans. The oak-groves which he found scattered over the plain fed the immense droves of swine that were then raised in Italy. Now, however, rich and poor soils are subjected to the fertilizing influences of irrigation, and the region has become the best cultivated in Europe. No less than 1,600,000 acres of land are under irrigation, and the results are of the most striking character. The land is forced to produce a constant succession of grass and grain. The irrigated meadows, like the pastures of Ireland and Scotland, are made the corner-stone of the systems of rotation. In general, three years in meadow are succeeded by three years in rice; two years in Indian corn and flax; one year in wheat sown out with grass-seeds. Large numbers of cattle are kept on the farms of Lombardy, where the land is often a complete net-work of canals, with their smaller distributing channels. There is a large exportation both of grain and dairy produce. The vast ranges of snowy mountains that bound the plain to the north afford a never-failing supply of water during the heats of summer. The vine and mulberry beautify the country, and also give employment to the dense population.

The lower latitude of *Spain* gives it a still more arid summer climate than Italy. Rains commonly fall only during the autumn and winter, and the supply is scanty and irregular. This renders Spain a poor and unproductive country, excepting where the soil can be irrigated. For this reason, the resources of its A. are chiefly confined to its well-watered valleys, which are capable of being made to outstrip Egypt itself in productiveness. The Moors early introduced the art of irrigation in the s. of Spain, and carried it to a high pitch in the kingdom of Granada. Before the conquest of that country by Ferdinand and Isabella, the valley of Granada was one well-cultivated garden. Though the undiminished powers of the land are still attested by a few spots in the *regas* of Murcia and Granada, its present condition cannot be compared to its condition under the Moors. The high temperature admits of a succession of crops being raised in one year, as in Egypt. After wheat has been gathered in June, a crop of maize or millet or of vegetables is got. Maize is scarcely grown in Spain except where the land is irrigated, so that every valley is more or less under the productive influences of water. The melting of the snows in summer on the high ranges of mountains, affords a supply when it is most needed in the plains below. Vines, olives and oranges find a genial climate for their growth in the southern parts, and are important objects of culture.

*France* must be regarded as one of the richest agricultural countries in Europe. In the s., the climate is sufficiently hot for olives, maize, the mulberry and the vine. The

summer rains, too, are more abundant than in Spain, and permit maize to be extensively grown alternately with wheat, which forms a most productive course of crops. Irrigation has received considerable attention in the southern valleys, and the reclamation of the barren wastes of the Crau in Provence, testifies to its fertilizing effects. Much of the soil is poor in the southern provinces, and not suited to the growth of grain; but such soil admits of the growth of the mulberry, the olive, or the vine. All these crops demand a large amount of labor in their culture, and sustain a dense population. Normandy is celebrated for its pastures. The n.w. of France generally is the most fertile tract of land in Europe. In the less advanced districts, fallow wheat and oats is the rotation still followed. Clovers and lucerne are largely sown in the chalky districts. In the best cultivated districts in the n., wheat and beet-root or poppy are sown alternately. Beet forms a most important plant in the A. of France in the present day, as a large part of the sugar consumed in the country is derived from it. Much of France is divided into small properties, which is more especially the case in the less fertile provinces. This division of property is so far a necessity, as no other industrial occupation is open to the people. As soon as manufactures raise the standard of living in the town, it will influence the condition of the rural population, and lead to the enlargement of properties.

In *Austria, Hungary*, and the countries on both sides of the Danube, the climate resembles that of the southern half of France. Maize and wheat are the chief products, but the A. labors under so many impediments to progress, that it is yet in a backward state. In southern *Russia* there are vast tracts of rich land bordering on the rivers flowing into the Black sea and sea of Azov, from which western Europe derives large supplies of wheat and flaxseed, as well as some maize. The northern parts of *Russia* are less fertile, and as yet the means of transport is defective and limited. Oats, flax, skins, and tallow are the chief products sent to market. Rye forms the common bread-corn of the lower classes. *Prussia*, unless along the shores of the Baltic, has no great proportion of fertile land within her territory: the chief article exported is wheat from the Baltic provinces, which is of fine quality. The potato enters largely into the food of the common people in *Prussia*, and is also used in the manufacture of ardent spirits. Its A., however, has no peculiarities deserving of special notice in this cursory sketch.

*Flanders* has long been celebrated for its farming, and its cultivators are generally supposed to have carried improved systems into the eastern counties of England. It is characterized by painstaking management, and, at the same time, liberal application of manure. The general size of the farms would be considered rather small in England, but considerable capitals are invested in stock and implements, and several kinds of crops are raised unknown to British A. A large part of the stock is stabled throughout the year, the grass being cut and carried from the fields. The rearing and the feeding of cattle, as well as the dairy, are often combined on the same farm. Flax is a crop which receives a great deal of careful management. Hemp and beet-root require liberal treatment with respect to manure, and only enter into the rotation where high farming is followed. The crops are so arranged in the rotation, that two cereal crops do not succeed each other. In no country are the fields kept so free from weeds as they are in *Flanders*, and in none do the agriculturists suffer so little from fluctuations in the price of grain, owing to the great variety of crops that are raised.

*England* had made considerable advances in A. so far back as the 16th c. This fact may be gathered from the writings of Fitzherbert, Tusser, and others. At an early period, her chief article of export had been wool, which supplied the seats of manufacturing industry in Holland, but now she also exports a large quantity of wheat. The increasing prosperity of the country caused a demand for butcher-meat, which began to rise in price much sooner than it did in Scotland. By the middle of the 17th c., turnips and red clover were introduced as field-crops, and by the end of it the two were extensively cultivated in many parts, in alternation with corn. In 1750, the four-course shift was not uncommon in many parts of Norfolk. Under this system of 1st, wheat; 2d, turnips; 3d, barley; 4th, grass, one half of the land was constantly under corn-crops, and the other under cattle-crops. Large numbers of sheep and cattle were fattened on the turnips and clover. In the preparation of the land for turnips, it was well cultivated and weeded, and the consumption of the roots on the land increased the yield of the barley. The four-course shift has formed the basis upon which further improvements have been made in the southern and eastern parts of England. The strong soils of Suffolk and Essex yield good pasture, and about a century ago they were mostly devoted to dairy-farming. The high price of corn, however, encouraged the conversion of these lands into arable farms. The course followed was 1st, wheat; 2d, fallow; 3d, barley; 4th, clover. Instead of the fallow, mangel-wurzel is now largely substituted, which enables the farmers to feed large numbers of bullocks in the yards, without so large an expenditure in the purchase of oil-cake as was at one time thought necessary. In the western counties, where the climate is more suitable for grass, and less so for wheat, dairy and stock-rearing become greater objects of attention. The demand for dairy produce in the neighborhood of the large manufacturing towns of the w., renders the land of much greater value under grass than under corn, more especially where the soil is tenacious. In the more friable soils of the north-western counties of England, the systems of A.

resemble somewhat that of Scotland. Instead of the land lying one year under grass, it lies two, followed by oats, then turnips or potatoes, and the wheat-crop is taken after this green crop, and not after the grass. This is the characteristic which distinguishes the arable farming in the western from that of the eastern counties of England. A large portion of the surface of England is under permanent pasture, and the beauty of the meadows is unrivalled in any part of the world. The surface of England is very unevenly farmed, for while A. has attained a great degree of perfection in such counties as Suffolk, Norfolk and Lincoln, it is in a comparatively primitive state in others. The causes which have led to this state of things are often difficult to trace. The spirit of improvement now seems, however, far more generally diffused, and spirited farmers are everywhere springing up, who, before long, will find many imitators.

In Ireland, the want of manufactures has continued to act as a great hindrance to agricultural improvement. The competition that arose among a generally indigent population in taking small farms, led to extravagant rents, the payment of which involved the starvation of the tenants. The faithful pictures which Arthur Young drew, towards the close of the last century, showed the workings of such a system. The general introduction of the potato, upon which the people chiefly subsisted, enabled rents to be paid by selling the scanty produce of grain, or the pigs that were reared. The failure of the potato-crop in 1846 produced the most heart-rending scenes of misery that have been witnessed in our times. When Young made his tour, it was the common practice, among the small farmers, to take from four to six crops of oats or barley in succession, after which the land was allowed to renovate its powers by the growth of the natural grasses. On the moderate-sized farms the cultivation was better; but turnips had little place in a course of cropping for nearly a century after they were largely cultivated in Norfolk. The Protestant population in the n. of Ireland introduced, at an early period, the culture of flax, which still forms a peculiar feature in the A. of that part of the country. The large amount of manual labor which it requires in its preparation for market has so far served to preserve the cultivators from descending so low in the scale of social existence as those in the s. As a general rule, it is found that the worst land is most densely peopled; the secondary descriptions are in moderate-sized farms; while the best land has hitherto been devoted to pasture, for which the climate is admirably suited. The winters are so mild in the s., that cattle are often not stabled. In Young's time, the Irish graziers were the only class of agriculturists that were possessed of capital. The exodus which took place after the potato failure, has relieved the country of a portion of the redundant population, but it is still too dense in many places.

Scotland made comparatively little or no advance in A. for ages previous to the beginning of the 18th c. Donaldson, who published his *Husbandry Anatomized* ten years before the union, affords a pretty accurate picture of the art as then practiced. The farms were small, and divided into outfield and infield land. On the former, which was furthest from the homestead, the rotation consisted of two years in grass, succeeded by two years in oats. On the infield land, barley, oats and pease were sown in succession, and the whole manure was commonly applied to the barley-crop. The yield of corn was from three to four times the quantity of seed. Pastures were of the poorest description, as no artificial grasses were sown. Little encouragement was held out to rear cattle, for a heifer did not bring more than 20s. in the market—scarcely the price of two quarters of barley at that time. At the union, however, Scotland gained free trade with her wealthier rival, from which flowed the happiest consequences. Every branch of industry shared in the new field opened up, and none more so than A. A large trade soon arose in sending the lean cattle and sheep that were reared on the mountainous wastes, as well as in the low country, to be fattened on the pastures and green crops in the s. A great rise in the prices of stock soon followed, which not only encouraged improved breeds, but enabled cultivators to devote a certain portion of the arable lands to the growth of artificial grasses and turnips. Neither of these were grown previous to the union; but in little more than fifty years afterwards, one farmer in Roxburghshire is said to have had 100 acres of turnips in one year. Towards the end of the century, turnips and artificial grasses formed the basis of improved A. in every county. A great rise in the value of land took place. The war-prices in the beginning of the present century gave a further stimulus to the reclamation of land. The improvements, however, were not effected without a great revolution in the state of the rural population. Formerly, the farms were small, and often labored by the members of a single family. A consolidation of farms took place, which necessitated a great change in the social condition of employers and employed, producing often painful contrasts. Of late years, the commercial prosperity of the country has greatly helped to elevate the rural population, and necessitated improvements in cottage accommodation.

Scottish A. is distinguished for great economy in labor, forming a contrast in this respect to that in the chief corn districts of England. Few farms are to be seen in the richer districts without having a fixed steam-engine for driving the barn and other machinery. Labor-saving machines have also been freely introduced. With soil, climate, and situation, the mode of cropping varies greatly over the country. In the Lothians, the six-course shift is common: namely, 1st, wheat; 2d, beans or potatoes; 3d, wheat; 4th, turnips; 5th, barley or wheat; 6th, grass-seeds. In certain situations, the potato crop has lately been still more extensively planted, occupying the place of the bean or

the turnip. On secondary farms, the five-course rotation becomes more common: 1st, wheat or barley; 2d, grass; 3d, grass; 4th, oats; 5th, turnips or potatoes. The larger proportion of the surface of Scotland, however, is devoted to pasture for sheep and cattle. The mountainous tracts are generally unfit for cultivation. Little else has been done in the way of improving them than digging a few surface-drains, and improving the breeds of the stock they feed. Sheep-farms vary in extent from 1000 to 60,000 acres. A few of the best stock-farms may summer and winter a sheep to the acre, but most require three acres. The black-faced are reared upon the most elevated and exposed ground, while the Cheviots thrive on those parts that are less so. No other food is usually given in winter than what is left on the fields in autumn. Cross-breeds between the Cheviot and the Leicester are reared in the lower ranges, where a supply of turnips may be had to give to the ewes while suckling their offspring. When the sheep are to be fattened, they are taken to the arable districts. The opening of steam-navigation and lately, the system of railways, have been of infinite benefit to Scottish A. in getting a market for fat animals.

In *North America*, the same crops are raised as in corresponding latitudes in Europe. The winters in Canada and the U. S. are much more severe than those of western Europe, while the summers are quite as hot, and far more moist, and hence arise considerable variations in the practices of A. In Canada and the northern states, wheat is the staple article of export. In all the chief exporting districts, wheat and red clover are grown as alternate crops. Betwixt lat. 42° and 39°, wheat is often grown alternately with maize, after the land has been under pasture for some years. Again, betwixt lat. 39° and 35°, the climate is better suited for maize than wheat, which becomes less productive. The best pastoral regions are in south Ohio and throughout Kentucky. Below lat. 35°, maize is much less productive, and the climate becomes suitable for cotton. This plant furnishes the staple article of production from lat. 35° to the shores of the gulf of Mexico. Rice is the most profitable crop in the southern states; but its culture is chiefly confined to the tidal swamps, which can be flooded by fresh water. The sugar-cane is limited to the rich alluvial lands on the banks of the Mississippi as far n. as lat. 31°. Tobacco is a principal crop in Virginia and some other states. The West India islands, surrounded by the warm waters of the gulf, are free from the cold n. winds of the American continent. This circumstance favors the growth of the cane, which is so susceptible of injury from frosts. The rich lands of these islands produce large crops of sugar. Coffee is also grown to a considerable extent on several of the Antilles. On the Pacific coast, the climate is characterized by mild winters and dry summers, so that the methods of A. must conform to those of the countries bordering on the Mediterranean.

The soil of *South America* appears to be much more fertile than that of North America. In the southern parts, the winters are comparatively mild, when contrasted with those on the same lat. in the British possessions. The valley of the Río de la Plata is admirably suited for rearing sheep and cattle, which are found in immense herds in the interior. Brazil is densely wooded, showing the abundance of the rains and the capabilities of the country for the growth of the sugar-cane. In the n., where the dry seasons are of longer duration, there are immense grassy plains called savannahs, covered with herds of wild cattle. Though no cattle were found on the continent when discovered by Europeans, it has been asserted that more cattle are now running wild in South America than the whole domesticated cattle of Europe.

*China* possesses a climate having a great similarity to that of the U. S., east of the Rocky mountains. The winters are cold and the summers moist and hot. Rice forms the great staple crop in the warmer regions of the s., wherever the land can be irrigated. This plant is also cultivated to a limited extent on dry lands, along with millet and maize. The density of the population in China is an indication of the advanced state of its A. The careful manner in which all the refuse of the towns and villages is husbanded and applied to the land, while weeds are not suffered to grow among the crops, is the true secret of the productive A. of the Chinese.

The condition of A. in China shows what we might expect from enlightened policy in the promotion of that of *India*. The monsoons which prevail over Hindostan during summer cause a great luxuriance of vegetation while they last; but the extreme droughts that precede and follow them parch and wither up the shallower-rooted plants. Over a large part of India, irrigation is required to produce many of the crops with certainty. In the tropical latitudes, rice is the most abundant grain-yielding plant, and forms the chief food of the people. The numerous rivers of northern India supply the means of irrigation, and the production of food then becomes a matter of comparative certainty. Where the winters are cool, wheat and barley are grown at that season, and rice, maize, millet, etc., in summer, just as we find in the irrigated valleys of the south of Spain. At the present time, the principal drawbacks to the better cultivation of land are the deficiency in the means of transporting the produce, and the tenure by which the land is held. The immense quantities of cotton and flax which are grown and literally lost for want of a market, is a subject that is beginning to attract attention, since our manufacturers are suffering from the scarcity of raw material.

It would be out of place to give an outline of the A. of the other intertropical countries of the world, which have contributed so little to the common civilization of mankind. Where rains are abundant, the ease with which a subsistence can be got from large herbageous plants, and trees yielding fruit at all seasons of the year, has been justly regarded as

inimical to the progress of society. The productiveness of the banana and the bread-fruit tree, considering the small amount of cultivation they require, is calculated to strike natives of colder climates with astonishment. Capt. Cook eloquently remarks: "Whoever has planted the bread-fruit trees, has fulfilled his duty to his own and succeeding generations as completely and amply as an inhabitant of our rude clime who, throughout his whole life, has plowed during the rigor of winter, reaped in the heat of summer, and not only provided his present household with bread, but painfully saved some money for his children."

In the southern hemisphere, the extent of sea greatly predominates over the land. The vapors which are raised over so vast an expanse of water flow towards the equator, and are chiefly deposited there in copious rains. They are not diverted by the peninsulas of South America, south Africa, or Australia, as they are by the continents of America and Asia. Comparatively sterile regions are the result. Australia and the cape of Good Hope are sparingly supplied with rains, so that their soil is not very productive of grain. Cultivation languishes, and the agriculturist devotes his attention to the rearing of cattle and sheep. New Zealand, however, possesses a climate having considerable resemblance to that of England, and as favorable for the production of grass and grain.

Under the heads of cultivated plants, dairy, domestic animals, drainage, irrigation, implements, manures, soil, rotation of crops, lease, etc., will be more particularly treated the systems and rationale of farm management pursued in the British islands.

AGRICULTURE, DEPARTMENT OF, established by congress in 1862, to collect and diffuse reports and information, distribute seeds, and manage a public botanic garden for testing and introducing to the country new and desirable plants. The commissioner of agriculture, who is the head, is appointed by the president. The D. of A. has a fine building at Washington, with a museum, chemical laboratory, gardens, etc. The monthly reports on the state of the crops and cognate subjects are estimated to be of great value.

AGRICULTURE, STATISTICS OF. The international statistical congress, which met at St. Petersburg in 1872, requested the French government to compile the agricultural statistics of the countries of Europe. Hitherto such statistics have been imperfect, or wholly neglected, and in no country are there to be found any data of the amount and value of staple crops. This serious defect the international statistical congress sought to remedy, and the statistical corps of France undertook to collect the facts. Though by no means complete, the information is valuable, and the leading points are: The average product of cereals of all sorts in Europe is estimated at 5,153,808,000 bushels, of which 1,657,392,000, nearly a third, are assigned to Russia; 766,230,000, or nearly 15 pr. ct., to Germany; 709,500,000, or 14 pr. ct., to France; and 557,600,000, over 11 pr. ct., to Austria-Hungary. Estimating the average consumption at 15.6 bush. per head for food, seed and manufactures. Europe produces usually about enough to meet her own demand, except in wheat and some other breadstuffs, in which a considerable deficiency is supplied by importation. Of potatoes, Ireland produces 23 bush. for each one of her population; German empire, 18.1; Holland, 14.5; Belgium, 11.6; France, 10.2; Scandinavia, 9.9; Austria-Hungary, 8.5; Russia, 4.5; Great Britain, 3.3; Italy, 1.1; Portugal, 0.85; Spain, 0.28, and other states still less.

The production of crops of all kinds in the United States in 1873 is set down at 1,586,442,000 bushels, an aggregate nearly equal to that of Russia, which is 1,637,392,000 bushels. Europe produces a little over 17 bushels per head of her population; the United States, in 1873, almost 40 bushels per head. The value of agricultural exports of the United States in 1873 was \$592,475,813, which was 82 per cent of all domestic exports.

The crop of hay for 1877 showed the amounts—31,629,300 tons, 25,337,703 acres, \$271,934,950 value, one ton and twenty-four hundreds yield per acre, \$8.60 average price, \$10.72 value per acre.

**AGRIGENTUM** (Gr. *Akragas*), the modern Girgenti, a t. on the s. coast of Sicily, in lat. 37° 17' n., and long. 13° 28' e., founded by a colony from Gela (582 B.C.), and, in the earlier ages, one of the most important places in the island. In its palmy days, it is said to have contained 200,000 inhabitants. After being at first free, and then subject to tyrants, it was demolished by the Carthaginians (495 B.C.), but very soon rose again. In the course of the Punic wars, it was compelled to submit to the Romans. From 825 to 1036 A.D., it was in the possession of the Saracens, from whom it was conquered by count Roger Guiscard. The modern city contains (1872) 19,603 inhabitants, is the capital of the province of the same name, and exhibits numerous and splendid ruins, which afford inexhaustible materials for pictorial representation. Among the best preserved of these remains of antiquity is the temple of concord, of which only the roof and part of the front are wanting. The most extensive of the temples was that of Jupiter, 340 ft. long, 120 ft. high, and 160 ft. wide, which, at the time of its destruction, appears not to have been finished. Only the basement and some fragments remain. Considerable ruins of the temples of Juno Lucina, of Hercules and Æsculapius are still found. The trade of the modern city is inconsiderable. Some corn, fruit, oil, etc., is exported, but the harbor is little frequented.

**AGRIMONY** (*Agrimonia*), a genus of plants of the natural order *rosaceæ* (q. v.), sub-order *potentilleæ*. The calyx is five-cleft, without bracts; the hardened tube at length invests two carpels, and is covered with hooked bristles.—The COMMON AGRIMONY (*A. eupatoria*) is a native of Britain and other parts of Europe, growing in borders of fields, on waysides, etc. It has an upright habit, attains a height of 2 ft. or more, and has interruptedly pinnate leaves, with the leaflets serrate and downy beneath. The flowers are small and yellow, in close racemes. The whole plant has a pleasant, slightly aro-

matic smell, and is bitter and styptic. A decoction of it is used as a gargle; the dried leaves form a kind of herb tea; and the root has some celebrity as a vermifuge.—Very similar to this is *A. suaveolens*, a native of Virginia, Carolina, etc. It has a very agreeable fragrance.

**AGRIO'NIA**, Boeotian festivals in honor of Dionysus, in which women pretended for some time to search for the god, but suddenly desisted, saying that he hid himself among the muses. The tradition is that the daughters of Minyas having despised the rites of the god, were seized with frenzy and ate the flesh of one of their children; and that the A. were celebrated in expiation of the offense.

**AGRIPPA**, CORNELIUS HENRY, a remarkable character of the 16th c., distinguished as writer, philosopher and physician, who united great ability and extensive acquirements with quackery, was born of a noble family at Cologne, 1486. He led an adventurous and unsettled life, quite in the spirit of his times. As early as 1509, he was appointed teacher of theology at Dôle, in Franche Comté, and attracted great attention by his lectures; but having by his bitter satires on the monks drawn upon himself the hatred of that body, he was accused of heresy, and obliged to leave Dôle. He next taught theology for some time in Cologne, occupying himself at the same time with alchemy, and then went to Italy, where he took military service under Maximilian I., and was knighted. He was afterwards made doctor of laws and of medicine, and gave lectures at Pavia, until, burdened with debt, he fled to Casale. After a time he was appointed syndic of Metz; but in 1530 he was again in Cologne, having excited the hostility of the inquisition and of the monks by his defense of a witch. His old enemies, the monks, persecuted him still in Cologne, so that he went to Freiburg in Switzerland, where he began to practice as a physician. In 1524, he went again to Metz, and there he gained such a reputation that the mother of Francis I. chose him as her physician. As he declined to prophesy the issue of the campaign that Francis I. undertook in 1525 in Italy, he lost his post and went to Holland. Here he wrote his celebrated book, *De Incertitudine et Vanitate Scientiarum* (Cologne, 1527), a biting satire on the sciences as they then existed. An accusation against him having been brought before Charles V., on account of this book, he again became a fugitive, and repaired to Lyon. He there found the hatred he had early excited in France not yet extinguished, and was imprisoned; but being liberated, through the exertions of his friends, he retired to Grenoble, where he d. (1535). A. was a clear-headed man, and had the merit of successfully combating many of the prejudices of his age. His book, *De Occulta Philosophia*, containing a systematic account of the cabala (q.v.), directly contradicts the above work. A complete collection of his writings appeared at Lyon, 2 vols., without date (about 1550). See Life of A., and analysis of his works, by H. Morley (1850).

**AGRIPPA**, HEROD, I., son of Aristobulus and Berenice, and grandson of Herod the great, was educated at Rome. He lived there in a very extravagant style, giving splendid entertainments, especially to the princes of the imperial family, and scattering his money lavishly in gifts to the freedmen of the emperor, until his debts rendered it unsafe for him to remain longer in the city. He then took refuge in Idumea. From this period almost to the death of Tiberius, he suffered a variety of misfortunes, but having formed a friendship with Caligula, the latter, on his accession to the throne, gave him the tetrarchies of Abilene, Batanea, Trachonitis and Auranitis. After the banishment of Herod Antipas, he received his tetrarchy also—namely, Galilee and Perea. Claudius, whom A. helped to secure the possession of the empire, added to his dominions Judea and Samaria, and he was thus the ruler of a more extensive territory than even Herod the great had been. His government was mild towards the Jews, with whom he was remarkably popular; but he severely persecuted the Christians. He caused James, the brother of John, and the head of the church at Jerusalem, to be beheaded, and Peter to be thrown into prison. He d. of a peculiarly loathsome disease at Cæsarea, in Palestine, while celebrating games in honor of the emperor, in the 55th year of his age, and the 44th of the Christian era. The account given of this in the Acts of the Apostles substantially agrees with that of Josephus.

**AGRIPPA**, HEROD, II., son of Agrippa I., was at Rome when his father died, and only 17 years of age. Claudius, therefore, resolved to detain him for some time, and in the meanwhile retransformed the kingdom into a Roman province, but presented him with the little territory of Chalcis when his uncle Herod, who was its ruler, died. In 53 A.D., he left Rome, and received from the emperor nearly the whole of his paternal possessions, which were subsequently enlarged by Nero. Like his father, A. was fond of fine buildings, a taste which he probably acquired by his long sojourn at Rome. He spent great sums in adorning Jerusalem, Berytus, and other cities; but he was not prudent in the distribution of his favors, or just in his treatment of the high-priests, so that he failed to secure the good-will of the Jews. He did all in his power, however, to dissuade them from rebelling against the Romans; but when he found his advices and warnings neglected, he abandoned his countrymen, and joined the imperial troops. When Jerusalem was taken, he went with his sister to live at Rome, where he was made prætor, and where he died in the 70th year of his age—the last of the Herods. It was before him Paul made his memorable defense.

**AGRIPPA**, MARCUS VIPSANIUS (63-12 B.C.), a Roman, who, though not of high birth, rose to an exalted position through his own talents. He first espoused Marcella, the niece, and then Julia, the daughter of Octavius. He was eminent both in war and in peace; and as a general, counselor and friend of the emperor, did good service to him and to the Roman state. As a general, he laid the foundation for the sole dominion of Octavius, and commanded his fleet in the battle of Actium (31 B.C.). He was generous, upright, and a friend to the arts; Rome owed to him the restoration and construction of several aqueducts, and of the Pantheon, besides other public works of ornament and utility.

**AGRIPPINA**.—I. The daughter of M. Vipsanius Agrippa, by his wife Julia, was one of the most heroic and virtuous women of antiquity. She was married to Caesar Germanicus (see GERMANICUS), whom she accompanied in all his campaigns. She openly accused Tiberius before the senate of having hired the murderers of her husband; and the tyrant, who hated her for her virtues and the esteem in which she was held by the people, banished her to the island of Pandataria, near Naples, where she voluntarily died of hunger (33 A.D.). The antiquarian museum at Dresden possesses four excellent busts of her.—II. A very different character was AGRIPPINA, the daughter of the last mentioned, one of the most detestable women that have lived. In her second widowhood, she induced the emperor Claudius, her own uncle, to marry her, and espoused his daughter, though already betrothed to another, to her son Nero. In order to bring the latter to the throne, she ruined many rich and noble Romans, excluded Britannicus, the son of Claudius by Messalina, and finally poisoned the emperor, her husband. She then endeavored to govern the empire through her son Nero, who was chosen emperor; but her ascendancy proving intolerable, Nero caused her to be put to death (60 A.D.). She enlarged and adorned her native city, Cologne, which received from her the name of Colonia Agrippina.

**AGTELEK**, Cavern of (in Hungarian, *Baradla*, i.e., a suffocating place), one of the largest and most remarkable stalactitic caverns of Europe, is situated near the village of Agtelek, in the co. of Gomor, not far from the road from Pesth to Kaschau. It opens at the foot of a mountain with an entrance scarcely  $\frac{3}{4}$  ft. high by 5 ft. wide. It consists of a labyrinth of caverns communicating with one another, many of which it is difficult, and even dangerous, to explore, when the streams that flow through them are high. Numerous stalactitic structures occur in all the caverns, which, from their singular shape, have given rise to the various names of "the Great Church," "the Mosaic Altar," "the Image of the Virgin," etc. The largest and most imposing of those caverns, situated about 200 paces from the entrance, is called the *Flower-Garden*. It is 96 ft. high, 90 ft. wide, and runs nearly 900 ft. in a straight line.

**AGUA**, VOLCAN DE, a conical volcanic mountain, 25 m. s.w. of Guatemala, 15,000 ft. above sea-level. Its crater is about 450 ft. by 350 ft. It ejects stones and hot water. Near by are the volcanoes of Pacaya and Fuego, and the three often present a magnificent spectacle. Agua has twice destroyed the old town of Guatemala.

**AGUADO**, ALEXANDER MARIA, Marquis de Las Marismas del Guadalquivir, one of the wealthiest bankers of modern times, was b. at Seville, 1784, and d. 14th April, 1842. He was descended from a Jewish family, and in his youth bore arms as a soldier. During the Spanish war of independence, he fought with distinction on the side of Joseph. rose in the French army to the rank of colonel, and acted as aid-de-camp to marshal Soult, but retired in 1815, and began a commission business at Paris. In this he soon realized such wealth as enabled him to found a bank. Good-fortune, energy and boldness, with a singular talent for concerting schemes, advanced him in a short time to be one of the first bankers in Paris. He also obtained a political reputation by negotiating the Spanish loans of 1823, 1828, 1830 and 1831. In these operations, the Spanish government frequently invested him with unlimited powers, which he dexterously employed to save his country from national bankruptcy. Ferdinand VII. conferred on him the title of Marquis de Las Marismas del Guadalquivir. His services were also recompensed by privileges in mining and in executing public undertakings. All the Spanish bonds issuing from his house received the name of *Aguados*. It was through A. that the Greek loan of 1834 was effected. He was naturalized in France in 1828, and at his death left a fortune of above 60 million francs, of which he had invested part in landed property; the castle of Château-Margaux, celebrated for its wine, belonged to him. His distinguished collection of pictures gave occasion to Gavard for the publication of the *Galerie A.* (Paris, 1837-1842).

**AGUAS CALIENTES**, a well-built t. in Mexico, in the province of Zacatecas. It is situated in n. lat.  $21^{\circ} 53'$ , and w. long.  $101^{\circ} 45'$ , in a plain 6000 ft. above the sea-level, and on a stream of the same name, which is tributary to the Rio Grande de Santiago. It contains a pop. of 20,000; and besides the cultivation of fields and gardens, the manufacture of woolen cloth is very considerable, and is carried on on the factory system. The t. is favorably situated for trade, as the great road from Mexico to Sonora and Durango is here crossed by that from San Louis Potosi to Guadalajara. The environs abound in hot springs, from which the t. takes its name.

**AGUE** (*febris intermittens*) is the common name for an intermitting fever, accompanied by paroxysms or fits. Each fit is composed of three stages, the cold, the hot and the sweating stage. Before a fit, the patient has a sensation of debility and distress about the epigastrium; feels weak and disinclined for exertion; the surface of his body becomes cold, and the bloodless skin shrivels up into the condition termed goose-skin (*cutis anserina*). A cold sensation creeps up the back, and spreads over the body; the patient shivers, his teeth chatter, his knees knock together; his face, lips, ears and nails turn blue; he has pains in his head, back and loins. This condition is succeeded by flushes of heat, the coldness gives place to warmth, and the surface regains its natural appearance. The warmth continues to increase, the face becomes red and turgid, the head aches, the breathing is deep and oppressed, the pulse full and strong. The third stage now comes on; the skin becomes soft and moist, the pulse resumes its natural force and frequency, and a copious sweat breaks from the whole body.

These paroxysms recur at regular intervals. The interval between them is called "an intermission." When they occur every day, the patient has *quotidian* A.; every second day, *tertian*; and when they are absent for two days, *quartan*. All ages are liable to this disease; and a case is on record of a pregnant woman having a tertian A. which attacked her of course every other day; but on the alternate days, when she was well, she felt that the child also had A., although the paroxysms did not coincide with her own.

The exciting causes of this disease are invisible effluvia from the surface of the earth (marsh miasmata). A certain degree of temperature seems necessary—higher than 60° Fahrenheit—for the production of the poison. It does not exist within the arctic circle, nor does it appear in the cold seasons of temperate climates, and seldom beyond the 56° of n. lat. (Watson). It also requires moisture. In England A. is almost exclusively confined to the eastern coast; and the extension of drainage has rendered A. far more rare than before. James I. and Oliver Cromwell died of A. contracted in London. The Pontine marshes to the s. of Rome have long been notorious as a source of aguish fevers. Peat bog or moss is not productive of malaria, as is seen in parts of Ireland and Scotland. Neither is A. ever seen among the inhabitants of the Dismal Swamp—a moist tract of 150,000 acres on the frontiers of Virginia and North Carolina in North America. The treatment of aguish fever consists generally in calomel given in purgative doses, followed by preparations of cinchona-bark, and in applying, during the paroxysm, external warmth to the body.

**AGUESSEAU, HENRI FRANÇOIS D'**, a distinguished lawyer and chancellor of France, and pronounced by Voltaire to have been the most learned magistrate that France ever possessed, was born at Limoge, 1668 A.D. He received his earliest education from his father, and afterwards devoted himself to the study of law; became *avocat-général* at Paris in 1690, and at the age of 32, *procureur-général* of the parliament. In this office he effected many improvements in the laws and in the administration of justice. He displayed great benevolence during a famine which occurred in the winter of 1709, applying all the means in his power for the alleviation of the calamity. As a steady defender of the rights of the people and of the Gallican church, he successfully opposed the decrees of Louis XIV. and the chancellor Voisin in favor of the papal bull *Unigenitus* (q.v.). During the government of the duke of Orleans he became chancellor, but in the following year fell into disgrace by opposing Law's system of finance, and retired to his country-seat at Fresnes. When, however, the ruin induced by Law's system produced a general outcry of dissatisfaction, A. was reinstated, in order to appease the people. But his well-meant efforts could not retrieve the desperate state of affairs. A. was afterwards exiled a second time, in consequence of his opposing cardinal Dubois; and though he (in 1727) obtained from cardinal Fleury permission to return, yet he did not again resume the office of chancellor till 1737. He resigned in 1750, and d. Feb. 9, 1751. His works, consisting of pleadings and speeches at the openings of the parliament, occupy 13 volumes (Paris, 1759-89; Paris, 1819).

**AGUILAR, GRACE**, 1816-47; an English authoress of Hebrew parentage, and a writer chiefly of religious fiction, such as *The Martyr* and *Home Influence*. She wrote in defense of her faith *The Spirit of Judaism*, and other works. The "Women of Israel" gave her a testimonial shortly before her death.

**AGUILAR DE LA FRONTERA**, a t. of Andalusia, Spain, in the province of Cordova, occupying the summits and slopes of several low hills on the left bank of the Cabra, 26 m. s.s.e. from Cordova. Many of the houses are of three stories, and the t. is remarkable for the whiteness of its houses and the clearness of its streets. It has three fine squares, and a dismantled Moorish castle. The chief trade is in corn and wine. Many of the inhabitants are employed in agriculture, and in the breeding of oxen, horses and mules. Pop. 12,000.

**AGUIRRE, or AGUIRRA, JOSÉ SAENZ DE**, 1630-99; a Spanish ecclesiastic and author, of the Benedictine order; abbot of St. Vincent, professor of theology in the university of Salamanca, and secretary to the Spanish inquisition. He was made cardinal about 1686, in reward for a work in which he supported the papal authority against the four articles of the Gallican church. He wrote a *Collection of the Councils of Spain*, and left unfinished a *Treatise on the Theology of Anselm*.

**AGUIRRE, LOPE DE**, a Spaniard of the 16th c., noted for his crimes. He went to Peru with Orsua in search of the mythical El Dorado; induced Orsua to assume kingly authority, and then killed him to seize the power, afterwards killing many who displeased him. He was finally deserted, and captured and executed by the Spanish authorities of Venezuela.

**AGULHAS, CAPE** (meaning needles), the most southern point of Africa, lies about 100 m. e.s.e. of the cape of Good Hope, in lat. 34° 51' s., long. 19° 55' e. In 1849, a lighthouse was erected on it, at an elevation of 52 ft. above high-water. The A. bank extends along the whole southern coast of Africa. It is 560 m. in length, and, opposite the cape of Good Hope, as many as 200 in breadth.

**AGUE**, a t. of India, in the territory of Gwalior, the possessions of Scindia's family, on the route from Oojein to Kota, 41 m. n.e. from Kota. It stands in an open plain, 1598 ft. above the sea, is surrounded by a rampart of stone, and has on one side of it a large and fine tank. Pop. about 80,000.

**AGUSTINA**, the "maid of Saragossa," d. June, 1857, at a great age. In youth she was a peddler of cool drinks to soldiers. During the siege of Saragossa by the French, in 1809, she distinguished herself by heroic participation in several severe encounters, once snatching the fuse from a falling cannonier and firing the gun at the enemy, from which act she got the name "La Artillera." She was made sub-lieut. in the Spanish army, and presented with many decorations. Byron immortalized her in *Childe Harold*.

**AGYNIA'NI**, or **AGYNIANS**, a Christian sect at the end of the 7th c., who condemned marriage, and declared a true Christian life to consist of the renunciation and mortification of all physical appetites and passions.

**AHAB**, the son and successor of Omri, was king of Israel from 918 to 897 b.c. He married Jezebel, the daughter of Ethbaal, king of Sidon; through whose injurious influence the Phœnician worship of Baal was introduced, the king himself seduced to idolatry, and the priests and prophets of Jehovah cruelly persecuted. Yet the prophets retained their influence over the people; and Elijah dared openly to attack the priests of Baal, and reprove the wickedness of the king with the most severe threatenings of punishment. A. prosecuted three wars, with various success, against Benhadad, king of Syria; but in the last campaign he was killed by an arrow. His whole family was afterwards extirpated under king Jehu.

**AHANTA**, a portion of the gold coast of Africa, rich and fertile. England has stations at Axim and other places ceded by the Dutch in 1872. Prussia undertook to colonize A. in 1683, but in 1718 sold out to the Dutch West India company.

**AHASUERUS** is the name, or rather, perhaps, the title, by which several kings of Media and Persia are mentioned in scripture. The best known of these is Esther's husband (see **ESTHER**), who is probably the same as the Persian king Xerxes; the Hebrew form of his name (*Ahaschverosh*) pointing to the old Persian form of the name Xerxes (*Khschyârschan*).

**AHAZ**, son of Jotham, and 11th king of Judah, reigning 741-725 b.c.; weak-minded and corrupt. In his time Pekah, king of Israel, and Rezin, king of Syria, undertook to capture the kingdom of Judah, and besieged Jerusalem but did not take the city, though they carried away many captives. Incursions were made by the Edomites and Philistines, and Ahaz asked help of Tiglath-Pileser, king of Assyria, who drove out the invaders but took heavy toll from Ahaz, compelling him to appear at Damascus as a vassal, while his kingdom was brought to the lowest point of political degradation. The conduct of Ahaz was that of a heathen; he broke up the sacred vessels, and closed the doors of the temple; he sacrificed to Syrian deities, and caused his son to pass through the fire to Moloch. He was succeeded by his son Hezekiah.

**AHAZIAH**, son and successor of Ahab, and 8th king of Israel, reigning less than two years, 897-95 b.c. He followed his father's idolatry, worshipping Baal and Astarte. On his accession the Moabites first revolted, refusing to pay tribute; and before he was ready to go against them he fell from a window of his palace. He sent messengers to his god to know the result of his injuries; but the messengers met Elijah, the prophet of Jehovah, who sent them back with word that the king would surely die.

**AHAZIAH**, son of Jehoram and Ahab's daughter: 6th king of Judah; reigned one year, 884 b.c. He was idolatrous and wicked, and was slain by Jehu.

**AHIMELECH**, a Jewish high-priest, who, induced by David, supplied the latter's hunger with the shew-bread of the tabernacle, which was forbidden except to the priests; for which Saul caused Doeg to slay A.

**AHITHOPHEL**, probably grandfather of Bathsheba, and by her introduced at David's court. He was a wise man in spite of his name (which means "brother of foolishness"), and David's most trusted counselor until his defection in Absalom's case, which caused the king much sorrow. His advice showed the way of success to Absalom's party, but Hushai's counsel for delay prevailed, which A. believed would be fatal to the rebel cause; and he went home, "put his house in order and hanged himself," the only deliberate suicide recorded in the Old Testament.

**AHL'EFELD, CHARLOTTE SOPHIE LOUISE WILHELMINE VON**, 1781-1849, a German novelist. She married A. 1798, and separated from him in 1807. She was praised by Goethe for her precocious literary talent. She published several sentimental novels under the name of "Eliza Selbig," and others under her real name, and wrote a volume of poems.

**AHL'FELD, JOHANN FRIEDRICH**, b. 1810, a Lutheran pulpit orator of St. Michael's church, in Leipsic. He has published several volumes of sermons.

**AHL'QUIST, AUGUST ENGELBERT**, b. 1826, a Finnish philosopher and poet, professor of Finnish literature at Helsingfors. He is distinguished for ethnographic investigations, especially of the dialects and races of the Uralo-Altaic family. He wrote a grammar of the nearly extinct Wot language. In 1847, he started a Finnish journal, and he has translated some of Schiller's works into Finnish, and written poems.

**AHL'WARDT, THEODOR WILHELM**, son of Christian Wilhelm A., the Hellenic philosopher. Since 1861, he has been professor of oriental languages in Griefswalde university. He is an authority on Arabic literature and history.

**AHMEDABAD**, or more properly AHMADABAD, the chief t. in the district of the same name, in the presidency of Bombay, is situated on the left bank of the Sabarmutty, which flows nearly due s. into the gulf of Cambay. It was built in the year 1412, by Ahmed or Ahmad Shah, and underwent all the vicissitudes of government incident to the cities of Hindostan, till the year 1818, when it finally came under the power of the British. It was formerly one of the largest and most magnificent capitals in the east—in the opinion of a native writer, "the handsomest city in Hindostan; perhaps in the world." Its architectural relics are gorgeous, even in the midst of decay. The Jumna or Juma'ah Masjid, or great mosque, rises from the centre of the city, and is adorned by two superbly decorated minarets, "each of which contains a circular flight of steps, leading to a gallery near the summit. Its domes are supported by lofty columns, regularly disposed; the concave of these cupolas is richly ornamented with mosaic and fret-work. The pavement is of the finest marble." The mosque of Sujat Khan is extremely elegant. There is likewise an ivory mosque, which has obtained that name from the circumstance that although built of white marble, it is "curiously lined with ivory, and inlaid with a profusion of gems, to imitate natural flowers, bordered by a silver foliage on mother-of-pearl." There are also the Fire Temple and the Tower of Silence of the Parsis. A. once abounded in gardens, aqueducts, reservoirs, etc.; but these, especially the gardens, are now sadly defaced and injured. Its prosperity has been almost wholly destroyed by the rapacity of Mahrattas, although at one time it was famous for its manufacture of rich fabrics of silk and cotton, articles of gold, silver, steel and enamel. "It employed many artists in portrait-painting and miniatures," and had extensive trade in indigo, cotton and opium. The old city-walls, built in 1485, which had in the course of ages, and through the assaults of enemies, become very dilapidated, were repaired in 1834 at an expense of 250,000 rupees. Water was also conveyed from the river through the city by means of pipes. It is distant from Bombay 290 m. n.; in lat. 23° n., long. 72° 36'. Pop. '72, 116,873.

**AHMEDNUG'GUR**, or AHMADNUGGUR, an important t. in the presidency of Bombay. It was founded in 1494 by Ahmad Nizam Shah. During the reign of his son, Bootkan Nizam Shah, it reached a high degree of prosperity; but after his death, it witnessed an incessant series of wars, confusions and murders. In 1797 it fell into the hands of the Mahrattas; and in 1803 was surrendered, after a trivial resistance of two days, to gen. Wellesley. It was, however, shortly after restored to the Peishwa; but in 1817, the fort was again occupied by the British. The t. has increased rapidly since it came under British protection and rule. It possesses a most singular defense, in addition to its wall: this consists of an "immense prickly-pear hedge about 20 ft. high, which is so full of sap that no fire will kindle it, and so vigorous that it is almost impossible to force one's way through it." A. contains an English church and a *dheurnsalah* (or place of entertainment for travelers) capable of holding 250 persons. It also possesses a good supply of water by means of aqueducts. It is distant from Bombay 122 m. e., in lat. 19° 6', long. 74° 46'. There are several places of the same name in Hindostan. Pop. '72, 32,841.

**AHMEDNUG'GUR**, or EDUR, a Rajpoot state of Guzerat, in the Mahi Kanta agency, politically connected with the presidency of Bombay. It is under the rule of the rajah of Edur, subject to British sovereignty. The population is estimated ('72) at 217,000.—The principal t. is Ahmednuggur, on the banks of the Haut Mati, a branch of the Sabarmati, in an extensive plain, 92 m. n.n.w. from Baroda. It is surrounded by a fine old stone wall. Pop. 9000.

**AHMEDPUR**, a t. of India, in the native state of Bhawalpur, and 25 m. s.w. from Bhawalpur. The houses are mostly built of mud; but there is a large and lofty mosque, with four tall minarets. There are manufactures of matchlocks, gunpowder, cotton and silk. The pop. has been estimated at 30,000, but other estimates make it much less.

**AHMED SHAH**, b. about 1724; hereditary chief of the Abdali tribes, and founder of the Durrani dynasty of Afghanistan. While a boy he was a prisoner with a hostile tribe, but in 1738 he was rescued by Nadir Shah, who gave him command of a body of

cavalry. On the assassination of Nadir, in 1747, Ahmed, who had failed to capture a Persian treasure train, retreated to Afghanistan and persuaded the native tribes to make him their sovereign. He was crowned at Candahar, Oct., 1747, changing the name of his tribe to the Durrani. By keeping his armies at work in foreign conquests, and interfering but little in the local affairs of the tribe, he soon consolidated his power; and having acquired the koh-i-noor—the famous diamond—and much captured treasure, he had the advantage of great wealth. In 1748 he took Lahore, and in 1751 became minister of the Punjab, and soon subdued all Kashmir. The great mogul having retaken Lahore, he went against him in 1756, entered Delhi in triumph and gave the city to pillage for a month. He took for one of his wives a princess of the royal family, and gave another to his son Timour, whom he made governor of Punjab. He had scarcely left Delhi when the Mohammedan vizier, whom he had left in office, seized the city, killed the great mogul, and set another of the family, a tool of his own, on the throne. At the same time the Mahratta chiefs took occasion for attempts to establish the Hindoo power, and Ahmed had more than once to cross the Indus on war expeditions. Jan. 6, 1761, he defeated the Mahrattas and Sikhs at the great battle of Panipat, but was compelled to hasten back to quell rebellion at home. The Sikhs rose, and he was finally forced to give up the Punjab. He died in 1773, of cancer in the face, and was succeeded by his son Timour.

AH'MED VEFYK PASHA', a Turkish statesman; in 1877 the president of the chamber of deputies. He has been much connected with foreign affairs, especially in negotiations which concerned Russia; and he was ambassador to France in 1860. In the autumn of 1877 he was appointed governor of Adrianople.

AHN, JOHANN FRANZ, 1796-1865; a German grammarian, for many years a teacher in Neuss. He wrote many manuals for teaching German and other languages, and published in English a collection of German poetry. His *Practical Method for a Rapid and Easy Acquisition of the French Language* has passed through many editions.

AH'RENS, HEINRICH, b. 1808; a German writer on law, philosophy, and psychology, who studied at Gottingen. He was concerned in the political troubles in 1831, lectured in Paris, and from 1834 was 14 years professor of philosophy at Brussels. He was a member of the Frankfurt parliament of 1848, and on the committee to draft a new German constitution. For a few years afterwards he held a professor's chair at Gratz, and for the last twenty years has represented the Leipzig university in the first Saxon chamber. Among his works are a *Course of Psychology and Philosophy of Rights; or Natural Rights on a Philosophico-Anthropological Basis*. The last-named work has been republished in several languages, and as an academical text-book in some South American states.

AH'RIMAN (in the Zend, *anro mainyus*, i.e., the malignant, destroying spirit) is, according to the dualistic doctrine of Zoroaster, the personification of malignity, the original source of all moral and physical evil, the chief of the devils and malignant spirits, the king of darkness and of death, and consequently the eternal enemy and opponent of Ormuzd and of his kingdom of light. See ZOROASTER.

A-HULL, a maritime term, used to denote the position of a ship when all her sails are furled and her helm lashed on the lee-side; in such a position she lies nearly with her side to the wind, but with the head turned a little towards the direction of the wind.

It may be convenient to mention in this place that the phraseology adopted by British naval officers and seamen, whether belonging to the royal navy or to the mercantile marine, comprises a large number of words formed on a principle similar to that of *ahead*, with the vowel *a* (a corruption of the Anglo-Saxon preposition *on*, meaning *on*, *in*, *at*) prefixed to a noun. Such are the following: *Aback*, *abast*, *aboard*, *abreast*, *a-cockbill*, *adrift*, *afloat*, *afore*, *aground*, *ahead*, *a-hull*, *a-lee*, *aloft*, *aloof*, *amain*, *amidships*, *an-end*, *apeak*, *ashore*, *astern*, *atrip*, *avast*, *a-weather*, *a-weigh*. Such of these terms as seem to require it, will be found briefly explained under their proper headings.

AI', a royal city of the Canaanites, 12 m. n. of Jerusalem. It existed in the time of Abraham, but is chiefly noted for its destruction by Joshua, who made it "a heap forever, even a desolation." A city which seems to have occupied the site is supposed to have been mentioned in Isaiah, and also after the captivity. Its ruins were said to exist in the time of Eusebius and Jerome, though none are now to be found.

AIDAN, SAINT, one of those distinguished monks of the early Scoto-Irish Church, who were received into the calendar of saints by a sort of acclamation, and without the ceremony of canonization. His period is the middle of the 7th c. He was the first efficient missionary who propagated Christianity in the n. of England. Oswald, the celebrated king of Northumbria, requested the community of Iona to send to his court one of their brethren who would teach the Christian religion to his people. As the history has come down to us, the first person sent was a certain Cormac, who was too dogmatic and intolerant to be a successful missionary. On his returning after a failure, A., who possessed the patience, geniality and popular manners fitted for the task, was successful. He left a great reputation, and, as the earliest promulgator of Christianity in the northern districts, is generally counted the first in the lists of the bishops of Durham.

**AIDE-DE-CAMP**, an officer who may be regarded as a kind of superior confidential attendant upon a general in active service. The A. is the organ of the general. He carries all orders on the field of battle: these he is to deliver in the plainest terms, so as to be distinctly understood; and when so understood, the orders are to be as implicitly obeyed as if the general himself were present and speaking. As an example of the importance of this matter, may be adduced the brilliant but disastrous light-cavalry charge at Balaklava in the autumn of 1854. Lord Raglan sent a message, partly verbal and partly written, to the earl of Lucan, concerning a particular piece of strategy at a certain time and place; the message was misconceived, and the earl of Cardigan was directed to make a military movement, perfectly hopeless in its character, resulting in a very serious cavalry loss; although the incident presented a fine display of heroism united with discipline. An A. also acts as secretary to the general, and assists him in his correspondence, when he has not specifically a military secretary. He aids likewise in dispensing the courtesies of the general's house or tent. Generals are much accustomed to appoint their sons or other relations to this confidential post. The A. vary from one to four in number, according as the commander is a brigadier-general, major-general, lieutenant-general, general, or field-marshal: each receives 9s. 6d. a day besides regimental pay. Before an officer can be appointed as A., he must have been two years with his regiment, and must pass an examination. A. are not removed from the list of their regiments; and, most commonly, are captains. Besides these A. to generals, the queen has the power to appoint any number of A. to herself, in her capacity of nominal head of the army. There are no particular duties attached to the office; but it is much sought after, both as an honor, and as conferring on the holder the rank of colonel in the army. There are 6 who receive daily pay as A., and who take it in turn to attend the queen on state occasions. In the year 1876, there were no fewer than 33 military A. to the queen, of whom 8 were peers of the realm; but of the 33, only 19 belonged to the army; the rest, except two of the marines, being militia officers, whose appointments are purely honorary. In addition to all the above, there are naval A. to the queen, of whom there were 11 in the year 1876.

**AIDE-TOI ET LE CIEL T'AIDERA** (help yourself, and heaven will help you). This moral aphorism was the cry of certain French political writers to the middle classes, about the year 1834, and became the watch-word and title of a society, having for its object to agitate the electoral body in opposition to the government. This, however, was to be done by means strictly legitimate, and chiefly by correspondence and political publications. Most of its founders and active members belonged to the party of *Doctrinaires* (q.v.), as Guizot, who was president for some time, Duchatel, Duvergier de Hauranne, Dubois, Remusat, Thiers, Cavaignac, etc. *Le Globe* newspaper was the organ of the association, and afterwards *Le National*. It had a great share in bringing about the revolution of July 1830, and was at first countenanced by the new government; but after a short time it was dissolved (1832).

**AIDIN**, or **GUZEL-HISSAR**, a t. of Asiatic Turkey, on the river Meander, in the pashalic of Anatolia, built out of the ruins of the ancient Tralles, which was situated on a plateau above the present t. It lies sixty m. s.e. of Smyrna, contains 6000 houses, and a pop. estimated at from 35,000 to 60,000 inhabitants, is 4 m. in circuit, and carries on a trade next in importance to that of Smyrna. It is adorned, like all eastern cities, with numerous mosques and other religious edifices, and has a picturesque appearance.

**AIDONE**, a t. of Sicily, in the province of Caltanissetta, 20 m. e. by s. from Caltanissetta. It crowns the summit of a lofty height commanding a view of the great plain of Catania. It was one of the settlements of the Lombards, who accompanied Roger the Norman in his conquest of Sicily. The road which leads to the t. is very rugged, bordered by luxuriant prickly-pears. Pop. 5920.

**AIDS**. These were originally mere benevolences granted by a tenant to his lord, in times of distress; but gradually they came to be regarded as matters of right, and not of discretion. There were three principal objects for which A. were demanded: 1st, to ransom the person of the lord when taken prisoner; 2d, to make his eldest son a knight; and 3d, to provide a suitable portion to his eldest daughter on her marriage. These A. were abolished by 12 Car. II. c. 24.

**AID OF THE KING** is where the king's tenants pray A. of the K. on account of rent demanded of them by others. In such cases, the proceedings are stopped till the king's or queen's counsel are heard to say what they think fit for avoiding the king's prejudice.

**AIGRETTE**, a French word, used to denote the down or plume (botanically, *pappus*) which is found attached to many vegetable seeds, as the thistle and dandelion. It is also used in reference to the feathery tuft on the heads of several birds, as the heron; and in English zoology the name aigret or egret (q.v.) is applied to the lesser white heron, an elegant bird, with a white body and a feathery crest. Hence the term A. came to be used to designate the long, delicate white feathers which, being stuck upright in a lady's head-dress, are calculated to give a majestic appearance to the person. More recently, the usage has been still further extended, and any head-dress bearing an analogy to a plume, even a bouquet of flowers, fastened with precious stones, is denominated an A.

**AIGUEBELLE**, PAUL ALEXANDRE NEVEUE D', b. 1831; a French naval officer. He entered the service in 1846; was lieut. in 1858, and went into the Chinese service, where

he distinguished himself against the Taepings in 1862-64. He became chief commander of the Franco-Chinese corps, forced the insurgents to fly from several ts., and captured Hong Chow. He was made a mandarin of the first class in China, and an officer of the legion of honor in France. With M. Gicquel he established the arsenal at Foo-chow-foo, and taught the Chinese to construct European vessels, the first Chinese man-of-war being launched under his supervision in 1869, when he was made grand admiral of the Chinese fleet.

**AIGUES-MORTES** (*Aquæ Mortuæ*), a small t. in France—pop. '76, 3167—in the department of Gard, which claims to have been founded by the Roman Marius. It is situated in an extensive marsh, impregnated with sea-salt, and is about 3 m. from the Mediterranean, with which it is connected by a canal. It was from A. M. that St. Louis sailed in 1248, and again in 1270, for the crusades—a proof that the sea then reached this spot. In 1538, Francis I. had an interview at A. M. with Charles V.

**AIGUILLE** (Fr., a needle), an instrument often used by military engineers, to pierce a rock for the reception of gunpowder, when any blasting or blowing-up is to be effected.

**AIGUILLETTE**, a part of the decorations of military dress. It was formerly worn on the right shoulder by general officers of various grades; but is now chiefly confined to officers of the life-guards and horse-guards. It is merely an ornament, composed of gold or silver cords and loops.

**AIGUILLON**, ARMAND VIGNEROT DUPLESSIS RICHELIEU, Duc d' 1720-82; minister of foreign affairs under Louis XV., governor of Brittany in 1758. He was replaced as minister by Vergennes, and retired to private life. It is supposed that he owed his place at court to the king's mistress, Mme. Dubarry.

**AIGULET**, a rope called a lashing-rope, employed in ships-of-war for securing the breaching of a gun.

**AIKEN**, a co. in S. C., formed in 1873; 900 sq. m. on the e. side of Savannah river, pop. '80, 28,122. There are mineral products, and agriculture and manufactures of cotton, paper, and pottery are the chief occupations. Co. seat, Aiken.

**AIKEN**, a t. in A. co., S. C., 17 m. from Augusta, on the S. C. railroad; a favorite resort for pulmonary invalids, being 600 ft. above sea-level. It has wide and fine streets, churches, newspapers, lyceum hall, reading-room, and numerous hotels and boarding houses. Pop. '80, 1817.

**AIKEN, CHARLES AUGUSTUS**, D.D., LL.D., a native of Vt., b. 1827; graduated at Harvard 1846, and in theology at Andover in 1853. He was pastor of a Congregational church in Yarmouth, Me., 1854-59; latin professor at Dartmouth in 1859, and at Princeton in 1866-69; president of Union college 1869-71; and later, professor of Christian ethics in Princeton theological seminary. He is editor of *The Book of Proverbs* in Lange's commentary, and author of many articles in religious periodicals.

**AIKIN, ARTHUR**, 1773-1854; son of Dr. John A. He published *Journal of a Tour through North Wales and Shropshire*, edited the *Annual Review*, 1803-8, and with his brother Charles published a *Dictionary of Chemistry and Mineralogy*. Subsequently he prepared a manual of mineralogy. He was one of the founders of the geological society, and a fellow of the Linnean society.

**AIKIN, JOHN**, 1747-1822; an English author and editor. He studied medicine and surgery under the celebrated Dr. Wm. Hunter, but tried practice in various places without success, and turned his attention to literary pursuits, in which he was assisted by his sister, Mrs. Barbauld, with whom he published a series of volumes entitled *Evenings at Home*, an instructive and entertaining miscellany for the young. He wrote also *The Natural History of the Year*, a valuable *Biographical Dictionary*, and other books; edited the *Monthly Magazine* from 1796 to 1807, and started the *Athenæum*, which soon stopped.

**AIKIN, LUCY**, 1781-1864; daughter of John A.; a historical writer who greatly assisted her father. She wrote books for the young, such as *Adventures of Ronaldo and Lorimer*; also published poems under the title of *Epistles to Women*. Her most important work is *Memoirs of the Court of Elizabeth*, which went through several additions. One of her latest works was *Memoirs of Addison*. She was one of the most accomplished and attractive women of her time.

**AIKMAN, WILLIAM**, 1682-1731; a Scottish painter who traveled in Italy and Turkey, practiced his art in Edinburgh and London, and was on intimate terms with artists and men of letters.

**AILANTO** (*ailanthus glandulosa*), a lofty and beautiful tree, of the natural order *xanthoxylaceæ* (see *XANTHOXYLON*), a native of China, but now frequently planted to shade public walks in the s. of Europe, and not uncommon in England. The styles are combined at the base, the fruit consists of 3 to 5 *samaræ* (or winged *achenia*, q.v.). The leaves are large and pinnate, with an odd leaflet, resembling those of the ash. The tree grows better than almost any other on chalky soils, and is hardy enough to endure the climate even of the n. of Scotland. It is easily propagated by suckers and cuttings of the roots. The wood is fine grained, satiny, and suited for cabinet-making.

**AILANTHUS SILKWORM**, *samia cynthia*, found on the leaves of the ailanthus, on which it feeds. Its silk is much used in China, and some think that it may supersede the true silk, the worm being hardier and less subject to disease, and feeding on a tree grown in all temperate climates. The eggs are treated like those of the regular silkworm; the larvæ, after feeding through the first moult, being placed on the trees and left to themselves.

**AILETTES** (Fr., little wings) were appendages to the armor worn by knights in the 13th c. They were sometimes made of leather, covered with a kind of cloth called *carda*, and fastened with silk laces. The form was sometimes circular, sometimes pentagonal, cruciform, or lozenge shaped, but more usually square. Sometimes they were not larger than the palm of the hand; in other instances as large as a shield. In most instances, the A. were worn behind or at the side of the shoulders. Whether the purpose of these appendages was as a defense to the shoulders in war; as an ensign or mark, to indicate to the followers of the knight his place in the field; or as armorial bearings, is not now clearly known; but the first supposition is the most probable. A. are figured on many eagles, monumental brasses, and stained windows, in our cathedrals and old churches.

**AILLY, PIERRE D', or PETRUS DE ALLIACO**, 1350-1425; a French theologian called the "hammer of heretics" and "eagle of doctors;" leader of the Nominalists, and early a doctor of the Sorbonne; grand master of the college of Navarre in 1384, and in 1389, chancellor of the university; bishop of Cambrai in 1398; confessor and almoner to Charles VI. He induced the calling of the council of Pisa, of which he was an active member. He was made cardinal by John XXIII., and sent legate to Germany, where he was prominent in the council of Constance, 1414-18, furthering the condemnation of Huss and Jerome of Prague, but strenuously advocating reform in the church; maintaining the authority of councils over that of popes, and aiding in the election of Martin V. in place of three rival popes. He was afterwards papal legate to Avignon until his death. His writings are numerous. Among them is an attempt to harmonize astronomy and theology, the astronomy being that of the age, soon to be overturned by Copernicus and Galileo.

**AILRED, EALRED, ETHELREDUS, or ALURED**, an English ecclesiastic and historian. He was educated at the Scotch court, entered the Cistercian order and became a monk in Rievaulx abbey, in Yorkshire, becoming abbot in 1146, and remaining so till his death. He was the author of many historical and theological works, the former of little value owing to his unlimited credulity. Leland says he saw A.'s tomb at Rievaulx adorned with gold and silver ornaments.

**AILSA CRAIG**, a remarkable islet about 10 m. from the southern coast of Ayrshire, opposite Girvan, lat. 55° 15' 12" n., long. 5° 7' w. Rising abruptly out of the sea to a height of 1114 ft., it forms a most striking object, even at a considerable distance. It is about 2 m. in circumference, and is accessible only at one point, where the accumulation of debris has formed a rough beach. The rock may be described generally as a mass of trap, assuming in some places a distinct columnar form, with dimensions far exceeding those of the basaltic pillars of Staffa. On the n.w., perpendicular cliffs rise to a height of from 200 to 300 ft.; on the other sides, the Craig descends to the sea with a steep slope, covered with grass and wild flowers, with numerous scattered fragments of rock. The only inhabitants are goats, rabbits, and wild-fowl. Solan geese, in particular, breed in the cliffs in countless numbers. About 200 ft. from the summit are some springs, and on the ledge of a crag on the eastern front, are the remains of an ancient stronghold. In 1831, the late earl of Cassillis, the proprietor of A. C., was raised to the dignity of marquis of A.

**AILURUS FULGENS**. See PANDA, *ante*.

**AIMARD, GUSTAVE**, b. 1818, a French novelist. He went to America as cabin-boy, and lived ten years among the Indians; traveled in Spain, Turkey, and the Caucasus, mixing in wars and conspiracies. In 1848 he was in Paris, and an officer of the *garde mobile*. A. has published his adventures in a long series of novels, *The Trappers of the Arkansas* and *Nights in Mexico*, etc. Under a fictitious name he published, in 1847, *Un Coin du Rideau*.

**AIMÉ-MARTIN, LOUIS**, 1781-1847; a native of Paris, who in 1815 was appointed editing secretary to the chamber of deputies, and not long afterwards professor of belles-lettres, moral philosophy, and history in the polytechnic school. In 1831, he became keeper of the library of Sainte Genéviève. In 1810 he published *Lettres à Sophie sur la physique, la chimie, et l'histoire naturelle*, in prose and verse; and afterwards the *Life of Bernardin de St. Pierre*, in the literary style of his celebrated subject. But his most valuable work is *Éducation des mères de famille*, showing that the only way to improve mankind is to educate women so that they may be able to raise up men of virtue. His wife, a daughter of the marquis of Belleport, was the widow of Bernardin de St. Pierre, whom she took for her husband in his 63d year, she being 18. She died in the same year with her second husband, bequeathing her fortune to Lamartine, with whom she was a special favorite.

**AIMON**. See AYMON, *ante*.

**AIN**, a river in France, rises in the mountains of the Jura, flows through the departments of Jura and A., and after a course of about 100 m., falls into the Rhone, 18 m. above Lyon.

**AIN**, a frontier department of France, is bounded on the n. by the departments of Jura and Saône-et-Loire, on the e. it is separated from Switzerland and Savoy by the Rhone, which also divides it from Isère on the s., while on the w. the Saône separates it from the departments of the Rhone and Saône-et-Loire. The eastern part is mountainous; but the southern portion of that part which lies to the w. of the Ain forms an argillaceous plateau, abounding with marshes, which occasion epidemic fevers. This dep. contains five arrondissements—Bourg, Belley, Gex, Nantua, Trévoux—or 35 cantons. Area, 2230 sq. m. Pop. '76, 365,462. Chief t., Bourg.

**AINMÜLLER, MAX. EMAN.**, to whom we owe the restoration of the art of painting on glass, was born at Munich, 1807. He began the study of architecture, but afterwards entered the royal porcelain manufactory as decorator; and it was here that he first succeeded in overcoming the technical difficulties in the execution of glass-painting. A separate institution was now established for the art; and A., as inspector, succeeded in raising it to a high degree of perfection. He is said to have first conceived the happy thought of laying colored glass on colored, instead of the process hitherto followed, of laying colored glass on white; thus giving the command of above 100 variously colored glasses, in all gradations of tint. He was also the first, in conjunction with Wehrstorfer, to execute pictures on glass, and thus revive the art of miniature glass-painting. Nor was it only technical improvements and inventions that he contributed to the new art; his artistic culture qualified him powerfully to aid the regeneration of taste that has accompanied it. The first work of the new institution was the restoration of the windows of the cathedral of Ratisbon (1826-33), to which A. contributed the ornamentation, and painted several of the figures. He made a like contribution to the splendid windows of the church of Maria-Hilf (1833-38), in Munich. In the contribution of king Ludwig of Bavaria to the cathedral of Cologne, and the numerous other windows executed at Munich for all parts of the world—England among the rest—A. displayed the highest artistic faculty in giving to the figures a rich setting of architectural ornamentation, in such a way as to harmonize with the style of the building.—A. also acquired a great reputation as an architectural painter in oil. Among his pieces are St. Mark's church, in Venice; the interior of St. Stephen's church, Vienna; the interior of Windsor chapel, of Westminster abbey, and the poets' corner. He d. Dec., 1870.

**AINOS**: a race of men inhabiting Yezo, Saghalien, and the Kurile islands, numbering in all 20,000. They are of short stature, thick-set, with bushy black hair, beards, and eyebrows. Though living in Japanese territory, they approach the Caucasian type of humanity, having eyes set at right angles to the nose, and speak in a language having no affinity with the Japanese. They have attracted great attention through the many descriptions of them, often fanciful and exaggerated, by writers who call them the "Hairy Kuriles," and as likely to furnish the long-desired evolutionary link between the hair-clad beast and smooth-skinned man. As matter of fact, their bodies are not, as a rule, more hairy than those of men of the Anglo-Saxon race. The A. are fetish-worshippers, and in disposition are mild and tractable. They have no written language, as closet-scholars and many encyclopædias assert. They are probably the aborigines of Japan. The mikado's government is now civilizing them in schools and on farms, and American missionaries have entered among them. See *The Mikado's Empire, Reports of Horace Capron and his Assistants*, Tokio, 1875; *Transactions of the Asiatic Society of Japan*; and *Sunday Magazine*, N. Y., May, 1879.

**AINSWORTH, HENRY**, 1560-1623; an English scholar and divine. Tradition says that he was a Roman Catholic, and his younger brother John a Protestant; that the two entered into a written controversy, reciprocally converted each other, and each embraced the other's religion. Henry was driven from England by proscription and lived in poverty in Amsterdam about 1598. There he became a doctor or teacher in the first church of the sect called Brownists. Though never forward, he was the most steadfast, resolute, and cultured champion of the principles of civil and religious freedom represented by the nonconformists in Great Britain and America. While fighting for freedom from hierarchal tyranny A. pursued his Hebrew studies, and for a long time biographers had two Henry A.'s, one the learned rabbinical student, the other the arch-heretic and leader of the Separatists; but the two were one man. His most notable work is *A Defense of the Holy Scriptures; Worship and Ministry used in the Christian Church separated from Anti-Christ, against the challenges, cavils, and contradictions of M. Smythe*. He wrote notes on all the books of the Pentateuch, the Psalms, and Solomon's Song. There is a story, not probable, that he was poisoned by Jews.

**AINSWORTH, ROBERT**, the author of a once extensively used Latin dictionary, was b. at Woodvale, near Manchester, in 1660. He was educated at Bolton, and taught a school there for some time, but afterwards went to London, where he was engaged for many years in educational pursuits. In 1714 he commenced his dictionary (Latin-English and English-Latin), which, however, was not published until 1736. A. d. near London on the 4th of April, 1743. He wrote also some Latin poems, and a few

treatises on various subjects ; but nothing keeps his memory alive except the dictionary, which itself is now fast passing away into oblivion. The labor expended on such a production was indeed highly honorable to the author, but the work has no claim to the character of an accurate or philosophical lexicon, and, in spite of the numerous emendations it has received, it remains essentially what it was at first. It has been superseded by Riddell's, and more recently by Smith's, Andrews's, and other lexicons.

**AINSWORTH, WILLIAM FRANCIS**, an English physician, geologist and traveler, a relation of the foregoing, was b. at Exeter, 1807. He studied medicine at Edinburgh, and, after receiving (1827) his medical diploma, he travelled in France, and prosecuted geological investigations in the Auvergne and Pyrenean mountains. Returning to Edinburgh in 1828, he conducted the publication of the *Journal of Natural and Geographical Science*, and delivered lectures on geology. In 1835, he was attached as physician and geologist to the Euphrates expedition under col. Chesney, at the recommendation of col. Sabine, and returned home in 1837 through Kurdistan, the Taurus and Asia Minor. In the following year he went again to Asia Minor, being sent with Rassam and Russell by the geographical society and the society for the diffusion of Christian knowledge. The objects were chiefly to explore the course of the Halys, and to visit the Christians in Kurdistan. On his return (1841) he published *Researches in Assyria*. He has published also *The Claims of the Christian Aborigines in the East and Tracks in the Track of the 10,000*. He has edited *Lares and Penates, or Cilicia and its Governors*; *On an Indo-European Telegraph by the Valley of the Tigris*, a project which the Turkish government has since carried out; *All Round the World*; *The Illustrated Universal Gazetteer*, etc. He is a member of many foreign learned societies, and was one of the founders of the West London Hospital.

**AINSWORTH, WILLIAM HARRISON**, a well-known writer of fiction, was b. Feb., 1805, at Manchester, where his father was a solicitor. His creative fancy began early to show itself in ballads and tales, which appeared in the local newspapers, and in contributions to the *London Magazine* and other periodicals. Being destined to succeed his father, he entered a writer's office ; but after a while he forsook law for literature, and at first began a publishing business in London, which, however, he soon gave up in disappointment. He had previously published his first novel, *Sir John Chiverton* (1825). After spending some time on the continent, he returned to England, and wrote *Rookwood* (1834), which was favorably received. It was followed by *Orichton* (1837) and *Jack Sheppard* (1839). A. edited for a time *Bentley's Miscellany*, and in 1842 began his own *Ainsworth's Magazine*. He published the *Lancashire Witches* in 1848 ; six years later appeared the *Star Chamber* ; in 1860 *Oringdean Grange* ; the *Lord Mayor of London* was published in 1862, *Cardinal Pole* the following year, and *John Law, the Projector*, in 1864. His more recent works are the *Spanish Match*, *Constable de Bourbon*, *Old Court*, *Middleton Pomphret*, *Henry St. Ives*, *Merrie England*, and *The Leaguer of Lathom* (1876).

**AIN-TA'B**, a t. of Syria, near the source of the Kowek; an affluent of the Euphrates, 59 m. n.e. from Aleppo. It is tolerably well built: the houses are mostly of stone. It is well supplied with water, pure streams of which flow constantly through the streets. It has a castle built upon a mound, resting on rock, and of very striking appearance. The chief trade is in hides and leather ; but cotton, sheep's and goats' wool, wax, wheat and rice are also of commercial importance, being chief articles of produce in the surrounding district. A. is supposed by some to be the ancient *Antiochia ad Taurum*. Pop. 20,000, composed of Turks, Greeks and Armenians.

**AÏR**, or ASBEN, a kingdom of c. Africa, extending from about 17° to 19° n. lat., and from 8° to 9° e. long. Agades (q.v.) is the capital, and residence of the sultan, but his power is in a large measure merely nominal. The country contains various towns and villages, and is principally inhabited by three large tribes—the Kel-owi, the Kel-geres, and Itisan, each of which has numerous subdivisions. There are, besides, the Kel-n-Negarru, the Imghad, etc. The word *kel* means "people," but specially denotes *settled* people, in opposition to *nomads*. Thus, Kel-owi is people settled in the valley of Owl. Many of the tribes and families live not in fixed dwellings, but movable tents made of mats. The valleys of A. are naturally rich, but they are poorly cultivated. Food and clothing are both imported. The population, which is very considerable, could not be sustained, were it not for the salt-trade of Bilma, a t. lying to the e. of A., in the Tebu country. Although the valleys of A. are in the region of the tropics, the climate is comparatively temperate. See Barth's *Travels in Central Africa*, vol. i.

**AIR** is the name given to that compound of gases constituting the substance of our atmosphere. Formerly, all æriform fluids were called "airs," but in this sense the word *gas* is now used. The chief properties of air, and the phenomena they give rise to, will be found treated under *Atmosphere*, *Aërodynamics*, *Aërostatics*, *Air-Pump*, *Barometer*, *Balloon*, etc.

**AIR**, in Music. See **ARIA**.

**AIRAY, HENRY, D.D.**, 1560–1616; a Puritan preacher, and president of Queen's college, Oxford. When first a student he was poor, and did servile work in the college ; but he rose in station, took orders, and became a frequent and zealous preacher, a

thorough Calvinist and a fiery opponent of Romanism. In 1606 he was vice-chancellor of the university, and was also rector of Otmoor. He was a good specimen of the more cultured Puritans.

**AIR-BEDS and AIR-CUSHIONS.** Air-beds were known as early as the beginning of the 18th c., but being made of leather, were expensive. It was only after the invention of air-tight or Macintosh cloth that it became possible to use air in this way at a moderate cost. An air-bed consists of a sack in the form of a mattress, divided into a number of compartments, each air-tight; a projection at one end forms a bolster. Each compartment has a valve, through which the air is blown in by bellows. The advantages of such beds, in point of cleanness, coolness, lightness and elasticity are obvious. They are specially valuable in many cases of sickness. The *travelling-cushion* is another contrivance of the same kind. Recently, vulcanized India-rubber, instead of cloth, has been used in the fabrication of such articles. The chief drawback to these contrivances is the liability to being spoiled by a rent or other injury.

**AIR-BLADDER, or SWIMMING-BLADDER,** in fishes. An organ apparently intended to aid them in ascending in deep water, and for the accommodation of their specific gravity to various depths. It is made to serve this purpose by the increase or diminution of its volume, according to the degree of pressure exerted upon it by the ribs. Its place is in the abdomen, under the spine; and it is very various in size and form in different kinds of fishes. It generally has an opening into the œsophagus, or into the stomach, but apparently only for the ejection and not for the admission of air. In some fishes it has no opening. The air with which the A. is filled appears to be the result of secretion; and in fresh water fishes consists in general almost entirely of nitrogen, but contains a larger proportion of oxygen in sea-fishes, the oxygen in deep-sea fishes having been found to amount to 87 per cent. The A. is in some fishes very small; in others, it is entirely wanting, particularly in fishes that are destined to live chiefly at the bottom of the water, as flat fishes, eels, etc.; but there are remarkable

Air-bladder of carp: consisting of two parts—B and C, joined by a narrow neck; A D, a canal communicating with œsophagus, E.

instances of its absence also in species of very different habits, such as the common mackerel, whilst it exists in other species of the same genus or family. The A. of fishes affords the finest kind of isinglass.

**AIR-CELLS, or Air-Sacs,** in birds, are remarkable cavities connected with the respiratory system. They are distributed along the inside of the whole cavity of the chest and abdomen; and in birds of strong wing and rapid flight, often send prolongations into the bones. They are connected with the extremely active respiratory system, and communicate with the lungs, giving an immense extension to the surface with which the air inhaled comes in contact.

The cells in the lungs of the mammalia into which the air is conveyed by minute ramifications of the windpipe, in order to be brought into contact with the blood distributed on their walls are very small; in man, only about one hundredth part of an inch in diameter.—Air-cells, or air-sacs, may be said to form the whole respiratory apparatus in some of the lower kinds of animals (see ANNELIDA), whilst in others higher in the scale of organization, particularly in insects, *air-tubes* arising from these ramify throughout the whole body. The air-tubes of insects are formed of a spiral fiber within a membranous coat, like the spiral vessels of plants, so that they possess great elasticity.

Air-tubes of insect.

Lungs, etc., of ostrich: a a a a, air-cells; b b, lungs; c, heart; d, stomach; e, intestines.

**AIR-CELLS** in plants are cavities containing air in the stems or leaves. The orifices of the intercellular passages are closed up, so as to prevent the juices of the plant from entering them. They are very variable in size, figure, and arrangement, but are formed according to a uniform rule in each particular species in which they are found. They are large and numerous in many aquatic plants, evidently serving the purpose of buoying them up in the water. Besides A. of regular form, there are irregular cavities also called by the same name, which seem to be formed by the tearing of the cellular tissue in the rapid growth of the plant, as in grasses and umbelliferous plants.

**AIRD, THOMAS**, a poet of considerable genius, b. at Bowden, in Roxburghshire, in 1802. He received the rudiments of education at schools in his native county, from which he passed to the university of Edinburgh. While in the metropolis he made the friendship of many distinguished men, especially prof. John Wilson, who was accustomed to speak of him in the highest terms. In 1835 he became editor of *The Dumfries Herald*, a new journal, started on conservative principles, an office which he filled till

1864. His genius was of a purely literary character, and not calculated to be effective in the discussion of political questions.\* His works are not so well known as they deserve to be, from their intrinsic merit. In spite of very warm eulogy from some of the greatest names in popular criticism, and in spite of many elaborate and discriminating reviews, in various important magazines, they have failed to secure a large measure of public approbation. *The Devil's Dream* is perhaps an exception to the rest, for it is both well known and admired. Competent judges have asserted that there is something almost Dantesque in the stern, intense and sublime literalness of the conception. Whether the scenes are colossal, as in *The Devil's Dream*, or minute, as in *The Summer's Day*, there is the same clear, vigorous and picturesque word-painting. Herein lies A.'s chief originality, for his thought and sentiment, though always pure and fine, are not strikingly novel. In 1827 he published *Religious Characteristics*, a piece of exalted prose-poetry; in 1845, *The Old Bachelor*, a volume of tales and sketches; in 1848, a collected edition of his poems—a second edition of which appeared in 1856; and in 1852 he edited the select poems of David Macbeth Moir (the "Delta" of *Blackwood*), prefixing a memoir for the benefit of Dr. Moir's family. Without having fully realized the expectations to which his early works gave rise, A. died 25th April, 1876. See *LIFE AND POEMS* edited by J. Wallace (1878).

**AIRDRIE**, a flourishing town in Lanarkshire, 11 m. e. of Glasgow. The high-road between Edinburgh and Glasgow intersecting it forms its principal street. It has risen rapidly, and is now one of the most flourishing inland towns in Scotland. Little more than a century ago it consisted of a solitary farm-house or two, but the abundance of iron and coal in the vicinity has given its progress an impetus like that of an American city (see *GARTSHERRIE*). The Monkland canal and the Caledonian railway receive the produce of the coal-pits and iron-mines. The t. has some neat buildings, is well paved, and lighted with gas. The weaving of cotton goods for the Glasgow manufacturers is carried on to a considerable extent, as is also the distillation of spirits, silk-weaving and paper-making. It unites with Falkirk in sending a member to parliament. Pop. in '71, 15,671.

**AIRE**, or **AIRE-SUR-L'ADOUR**, (anc. *Vicus Julius*), a t. of the dep. of Landes, France, on the left bank of the Adour, 76 m. s. from Bordeaux. It is a bishop's seat; and its cathedral, which has been often destroyed and rebuilt, is one of the most ancient in France. A. has been a place of consequence from the days of the Roman conquest of Gaul, and was the capital of the Visigoths under Alaric, but is now much decayed, and diminishing in population. It has hat manufactories and tanneries. Pop. '72, 2576.

**AIRE**, or **AIRE-SUR-LE-LYS**, a t. of the dep. of Pas-de-Calais, France, on the Lys, 30 m. s.e. from Calais. It is a fortress of the third class; the t. well built, but its situation low and marshy. The barracks are capable of containing 6000 men. There are manufactures of woollen stuffs, linen yarn, thread, hats, starch, Dutch tiles and soap; also some trade in grain. Osier-work is carried on to some extent. Pop. '76, 5058.

**AIR-ENGINE**. See *CALORIC ENGINE*.

**AIR-GUN**, an instrument for firing bullets or other projectiles, by the force of compressed air instead of gunpowder. Various forms of construction have been adopted. The most usual plan is to insert a condensing syringe in the stock of the gun. The piston of this syringe is worked by an apparatus which passes through to the exterior of the gun; and this working causes a small body of air to be condensed into a chamber. The chamber has a valve opening into the barrel, just behind the place where the bullet is lodged. The gun is loaded from the muzzle, as ordinary muskets or fowling-pieces; and there is at that time just behind it a small body of highly compressed air, ready to rush out at any opening. This opportunity is afforded by a movement of the trigger, which opens the valve; the air rushes forth with such impetuosity as to propel the bullet. By a certain management of the trigger, two or three bullets, successively and separately introduced, can be fired off—if firing it can be called—by one mass of condensed air. Another form of A. contains several bullets in a receptacle or channel under the barrel; by the movement of a cock or level, one of these bullets can readily be shifted into the barrel; and thus several successive discharges can be made after one loading—on a principle somewhat analogous to that of the revolving pistol. Some varieties of A. have the condensing syringe detached, by which means a more powerful condensation of air may be produced; this done, the air-chamber is replaced in its proper position behind the bullet in the barrel. Those air-guns which present the external appearance of stout walking-sticks, and are thence called air-canes, have a chamber within the handle for containing condensed air, which can be unscrewed, and subjected to the action of the condensing syringe. One inventor has devised a form of A. with two barrels—one of small bore for the reception of the bullets, and another of larger bore for the reservoir of condensed air; the condensing syringe being within the stock of the gun. An attempt has more recently been made to combine the action of elastic springs with that of compressed air, in an A.; springs of gutta-percha, or of vulcanized india-rubber, are employed in substitution of or in co-operation with a condensing syringe. No form of A. hitherto made has had power enough to propel a bullet to any considerable distance, and therefore the instrument is scarcely available in war; there are, however, circumstances in which such an arm may be useful—seeing that there is no expense for gunpowder, no noise, no

smoke, no unpleasant odor. The A. was known in France more than two centuries ago; but the ancients were acquainted with some kind of apparatus, by which air was made to act upon the shorter arm of a lever, while the larger arm impelled a bullet.

**AIR-PLANTS.** See EPIPHYTES (*ante*).

**AIR-PUMP**, an instrument for removing the air from a vessel. The essential part is a hollow brass or glass cylinder, in which an air-tight piston is made to move up and down by a rod. From the bottom of the cylinder a connecting tube leads to the space which is to be exhausted, which is usually formed by placing a bell-glass, called the receiver, with edges ground smooth and smeared with lard, on a flat, smooth plate or table. When the piston is at the bottom of the barrel, and is then drawn up, it lifts out the air from the barrel, and a portion of the air under the receiver, by its own expansive force, passes through the connecting tube and occupies the space below the piston, which would otherwise be a vacuum. The air in the receiver and barrel is thus *rarefied*. The piston is now forced down and the effect of this is to close a valve placed at the mouth of the connecting tube and opening inwards into the barrel. The air in the barrel is thus cut off from returning into the receiver, and, as it becomes condensed, forces up a valve in the piston, which opens outwards, and thus escapes into the atmosphere. When the piston reaches the bottom and begins to ascend again, this valve closes; and the same process is repeated as at the first ascent. Each stroke thus diminishes the quantity of air in the receiver; but from the nature of the process it is evident that the exhaustion can never be complete. Even theoretically, there must always be a portion left, though that portion may be rendered less than any assignable quantity; and practically the process is limited by the elastic force of the remaining air being no longer sufficient to open the valves. The degree of rarefaction is indicated by a *gauge* on the principle of the barometer. By means of the partial vacuum formed by the A., a great many interesting experiments can be performed, illustrating the effects of atmospheric pressure and other mechanical properties of gases.—The A. was invented by Otto Guericke (q. v.), 1654; and though many improvements and varieties of structure have been since devised, the principle of all is the same. Two barrels are generally used, so as to double the effect of one stroke. In some A., stop-cocks turned by the hand take the place of valves, and in others the entrance of the connecting tube into the cylinder is so contrived that the valve through the piston is not required.

**AIRY**, GEORGE BIDDELL, K.C.B., F.R.S., etc., astronomer royal, was b. at Alnwick in 1801. He was educated principally at Colchester, and passed in 1819 to the university of Cambridge. In 1823 he was elected scholar; in 1823 he took the degree of B.A., with the honor of senior wrangler; and in 1826 that of M.A. In the same year he was elevated to the chair of science founded by Lucas, which he rescued from the reproach of being a sinecure by delivering a course of public lectures on experimental philosophy. In 1828 he was made Plumian prof., and had the management of the newly erected Cambridge observatory intrusted to him. On account of his severe and unintermitting labors in connection with this office, his income was augmented from the funds of the university. He published his observations (*Astronomical Observations*: Cambridge, 1829–38, 9 vols.), arranged in a clear and simple manner, and they have served as a model ever since for those of Greenwich and other observatories. In 1835, the office of astronomer royal becoming vacant, A. was appointed to it by lord Auckland, then first lord of the admiralty. He has introduced new or more perfect scientific instruments, more rapid methods of calculation, and researches in magnetism, meteorology, photography, etc. He contributed the well-known article on "Gravitation" to the *Penny Cyclopædia* (1837). Equally excellent and popular is his treatise on trigonometry, written for the *Encyclopædia Metropolitana* (1853). He has deservedly obtained the reputation of being one of the most able and indefatigable of living *savans*. He served on the royal commission appointed in 1868 to inquire into the standard weights and measures. In 1869 he communicated to the royal astronomical society a remarkable discovery on "Atmospheric Chromatic Dispersion, as affecting Telescopic Observation and the mode of correcting it." He became a companion (civil) of the bath in 1871, and a knight commander in 1872. A. is an F.R.S.; an honorary member of the institution of civil engineers, corresponding member of the French institute, a D.C.L. of Oxford, and LL.D. of Cambridge and Edinburgh.

**AISLE** (from Lat. *ala*, a wing) means any lateral division of any part of a church, whether nave, choir, or transept. The number of aisles varies in the churches of different countries. In England, there is only one on each side of the nave or choir; in most foreign countries, there are generally two, and at Cologne there are even three. The continental edifices, it would seem, have antiquity in their favor for this arrangement (see *BASILICA*). The word is often incorrectly applied to the open space in the nave of churches between the seats of the congregation.

**AISNE**, a tributary of the Oise, in France, rises in the department of Meuse, and flows n.w. through the departments of Marne and Ardennes, and then w. through that of Aisne and part of Oise, where it falls into the river Oise, above Compiègne. Its course extends to 150 m., of which 70 are navigable.

**AISNE**, a department in the n. of France, formed of a part of ancient Picardy and the isle of France. It belongs to the basin of the Seine, and is intersected by the river A., and by other navigable streams and canals. The soil is fertile; the chief culture is wheat and other grain. Its rich meadows supply Paris with hay. The area is 2880 sq.m., with a pop. of (1876) 560,427. It is the seat of considerable cotton and other manufactures, the center of which is St. Quentin (q.v.), and at St. Gobin is the famous manufactory of mirrors. The department is divided into 5 arrondissements and 37 cantons. The chief town is Laon (q.v.).

**AITKIN**, a recently organized co. in e. Minnesota, intersected by Snake river and by the Northern Pacific railroad; 950 sq.m.; pop. '70, 183. The s.w. portion is occupied by about one half of the lake of a Thousand Islands.

**AITON**, WILLIAM, 1731-93; a Scotch botanist. He was trained as a gardener, and in 1754 became assistant to Philip Miller, superintendent of the garden at Chelsea. In 1759 he was made director of the botanical garden at Kew, and held the place until his death. His skill and care were of great service to this important scientific establishment. In 1789 he published his *Hortus Kewensis*, a catalogue of the plants in the great garden, with plates. This was re-edited by his son and successor in office.

**AITZEMA**, LIEUWE VAN, a Dutch author whose *History of the Netherlands* from 1621 to 1668 is valuable for original documents. He was an active politician, and agent of the Hanse towns at the Hague.

**AIX**, a t. in France, formerly the capital of Provence, now the chief t. of an arrondissement in the department of the Bouches-du-Rhône. It is believed to have been built by the Roman consul, C. Sextius (120 B.C.), on account of the mineral springs in the neighborhood, and thence called *Aque Sextiæ*. A. is the seat of a court of appeals; and possesses an academy for theology and law, and a public library which reckons nearly 100,000 vols. and 1100 MSS. The baptistery of the cathedral is believed to have been originally a temple of Apollo. The numerous public fountains give a cheerful air to the place. One of them has a sculpture of the good king René, executed by David. There is also an old clock-tower, the machinery of which, when the clock strikes, sets various quaint-looking figures in motion. The industry of this again flourishing town consists chiefly in the cultivation of the olive, in cotton-spinning, leather-dressing, and trade in oil, wine, almonds, etc. The warm springs are slightly sulphurous, with a temperature from 90° to 100° F., clear and transparent as the purest well-water, almost free from smell, yet with a slightly bitter taste. They have the reputation of improving the beauty of the skin, and are on this account especially frequented by the fair sex. The field on which Marius defeated the Teutones lies in the plain between A. and Arles. In the middle ages, under the counts of Provence (see *RÉNÉ*), A. was long the literary capital of southern Europe. The pop. of Aix in '76 was 23,407.

**AIX** (*Aqua Gratiæ*, *Allobrogum*), a small town of Savoy, pop. 2000 to 3000, in a delightful valley near lake Bourget, 7 m. n. from Chambéry. It was a much frequented bathing-place in the times of the Roman empire, and among its numerous remains of ancient times are the arch of Pomponius, the ruins of a temple and of a vaporarium. The king of Sardinia has a palace here. The hot springs, two in number, are of sulphurous quality, and of a temperature above 100° F. They are used both for drinking and as baths, and attract annually above 2000 visitors.

**AIX-LA-CHAPELLE** (Ger. Aachen) is the capital of a district in Rhenish Prussia. It is situated in a fertile hollow, surrounded by heights, and watered by the Wurm; n. lat. 50° 47', e. long. 6° 5'; pop. '75, 79,606, of whom a very small proportion are Protestants. A. is the center of numerous thriving manufactories, especially for spinning and weaving woolen fabrics, and for needle and pin-making. There are also immense manufactures of machinery, bells, glass buttons, chemicals, cigars, etc. As a principal station on the Belgian-Rhenish railways, A. is an important staple place of Prussian trade. The city is rich in historical associations. It emerges from historical obscurity about the time of Pepin, and Charlemagne founded its world-wide celebrity. Whether it was the birthplace of Charlemagne is doubtful, but it became his grave 814 A.D. In 796 A.D., Charlemagne caused the already existing palace, called the imperial palace, to be entirely rebuilt, as well as the chapel, in which Pepin had celebrated Christmas in 765 A.D. The two buildings were connected by a colonnade, which fell into ruins a short time before the emperor's death, probably from the effects of an earthquake. The present town-house has been built on the ruins of the palace; the chapel, after being destroyed by the Normans, was rebuilt on the ancient plan by Otho III., in 983, and forms the nucleus of the present cathedral. This ancient cathedral is in the form of an octagon, which, with various additions round it, forms, on the outside, a sixteen-sided figure. In the middle of the octagon, a stone, with the inscription "CAROLO MAGNO," marks the grave of Charlemagne. Otto III. opened the vault in the year 997 A.D. The body of the emperor was found in a wonderful state of preservation, seated upon a marble chair, dressed in his robes, his scepter in his hand, the gospel on his knee, a piece of the holy cross on his head, and a pilgrim's scrip attached to his girdle. Otto caused the tomb to be built up again, after repairing the injuries of the arch. In 1165 A.D., when the emperor Frederick I. caused the vault to be re-opened, the bones of the great emperor

were enshrined in a casket of gold and silver, and a large and beautifully wrought chandelier was hung up over the tomb as a memorial. In 1215 A.D., Frederick II. caused the remains of the emperor to be inclosed in a costly chest, in which they are yet kept in the sacristy. The marble chair was, in later times, overlaid with gold plates, and used till 1558 A.D. at the imperial coronations, as a throne for the newly crowned emperor. The imperial insignia were removed to Vienna in 1795.—In the 14th c., a choir in the Gothic style was added to the east side of the octagon, which had been built in the Byzantine style; while on the west side a square belfry was joined to it, as well as two small round towers, with winding stairs leading to the treasury. Here are kept the so-called "great relics," which, once in seven years, are still shown to the people, in the month of July, from the gallery of the tower. This spectacle attracts many thousands of strangers to A. Much has of late years been done to restore this venerable pile. The columns brought by Charlemagne from the palace of the Exarch at Ravenna, to decorate the interior of the octagon, had been carried off by the French; and although part of them had been restored at the peace of Paris, they were not replaced in the building till recently.

The town-house—which incloses the remains of the imperial palace—adorns the market-place, having the bell or market tower on the left, and on the right the Granus tower, a memorial of old Roman times. The coronation hall, 163 ft. long, by 69 ft. wide, in the interior of the town-house, was, in the last century, divided in the middle by a wooden partition. This noble hall, in which thirty-five German emperors and fourteen empresses have been crowned, has been restored to its original form, and the walls have been lately decorated with large fresco-paintings of scenes from the life of Charlemagne, by Rethel. Before the town-house stands a beautiful fountain, with a bronze statue of Charlemagne. In the church of the Franciscans are to be seen a fine picture of the taking down of Christ from the cross, by Vandyck, and two other pictures representing the crucifixion, by A. Diepenbeek. At a short distance from A., and surrounded by the river, stands Frankenburg, once the favorite residence of Charlemagne and of Fastrada, and still rich in legends. It has been rebuilt from its romantic ruins. As at A. has recently been much improved. It now possesses many fine buildings, among which are several large and splendid hotels. From being a quiet old city of historical interest, it has become a busy center of manufacturing industry. In 1870, a new polytechnic school was erected. A. was formerly noted for its gambling-tables; but these are now disallowed.

The name of Aix or Aachen is evidently derived from the springs, for which the place has been always famous (see Aa.). The name Aquis Granum, which it received about the 3d c., may possibly be derived from Granus, one of the names of Apollo, who was worshiped by the Romans near springs. The French name, A., refers to the chapel of the palace. Charlemagne granted extraordinary privileges to this city. The citizens were exempted, in all parts of the empire, from personal and military service, from imprisonment, and from all taxes. The city also possessed the right of sanctuary: "the air of A. made all free, even outlaws." In the middle ages this free imperial city (then included in the circle of Westphalia) contained more than 100,000 inhabitants, and held an important place among the confederated cities of the Rhine. The emperors were crowned in A. from Louis the Pious to Ferdinand I. (813-1531 A.D.); 17 imperial diets and 11 provincial councils were held within its walls. The removal of the coronations to Frankfort, the religious contests of the 16th and 17th c., a great fire which in 1656 A.D. consumed about 4000 houses in the city, combined with other causes to bring into decay this once flourishing community. In Jan., 1793, and again in 1794, A. was occupied by the French. By the treaties concluded at Campo Formio and Lunéville, it was formally ceded to France, and became the capital of the department of Roer; at length, in 1815, the city fell to Prussia. See Quix, *Geschichte der Stadt A.* (History of A.), 2 vols., A., 1841.

The MINERAL SPRINGS of A., of which six are hot, and two cold, were known in the time of Charlemagne, and were much frequented as early as 1170. The hot springs are strongly sulphurous, and contain also hydrochlorates. The temperature varies from 111° to 136° F. They chiefly act on the liver and on the mucous surfaces and skin, and are therefore efficacious in cases of gout, rheumatism, cutaneous diseases, etc. The most remarkable is the "emperor's spring," which rises in the middle of the hôtel Kaiserbad. The baths themselves are from 4 to 5 ft. deep, and are built quite in the old Roman style. The cold springs are chalybeate and not so copious. The new "Eisenquelle" (iron spring), first discovered in 1829, is provided with an elegant bath-house. The well-proved medicinal virtues of the mineral springs of A. bring yearly to the city many thousands of strangers.

TREATIES OF PEACE, and CONGRESS OF A.—The first peace of A. ended the war carried on between France and Spain for the possession of the Spanish Netherlands. On the death of Philip IV., Louis XIV. laid claim to a large portion of those territories in the name of his wife, Maria Theresa, the daughter of Philip, urging the law of succession prevailing in Brabant and Namur respecting private property. The victorious progress of Louis was checked by the triple alliance between England, Holland, and Sweden, and a treaty of peace was concluded at A. in 1668, by which France retained possession of the fortresses of Charleroi, Lille, etc., which she had already taken.

The second peace of A. concluded the war respecting the succession of Maria Theresa

to the empire. See SUCCESSION, WARS OF. After the war had been carried on with various success for eight years, peace was concluded in 1748. In general the possessions of the several states remained as before the war. Austria ceded Parma and Placentia to the Spanish infanta, Philip; and the possession of Silesia was guaranteed to Prussia. The privilege of the Assiento treaty (q.v.) was anew confirmed to England for four years, and the pretender was expelled from France. Owing chiefly to the exertions of her minister, Kaunitz, Austria came off with but small sacrifice, while England, notwithstanding her splendid victories, derived little solid advantage, and was left with a debt raised to 80 millions.

The congress of A. was held in 1818, for regulating the affairs of Europe after the war. It began on the 30th Sept. and ended on the 21st Nov. Its principal object was the withdrawal from France of the army of occupation, 150,000 strong, as well as the receiving of France again into the alliance of the great powers. The emperors of Russia and Austria and the king of Prussia were personally present. The plenipotentiaries were Metternich, Castlereagh, and Wellington, Hardenberg and Bernstorff, Nesselrode, and Capo d'Istria, with Richelieu on the part of France. France having engaged to complete the payment of the stipulated sums of money, was admitted to take part in the deliberations, and the five great powers assembled signed a protocol announcing a policy known as that of the "holy alliance" (q.v.).

**AIZA'NI**, or **AZANI**, a city in Phrygia, mentioned by Strabo. In 1824 its remains were found by the earl of Ashburnham about 30 m. s.w. of Kutaieh. There was a temple of Jupiter, a theater, a stadium, and gymnasium; the theater is in good preservation—its long diameter 185 ft.; it had 15 rows of marble seats. The Rhyndacus (now Adranus) rises near the site of A. and passes through it; it was crossed by two white marble bridges, each of five semicircular arches. Tombs, Roman coins, and inscriptions have been found.

**AJACCIO**, the chief t. of the island of Corsica, which forms a department of France. Pop. in '72, 13,590. The chief employments are the anchovy and pearl fisheries, and the trade in wine and olive-oil, which the neighborhood produces in abundance, and of good quality. The harbor is protected by a strong fort. A. is remarkable as the birthplace of Napoleon; the house is still to be seen.

**AJ'ALON**, a town in ancient Palestine, 14 m. n.e. of Jerusalem, in the tribe of Dan, also spoken of as belonging to Ephraim, Benjamin, and Judah. It is noticeable only as the recorded place where Joshua commanded the moon to stay its course till he had finished his battle. The modern town is Yalo.

**AJAN**, a portion of the e. coast of Africa, extending from Cape Guardafui nearly to the equator.

**AJAX** was the name of two of the Greek heroes of the Trojan war. One of them was called A. the less, or the Locrian, being the son of Oileus, king of the Locrians. At the head of 40 Locrian ships he sailed against Troy, and was one of the bravest of the Greek heroes; in swiftness of foot he excelled all except Achilles. When Cassandra fled to the temple of Minerva, after the taking of Troy, it is said that A. tore her from it by force, and dragged her away captive. Others make him even violate the prophetess in the temple. Though he exculpated himself by an oath when accused of this crime by Ulysses, yet he did not escape the vengeance of the goddess, who caused him to be engulfed in the waves.

The other A., called by the Greeks the greater, was the son of Telamon, king of Salamis, and, by his mother's side, a grandson of Æacus. He sailed against Troy with 12 ships, and is represented by Homer as, next to Achilles, the bravest and handsomest of the Greeks. After the death of Achilles, A. and Ulysses contended for the arms of the hero, and the prize was adjudged to Ulysses, which threw A. into such a state of rage and despair that he killed himself with his sword. This melancholy fate of the hero is the subject of one of the extant tragedies of Sophocles.

**AJEHO'**, or **ASHEHOH**, also called **ALCHUKU**, a city of Manchuria in the Chinese empire; 30 m. s. of Soongaree and 120 m. n. of Kirin. A. is in a fertile region, abounding in grain. The people of the district are exclusively Chinese immigrants, who get the soil at a nominal price on agreeing to reclaim and cultivate it. Pop. about 40,000, of whom a considerable number are Mohammedans.

**AJMEER**, one of the districts of Hindostan, directly under the government of India, lying between lat. 25° 43' and 26° 42', long. 74° 22' and 75° 33'. Its length from s.e. to n.w. is about 80 m.; breadth, 50; area, 2,661 sq.m. The surface of the country towards the s.e. is generally level. In the n., n.w., and w. it is broken by mountains and hills belonging to the Aravalli range. The mountain of Taraguri, above the city of Ajmeer, contains carbonate of lead, manganese, copper, and abundance of iron ore. The general elevation of the plain of A. is about 2000 ft., and the frosts in winter are sometimes severe. Strong breezes are prevalent, and the climate on the whole is healthy. The scarcity of water, however, often occasions great distress. The only permanent stream is the Korce, the water of which is so impregnated with mineral salts as to be unfit for alimentary use except during the rains. To compensate for this deficiency, water-tanks are numerous. The staple crop is bajra (*holcus spicatus*). Sheep are reared in great numbers, and wool is cheap, affording the material of their clothing to the lower orders. Among the more

prevalent diseases are small-pox and ophthalmia. The pop. in '72 was 316,032, of whom about 40,000 were Mussulmans, etc., the rest Hindoos. The principal race are the Rajpoots, the conquerors of the native Bheels, Mhairs, and Neenas. The present limits of this district by no means correspond to its former importance. In the 12th c., at the time of the Mussulman invasion, the sultan of A. and Delhi was the most powerful monarch in India. Under Akbar also, who acquired this territory in 1559, A. was a large and important province. It afterwards fell into the hands of the Mahrattas, from whom it was wrested by the British in 1817.

**AJMEER**, an ancient city of Hindostan, the capital of the British district of the same name, 228 m. w. from Agra. It is situated in a picturesque and rocky valley, at the foot of the mountain of Taragurh, which is crowned by a fort, once strong, but now dismantled. The city is surrounded by a stone wall, with five lofty and handsome gateways on the w. and n. Most of the streets are narrow and dirty, but some of them are spacious, and contain many fine residences, besides several mosques and temples of very massive architecture. A. is the seat of the British political agency, a medical school, and an English and oriental school. The tomb of the Mussulman saint, Kwajah, within the town, is held in great veneration, and pilgrimages are made to it even by Hindoos. The emperor Akbar journeyed to it from Agra on foot in 1570, in fulfillment of a vow after the visit of his son Jehanghir. In Oct., a great annual fair is held in honor of the saint, at which ridiculous miracles are pretended to be wrought. The pop. of A. in '71 was 34,763.

**AJURUOCA**, town of the province of Minas Geraes, Brazil, 100 m. n.w. from Rio de Janeiro. It is situated in a fertile country, at the northern base of the Sierra Mantiqueira, on the river Ajuruoca, one of the head-waters of the Parana. The surrounding district once yielded much gold, which has apparently been exhausted; but it produces excellent crops of tobacco, millet, mandioc, sugar and coffee. Swine are reared for the market of Rio de Janeiro. Pop. (including district) about 12,000.

**AK'ABAH**, a village near the gulf of A., on the e. arm of the Red sea, supposed to occupy the site of the Elath of scripture. Ruins in the sea a short distance to the s. still bear the name Ezion-geber. In remote ages A. enjoyed a large trade.

**AK'ABAH, GULF OF**, the Sinus Ælaniticus of antiquity; the eastern of the two divisions of the n. end of the Red sea, running into Arabia Petraea about 100 m. n.e., with a width of 12 to 17 m. Navigation is difficult on account of reefs and sudden squalls. The only good harbor is Golden Port, on the w. shore, 33 m. from the entrance and 29 m. e. of Mt. Sinai.

**AKBAR** (i.e., "very great"), properly JELAL-ED-DIN-MOHAMMED, emperor of Hindostan, the greatest Asiatic monarch of modern times. His father, Humayun, was deprived of the throne by usurpers, and had to retire for refuge into Persia; and it was on the way thither, in the town of Amerkote, that A. was b., in 1542 A.D. Humayun recovered the throne of Delhi after an exile of 12 years; but d. within a year. The young prince at first committed the administration to a regent-minister; but finding his authority degenerating into tyranny, he, by a bold stroke, shook it off, and took the power into his own hands (1558). At this time, only a few of the many provinces once subdued by the Mongol invaders were actually subject to the throne of Delhi; in 10 or 12 years, A.'s empire embraced the whole of Hindostan s. of the Deccan; but although great in subduing, A. was yet greater in ruling. The wisdom, vigor, and humanity with which he organized and administered his vast dominions, are unexampled in the e. He promoted commerce by constructing roads, establishing a uniform system of weights and measures, and a vigorous police. He exercised the utmost vigilance over his viceroys of provinces and other officers, to see that no extortion was practiced, and that justice was impartially administered to all classes of his subjects. For the adjustment of taxation, the lands were accurately measured, and the statistics taken, not only of the pop., but of the resources of each province. For a Mohammedan, the tolerance with which he treated other religions was wonderful. He was fond of inquiries as to religious beliefs; and Portuguese missionaries from Goa were sent at his request to give him an account of the Christian faith. He even attempted to promulgate a new religion of his own; which, however, never took root. Literature received the greatest encouragement. Schools were established for the education both of Hindoos and Mohammedans; and numbers of Hindoo works were translated from Sanscrit into Persian. Abu-l-Fazl, the able minister of A., has left a valuable history of his master's reign, entitled *A-nameh* (history of A.); the third volume, containing a description of A.'s empire, derived from the statistical inquiries above mentioned, and entitled *Ayin-i-Akbari* (institutes of A.), has been translated into English by Gladwin (3 vols., Calcutta, 1786; and London, 1800). A.'s latter days were embittered by the death of two of his sons from dissipation, and the rebellious conduct of the third, Selim (known as Jehanghir), who succeeded his father at his death in 1605.

**AKBARPUE**, a t. of India, in the British district of Cawnpore, 28 m. w. from Cawnpore, on the route from Cawnpore to Etawa. It is the capital of a pergunnah of the same name. Pop. 6330.

**AKEE'** (*Cupania* or *blighia sapida*), a fruit-tree belonging to the natural order *sapindaceæ* (q.v.), a native of Guinea, introduced into Jamaica in the end of last century. It grows to the height of 20 to 25 ft. or upwards, with numerous branches and alternate pinnate leaves, resembling those of the ash. The flowers are small, white, on axillary racemes, the fruit is about the size of a goose's egg, with three cells and three seeds, and its succulent aril has a grateful subacid flavor. The fruit is little inferior to a nectarine. Boiled down with sugar and cinnamon it is used as a remedy for diarrhea. The distilled water of the flowers is used by negro women as a cosmetic. The A. sometimes produces fruit in stoves in Britain. In order to obtain this, the roots should be cramped in pots. —The AKI of New Zealand is a totally different plant, *metrosideros burijolia*, of the natural order *myrtaceæ*, a shrub, which sends out lateral roots, and so attains the summits of the loftiest trees.

**A KEMPIS, THOMAS.** See KEMPIS, THOMAS A.

**A'KENSIDE, MARK**, an author of considerable celebrity, in his own day, on account of his didactic poem, *The Pleasures of the Imagination*, and some medical works. He was b. Nov. 9, 1721, at Newcastle-on-Tyne, where his father was a butcher. Being intended for the Presbyterian church, he was sent to study theology at Edinburgh, but soon abandoned it for that of medicine. He graduated as a physician at Leyden in 1744, and practiced at Northampton, then at Hampstead, and finally in London. His success as a practicing physician was never very great, owing, it is said, to his haughty and pedantic manner. He d. in London (June 23, 1770), soon after being appointed one of the physicians to the queen. At Leyden he had formed an intimacy with Jeremiah Dyson, and this rich and generous friend allowed him £300 a year. Some of his medical treatises, as those on the lymphatic vessels and on dysentery, possess considerable merit. His later poetry, consisting chiefly of odes and hymns, did not attain the same reputation as his *Pleasures of the Imagination*, which was written in his twenty-third year, and to which is owing whatever celebrity has attached to his name. Dyson published his poetic works in 1772, and another edition appeared in 1807. In *Peregrine Pickle*, Smollett has satirically sketched the character of A. under that of the pedant who undertakes to give an entertainment after the manner of the ancients. A. has little originality of conception, or even of expression; the reader is carried along for a time by the evident enthusiasm of the poet, and rapid and stately march of lofty images and ideas; but, as it has been well expressed, "all is operose, cumbrous, and cloudy, with abundance of gay coloring and well-sounding words, but filling the eye oftener than the imagination, and the ear oftener than either." A. became dissatisfied with his juvenile production, and at his death had written a portion of a new poem on the same subject. Both poems were published in the complete edition of his works, Lond., 1773. His life has been written by Bucke: *Life, Writings, and Genius of A.* (Svo, Lond., 1832).

**A'KERBLAD, JAN DAVID, 1760-1819**; a Swedish archaeologist, learned in Runic, Coptic, ancient Egyptian and Phœnician literature. He was secretary of the Swedish embassy to Constantinople, whence he went to Jerusalem and the Troad in 1792-97. He was also ambassador at Paris. His last years were spent in Rome, where he was sustained by a pension from the duke of Devonshire.

**AKERS, BENJAMIN PAUL, 1825-61**; an American sculptor. He began life as a printer, but in 1849 opened a studio in Portland, Me., and made busts of Longfellow and others. In 1851-53 he went to Italy, and on his return made a statue of "Benjamin in Egypt," which was exhibited in the New York crystal palace in 1853. He went to Rome in 1855, remaining three years, producing "Una and the Lion," a statue of "St. Elizabeth of Hungary," the "Dead Pearl Diver," and an ideal head of Milton, which last two are described in Hawthorne's *Marble Faun*.

**AKETON**, another name for a portion of armor used in the feudal times, called the Gambeson (q.v.).

**AKHALZIKH'**, or AKISKA, a t. of Russian Armenia, 90 m. w. from Tiflis, on the left bank of the Dalka, an affluent of the Kur. It is situated in a valley of the Keldir mountains, and at such an elevation above the sea that the winter is severe, although the summer is very hot. A. was anciently called Keldir or Chaldir. It is without walls, but has a strong citadel, built on a rock. The mosque of Sultan Ahmed, built on the model of St. Sophia, in Constantinople, has a library attached to it which was accounted one of the most valuable in the east, but the Russians, after acquiring possession of A., carried off great part of its most valuable treasures to St. Petersburg. Maize, wheat, barley, flax, cotton, silk, grapes, figs, and honey are produced in the surrounding district. Some manufactures are carried on in the town, and it maintains an active trade with various places on the Black sea. Pop. '67, 15,977, two thirds of whom are Armenians.

**AK-HISSAR'** (anc. *Thyatira*), a town of Asia Minor, in Anatolia, 52 m. n.e. from Smyrna, on somewhat elevated ground in the valley of the Hyllus. The streets are paved with carved stone, and other relics of antiquity abound; but there are no ruins of ancient buildings. Cotton goods are exported. Pop. estimated at 10,000, of whom two thirds are Turks and the remainder mostly Greeks.

**AKHLAT'**, or **ARDISH**, a t. of Asiatic Turkey, in the vilayet of Van, and 58 m. n.w. from Van. It is situated on the n.w. shore of lake Van, and is surrounded by a double wall and moat, and further protected by towers and a citadel. Pop. estimated at 6000. The old city of A., at a little distance from the present t., in a ravine, was the residence of the kings of Armenia, and was the scene of many conflicts between the Greeks, Armenians, and Persians. It was taken and devastated in 1228 by Jelal-ud-deen, and completely destroyed by an earthquake in 1246.

**AKHOOND OF SWAT**, **THE**, a Mohammedan saint (d. 1878), who exercised great influence and had almost unquestioned authority over Mohammedans in the east, reigning supreme as the guide and director of the hearts of men all over high Asia. His residence was the resort of pilgrims, who came as many as 300 in a day, from Bengal, Bokhara, Constantinople, Persia, Tunis, and even Mecca, to consult him on questions of every kind. For half a century the English E. India government was assiduously watching this man, who possessed a power which no other person in Asia could pretend to wield; but the A. generally kept on friendly terms with the English. In 1877, the Ameer of Afghanistan sought his advice in regard to the proper course in the Russo-Turkish war.

**AKHTYRKA**, a t. of European Russia, in the government of Kharkov, and 58 m. n.w. from Kharkov. It is situated on a small river of the same name, an affluent of the Dnieper. It was founded by the Poles in 1641. It has manufactures of light textile fabrics, and a great annual fair. The neighborhood is very fertile. Pop. '67, 17,411.

**AKTIBA, BEN JOSEPH**, a famous rabbi and teacher of a large school at Jaffa in the 1st or 2d c., said to have had at one time 24,000 pupils. He was in the great Jewish revolt against Rome, taking the side of Bar-Cochba, or Bar-Cochebas, the pretended Messiah, and acted as his sword-bearer. He was taken prisoner by the Romans, and it is said that he was flayed alive, but bore his pains with wonderful fortitude. He is reported to have been 120 years old at death. Jews were long accustomed to visit his tomb, and his is one of the names of ten martyrs still found in a Hebrew penitential prayer. The traditions concerning him are numerous; and many unfounded statements have been made, one of which even identifies him with Bar-Cochba.

**AKTJERMANN**, or **AKKERMANN**, a t. of Russia, in Bessarabia, on the Black sea, at the mouth of the Dniester, with a citadel and harbor; pop. '67, 29,309. It is the Alba Julia of the Romans, and called, by the Poles, Bialogrod, which, as well as A., signifies *the white town*. It is of some importance on account of its harbor, fortifications, commerce, and especially its extensive salt-pits.

The treaty (supplementary of that of Bucharest, 1812) concluded at A. in 1826, between Russia and Turkey, secured to Russia the free navigation of the Black sea, and indemnification for losses sustained by her subjects from the Barbary corsairs; the institution of divans in Moldavia and Wallachia, and the power of re-electing the hospodars after their term of office; and the restoration of the privileges of Servia, in which Turkish troops were only to retain possession of the fortresses. The boundaries in Asia were to remain as they then stood; Russia consequently retaining the Turkish fortresses of which she had gained possession. The non-fulfillment of this treaty on the part of the Porte occasioned the war of 1829, which was terminated by the peace of Adrianople.

**AKMOLINSK**, a province of Siberia, organized 1863. It is composed of three of the five districts into which the Siberian Kirghiz was formerly divided, with part of the domain of the Siberian Cossacks, and the t. of Omsk and Petropaulovsk. Capital, A., 300 m. s.w. of Omsk. Pop. of province, '67, 4800.

**AKOLA**, a t. in India, on the Nagpur extension of the great Indian Peninsular railway, in 26° n. and 76° 2' e.; pop., '69, 12,236. There are in the t. some rich merchants, and two markets are held each week. Besides the ordinary public buildings there is one English church. A. is the headquarters of the district of the same name.

**AKRON**, a t. of the state of Ohio, N. America, the capital of Summit co. It is situated 36 m. s. of Cleveland, on the Little Cuyahoga, which falls into lake Erie, and at the junction of the Ohio and Erie canal with the Pennsylvania and Ohio canal, at the highest point in the course of the former canal, whence its name (Gr., a summit). It is also on the Cleveland and Zanesville railway. It was first settled in 1825. It has woolen factories, flour-mills, a steam-engine factory, a stove factory etc. The machinery of all its public works is driven by water-power. It is a place of considerable trade. Pop. '80, 16,462.

**AK-SHEHR** (*white city*, anc. *Philomelion*), a city of Asiatic Turkey, in the pashalic of Karaman, five m. s. of the salt lake of Ak-shehr, at the entrance of an extensive mountain valley. The houses rise in successive terraces on the slope of a hill. There is here a celebrated carpet manufactory. Pop. estimated at 6000.

**AK-SU**, a t. of eastern Turkestan, 260 m. n.e. from Yarkand, on an affluent of the Tarim, and on the southern base of the Thian-shan mountains. It was formerly the residence of the kings of Kashgar and Yarkand. While eastern Turkestan formed part of the Chinese empire it was an important garrison t. In 1867 it was captured by the Atalik-Ghazee. In 1716 it was nearly destroyed by an earthquake, and in the beginning of the present century suffered terribly from an inundation. It is celebrated for its manu-

factures of cotton cloth and saddlery. It is much resorted to by caravans as an entrepôt of commerce between Russia, Tartary, and China. The pop. is very variously estimated from 6000 to 20,000 and upwards. Sheep and cattle are extensively reared in the neighborhood. See TURKESTAN, EASTERN.

**AKYAB**, a t. of Further India, the chief sea-port of the district of A. or Aracan proper, and the capital of the province of Aracan. It was formerly called Twet-twe, and sometimes still receives that name. It is situated on the eastern side of the island of A., at the mouth of the Kuladyne or Coladyne. The houses are well built, the streets broad and regular. The t. is rapidly rising in commercial importance. Light-houses have been erected for the benefit of the harbor. Pop. '72, 19,280.

**AL, IL, or UL**, the only article in the Arabic language. When before a lingual or dental the sound of the *l* is dropped, the following letter taking a double force, as "Il shams" (the sun), pronounced "ish shams." When the word preceding the article ends with a long vowel, the *a* in A. is dropped and the *l* joined to the vowel sound: Example, "Abu il Feda," pronounced "Abulfeda."

**ALABAMA**, one of the states composing the Union of N. America, was first known to Europeans in the year 1541, half a century after the discovery of America. The celebrated exploring expedition of De Soto had to fight its way fiercely through the tribes who peopled its wilds at that period, and who were much less savage and far more numerous than the northern aborigines. In one instance, a chief's house measured 120 ft. by 40, and included small buildings like offices. Upon the Savannah river, at Silver Bluff, there was found a remarkable temple, 100 ft. long, 40 ft. wide, and proportionably high. In the beginning of the 18th c. the French built a fort on Mobile bay, but the city of that name was not commenced till nine years later (1711). In 1763, when the entire French possessions e. of the Mississippi (except New Orleans) fell into the hands of the English, A. was incorporated first with Georgia, afterwards, in 1802, with the Mississippi territory; but finally, in the year 1819, it became an independent member of the great American confederacy, and is now the fourth in point of population among the southern states.

A. very nearly forms a rectangle, widening a little towards the s.e. and s.w., so that we would naturally expect a fine sea-board; but of this it is deprived by Florida, which occupies fully three fourths of the coast-line. It lies between 30° 10' and 35° n. lat., and between 85° and 88° 30' w. long.; being about 330 m. in extreme length from n. to s., and 300 m. in breadth. It contains an area of 50,722 sq.m., or 32,462,080 acres, only 5,062,204 of which, or rather less than one sixth, were improved in 1870. The country is neither mountainous nor level, but rugged and broken, especially in the center, with many picturesque views and wild romantic gorges. The Alleghanies terminate in the n. in a series of elevated hills, and the ground gradually slopes to within 60 m. of the gulf of Mexico, when it becomes level. There are three bays in A., the principal of which is Mobile bay, stretching n. for about 30 m. There are also three large rivers—the Tennessee, the Tombigbee, and the A.; the first of which only makes a sweep into the state at the n.e. angle, and then another sweep out at the n.w.; the second comes into A. from Mississippi, receives an affluent, Black Warrior, and flows due s. until it is joined by the A., flowing out of Georgia in a s.w. direction. After the union, the river is called the Mobile, and discharges its waters into the gulf of Mexico. The Tombigbee is about 500 m. in length and navigable for steamboats throughout its entire course in A. The A. is about 600 m. long, and may be ascended in steamboats to Wetumpka, on the Coosa branch, 460 m. from the gulf; but the navigation of the Tennessee, which has 130 m. of its course in A., is obstructed by the muscle-shoals, a series of rapids. The climate of this state is almost tropical, as it reaches to within 7° of the torrid zone, and its productions are allied to those of the tropics. Rivers rarely freeze. In 1850–1851, the maximum temperature of the three winter months was ascertained to be 82°, the minimum, 18°, and the mean at 3 o'clock p.m., 48.25°. The lowlands are very unhealthy near the rivers and muscle-shoals, but the hilly regions are salubrious. The soil is exuberantly fertile, yielding more cotton in 1870 than any other state except Mississippi and Georgia. There are fine grazing-lands in the low hills of the n., where the Alleghanies terminate, and the long flat valleys between them are extremely rich. The central part is a great, broken, and swelling prairie, remarkably fertile; while the southern, though often sandy and inferior in productiveness, has many fertile alluvial bottoms, which yield rice. Besides cotton, A. produces large quantities of Indian-corn, oats, sweet potatoes, and butter; a considerable amount of wheat, rye, rice, wool, hay, pease, beans, potatoes, fruits, market-vegetables, and sugar; some tobacco, barley, buckwheat, wine, cheese, grass-seeds, hops, flax, and silk are also raised. In 1870, 14,961,178 acres of land in A. were in farms, averaging 222 acres in size, with a live-stock valued at \$26,690,095, and products worth \$67,522,335. There is abundance of wild deer and turkeys; and wild geese and ducks frequent the muscle-shoals of the Tennessee in immense numbers. Bears, wolves, and foxes are likewise still met with. The trees, like the animals, are numerous, but not remarkably varied. In the center and n., there are oaks, poplar, hickory, chestnut, and mulberry; in the s., cypress and loblolly; pine is also abundant s. of the mountains. A. is, however, very rich in mineral treasures, particularly in coal, iron, limestone, and marble. Red ochre, lead,

and manganese are also found. A vein of bituminous coal of a superior quality runs eastward from Tuscaloosa into Georgia. There are, in various sections of the state, salt, sulphur, and chalybeate springs. At Blount's springs, a fashionable watering-place, there are several different varieties of sulphur waters. A gold mine was also wrought, for a short time in St. Clair co., while the statuary granite of A. is admitted to be the best in the whole of the United States.

The state receipts for the year ending Sept., 1818, were \$718,238; the state debt in that year, \$9,452,669. In 1870 there were in the state 2188 manufacturing establishments, which produced goods to the value of \$13,040,644. The most important manufactures were those of flouring-mill products and cotton goods: 102 establishments, producing goods worth \$1,670,332, being engaged in the former; and 13 establishments, with products valued at \$1,088,767, in the latter. Among the other manufactures are machinery, iron, sawed lumber, carriages, and wagons, besides the "neighborhood industries" of boot and shoe making, blacksmith's work, carpentering, etc.

In 1875 there were in A. 1856 m. of railroad completed, and several hundreds in course of construction. The commerce of A is very extensive; for the steamboat navigation on her rivers, 1500 m. in all, affords an outlet not only for her own productions, but also for those of Mississippi and Georgia.

Education is progressing satisfactorily in A. In 1870 there were 10 colleges, 2812 public schools, and 147 academies and other schools. The number of pupils attending school was 75,866. The annual income of the state university, located at Tuscaloosa, is \$15,000. The newspaper and periodical literature, as everywhere else in America, is very prolific. There are 89 publications of different kinds. The annual number of copies issued is 9,198,980, with a circulation of 91,165; of which the daily papers have 16,420, and the weekly 71,175. Religious denominations exhibit a similar fecundity; but the Baptists and Methodists have a vast preponderance over the others. There are various public institutions in A., such as a lunatic asylum at Tuscaloosa, a blind asylum at Mobile, a deaf and dumb asylum, and a state penitentiary at Wetumpka. The buildings of A. university are very fine, and cost \$150,000. In 1870 there were 298 libraries, with 86,577 volumes, in the state.

A. was one of the slave-states. Its government resembles that of the other states in its general features. The senate consists of 33 members, elected for 4 years; and the house of representatives of 100, elected for 2, both by the people. The judiciary consists of a supreme court, a court of chancery, nine circuit courts, and the city court of Mobile. The preponderance of the farming interests is very remarkable; though, of course, extremely natural, and even inevitable. While grocers, shoemakers, engineers, wheelwrights, masons, etc., are reckoned only by the hundred, there are upwards of 66,000 farmers—that is, more than eight times the number of persons employed in manufacturing establishments throughout the state. After the war the government became provisional. In 1868 A. acceded to the demands of congress, and the direction of state affairs was restored to the civil powers. Of its population of 996,992 in 1870, only about 9000 were born in Europe, and of these half were Irish. The commercial metropolis is Mobile: pop. 70,32,039; but the state metropolis is Montgomery: pop. 10,588. The other chief towns are Huntsville, 4907; Selma, 6484; and Marion.

ALABAMA (*ante*), one of the southern states of the American union, w. of Georgia, n. of Florida and the gulf of Mexico, e. of Mississippi, and s. of Tennessee, between 31° 30' and 35° n., and 85° and 88° 30' w.; in length from n. to s. about 336 m., and with an average width of 175; area, 50,722 sq.m. The earliest explorers in the region were Frenchmen under the Sieur de Bienville, and between 1702 and 1713 they founded a permanent settlement near the site of Mobile. Long wars with the native tribes make up what A. has of history until the cession in 1763 of all the territory, except the small corner around Mobile bay, to England by France. On the treaty of peace which secured the independence of the colonies, England ceded the territory to the new government, and soon afterwards the several states ceded their vast western domains to the federal government. By the purchase of Florida in 1819, the United States extended their southern border to the gulf of Mexico and the Atlantic, and the purchase of Louisiana in 1803 had spread our territory across what was then believed to be the great American desert almost to the shores of the Pacific. In March, 1817, the settlers around the bay of Mobile and along the river organized as a territory, and on the 14th of Dec., 1819, 20 years after Washington's death, the territory was admitted as a state, adding the twenty-sixth star to the national flag. During the war with England in 1812-15 the Creek Indians, then a powerful tribe inhabiting northern Alabama, gave the white settlers much trouble: in one instance, Aug. 30, 1813, capturing a fort and killing nearly 400 persons who sought refuge there. A large force under gen. Jackson at once marched after the Creeks, and followed them so continuously that within a year and a half they had lost more than 2000 warriors, and were glad to make peace. In 1832 the Creeks and other tribes sold their lands to the federal government and moved to their present home in the Indian territory.

"Alabama" is an Indian word or phrase, and signifies "rest," or "here we rest," probably having application to the sluggish and sleepy aspect of the main river, in its lower portion. When admitted as a state A. had a population of 127,901: 85,451 whites,

41,879 slaves, and 571 free colored. There were also a great many Indians of whom no census was made; but in 1870 there were only 98 aborigines in all the state. A. is much varied in surface; the northern part is broken by the spurs and isolated peaks of the Alleghenians; the central portion is uneven, but not remarkably hilly; the southern section for about a hundred m. from the gulf is nearly a uniform level, having a high alluvial soil easily cultivated and particularly favorable for fruits, cotton, and corn. Near the gulf the main timber is cypress and oak; further n. there are valuable pine forests; and about the middle of the state, extending quite across from Georgia to Mississippi, is the "cotton belt," where cotton is the leading product, though nearly all crops can thrive. In the upper portion of the state, above the Georgia and Tennessee borders, is the mineral section, where gold was found nearly half a century ago, and has been irregularly worked since. There is also a district underlaid with coal, covering nearly 4400 sq.m. Other minerals of importance are found, especially iron in great abundance; one bed called the Red Mountain, from the color of the ore, exhibits iron ore in a continuous line for nearly a hundred m. in a vein from about 2 ft. to 8 ft. thick. There are also valuable beds of brown hematite ore, which produces iron of the best description. Investigators report the finding of other metals, but none are of commercial importance except iron, gold, and its accompanying silver. Superior granite appears in Coosa co.; pottery and porcelain and fine clay are known, with lithographic stone, white marble, and other valuable building materials. In one locality fine variegated marbles are found.

The rivers and bays of A. are numerous, though but one of the latter is widely known to outside commerce—the bay of Mobile. Grand and Bon Secour and Perdido bays are small and unimportant. The Tennessee river dips into A. near the n.e. corner, passes through or separates eight counties, and goes out at the n.w. corner, for a few m. forming the boundary with Mississippi. The Tombigbee comes in from Mississippi near the middle of the w. boundary, and in a tortuous course takes up the Sipcey and the Black Warrior, and joins with the A. about 50 m. above Mobile bay, the two forming the Mobile river. The A. is formed by the Cahawba, the Coosa, and the Tallapoosa, and with its tributaries drains all the middle portion of the state. The Chattahoochie forms the boundary with southern Georgia and passes into Florida to the gulf; and other Florida streams, the Choctawhatchie, Yellow Water, and Escambia irrigate the s.e. portion of A. The Perdido forms the boundary with Florida.

For local government A. is divided into 65 counties. The state capital is at Montgomery; Mobile is the most important city, having a pop. of 32,034 in '70. Other places of note are Huntsville, Eufaula, Selma, Talladega, Tuscumbia, and Tuscaloosa.

A. is still well stocked with wild game, especially in the northern parts, where there are deer, rabbits, squirrels, opossums, raccoons, foxes, wild cats, and wolves; and of birds, partridges, pigeons, wild turkeys, rice birds, ducks, etc. Serpents are found; among them the dangerous moccasin. Fish of good quality are plentiful, and the alligator is occasionally seen near the coast bayous.

Besides more than 1500 m. of inland steamboat navigation along the Alabama, Tombigbee, Black Warrior, Chatthahoochie, and Tensaw rivers, A. was provided with 1839 m. of railroads in 1878, as compared with 853 m. in 1868. These roads are the Alabama Central, from Selma to Lauderdale, Miss., 96 m.; the Alabama Great Southern, from Wauhatchie, Tenn., to Meridian, Miss., 290 m., of which 250 m. are in A.; the A. and Cincinnati, from Opelika to Buffalo Wallow, and from Gadsden to Attala, 27½ m.; the Memphis and Charleston, from M. to Stevenson, Ala., 292 m., of which 106½ are in the state; the Mobile and Alabama Grand Trunk, from Mobile to Bigbee, 59½ m.; the Mobile and Girard, from Columbus, Ga., to Troy, Ala., 84 m.; the Mobile and Montgomery, from M. to M., 179 m.; the Mobile and Ohio, from M. to Columbus, Ky., 493 m., of which 78 are in the state; the Montgomery and Eufaula, from M. to E., 80 m.; the Nashville, Chattanooga, and St. Louis has a branch from Decherd to Taylorville, 33 m. in the state; the Nashville and Decatur has 28½ m. in A.; the New Orleans and Mobile has 31½ m.; the New Orleans and Selma has 21 m.; the Savannah and Memphis, from Opelika to Goodwater, 60 m.; the Selma and Greensboro, from Marion Junction to Sawyerville, 45 m.; the Selma and Gulf, from S. to Pollard, 100 m., is opened for 40; the Selma, Rome, and Dalton, from S. to the Georgia state line, 171½ m.; the Southern and Northern Alabama, from Decatur to Montgomery, 183 m.; the Vicksburg and Brunswick, from Eufaula to Clayton, 21½ m.; the Western of Alabama, from Selma to Opelika, 116 m., with branches from Opelika to West Point, 23 m., and from O. to Columbus, 29 m. There are four or five roads less than 10 m. long.

The n. part of A. possesses a most delightful climate, and invalids seek its benefits by resort to such localities as Huntsville. With the exception of malarial fevers in a few swampy places along the rivers, the whole state may be considered healthful. The heat is occasionally severe, but is not of long continuance, and a cool breeze from the gulf prevails at night over a large part of the southern section. Rain is scarce in the early summer, but plentiful in early spring, February being the rainy month. Spring and well water are excellent in the northern but poor in the center and southern portions of the state. Lying between the semi-tropic and temperate degrees, the vegetable growth of A. combines features of the two. There are various oaks, pine, chestnut, hickory, elm, cedar, and mulberry in the north. Lower down, are cane brake and cedar in clumps

like islands, the trees covered with mosses that hang like mourning weeds from their limbs. Still further s. are the cypress, live oak, and magnolia; and instead of the pears, plums, and apples of the northern states, there are oranges, pomegranates, olives, figs, apricots, and grapes. The northern portion is best adapted to cereals, the center and southern to cotton; and along and near the gulf coast sugar and rice are good crops.

On the 1st Jan., 1879, 94 periodicals were issued in A.; 6 daily, 82 weekly, and 2 semi-monthly.

In education, in which of late years good progress has been made, the latest report shows a school population of 370,245, of whom 214,720 were white, and 155,525 colored; and there were 159,659 enrolled in schools—96,136 white, and 63,523 colored; average attendance, about 62 per ct. of all enrolled. There were 3303 schools for whites, and 1452 for colored. The school age is from 7 to 21. There were 4796 teachers; schools lasting 85 days in the year, and costing \$376,954; school fund, \$377,634, and school income, \$350,000. Common and high schools are increasing in number, and are increasingly prized by the people. There are normal schools at Florence, Marion, and Talladega; having in all over 500 students. The higher grades are represented by Spring Hill college (Roman Catholic), near Mobile; Howard college (Baptist), near Mobile; Southern university (M. E. ch. south), Greenboro; and the university of Alabama (non-sectarian), at Tuscaloosa. In 1878 these colleges had 50 instructors and 486 pupils. There is a theological department of Talladega college (Congregational); an institution under the care of the American missionary association, whose work is especially among the colored people; a state agricultural and mechanical college at Auburn; a college of medicine in the Southern university, and also in the college of Alabama; and there are law schools in both the colleges last named. Several of the colleges have departments of theological education. There are experimental farms attached to the agricultural college. There are several colleges for women, under Methodist, Baptist, Presbyterian, and Episcopal management. In libraries, which in 1870 numbered 1132 private and 298 public, there was an aggregate of 576,882 volumes.

In the civil war of 1861-5 Alabama was among the earliest of the states to secede, a special convention passing an ordinance for that purpose Jan. 11, 1861; the same convention called for the general convention, which was held at Montgomery, the state capital, less than four weeks later, Feb. 4, and organized the confederate government by selecting Jefferson Davis for president. The governor of A., Andrew B. Moore, had in January taken possession of fort Morgan, in Mobile bay, and seized a revenue cutter. There was considerable opposition to secession among the people of the northern section of the state, but they made no noteworthy demonstration. In the course of the contest A. felt the power of the national arms in the capture of Selma and some other towns, but especially in the remarkable exploits of admiral Farragut in Mobile bay, the city itself being among the latest captures in the war of the rebellion. After the war a provisional governor was appointed; but the people made haste to retract the secession ordinance, and after a few months the military power was withdrawn. In Nov., 1867, a convention met to frame a new constitution, which was voted for and adopted in Feb., 1868; and in June of the same year the state was again allowed to be represented in congress. While in some of the states there was bitter opposition to the laws and methods of reconstruction, in A. there was more quietness, and no serious invasions of personal or political rights are reported.

Elections in A. are biennial; the legislature meets biennially, and is limited to a session of 50 days. The governor's term is two years, and his salary \$3000 per year. There are 33 state senators and 100 representatives, each county having at least one of the latter; and members of either house must be at least 25 years old. Senators serve four and representatives two years; their pay is \$4 per day, with mileage at 10 cts. per m. Voters must be citizens, six months residents in the state, and take oath to support the federal and state constitutions and laws; all voting is by ballot. The supreme court has appellate jurisdiction only, and must be held at the capital twice in each year: there are a chief justice and two associates, holding office six years, during which they can hold no other office of public trust or profit. Other courts of the usual order are provided. An exemption law secures from seizure for debt 160 acres with a house in the country; or, in cities, a lot and dwelling of \$2000 value; and personal property of \$1000. Interest is at 8 per ct., with complete forfeiture for usury, whether under contract or not. No provision in law is made for insolvent debtors. All property, real and personal, belonging to a woman before marriage is hers afterwards, and is not liable for the husband's debts. Wills must be in writing, signed by the testator, or by some one in his presence, and witnessed by three persons.

There are 65 counties in the state; the capital is at Montgomery, the capital of the late southern confederacy. The places having more than 10,000 inhabitants in 1870, were: Mobile, 32,034, and Montgomery, 10,588. The state has furnished of home-produced gold for the mint, \$217,233. The value per acre of all crops taken together in 1878 was \$8.25. The state debt the same year was \$9,452,669; there was raised by tax \$818,269; rate of tax, 70 cts. on \$100. The tonnage in 1878 was 72 sailing vessels, 10,245 tons; and 39 steamers, 6083 tons; total, 111 vessels and 16,328 tons.

The vote of A. for president and vice-president has been: in 1820, 3 votes for Monroe and D. D. Tompkins; 1824, 5 votes for Jackson and Van Buren; 1836, for Van Buren

and R. M. Johnson; 1840, for Van Buren and Johnson; 1844, 9 votes for Polk and Dallas; 1848, for Cass and W. O. Butler; 1852, for Pierce and W. R. King; 1856, for Buchanan and Breckenridge; 1860, for Breckenridge and Jos. Lane; in 1864 A. had no vote; in 1868, 8 votes for Grant and Colfax; 1872, 10 votes for Grant and Wilson; 1876, for Tilden and Hendricks.

**ALABAMA, THE**, an armed vessel of the Confederate states of America, which inflicted terrible injury upon the shipping of the northern states of the American Union during the civil war which broke out in 1861. The career of the A. was in more than one respect unparalleled in the history of any previous naval war. She was, for a war-ship, a small vessel, built for speed, carrying a few guns, and intended not for fighting, but for preying upon defenseless merchant-ships. She was almost the only vessel the Confederate states had upon the open seas; but the destruction she wrought was so great, and in effect so alarming, as to produce a very marked diminution in the number of commercial vessels carrying the flag of the United States. She was built, too, in a British port, and never at any time, entered a port of the state by which she was commissioned: there was no port available for the disposal of her prizes, and, ship and cargo, they were usually burned. Her career demonstrated how completely, in the present state of commerce, under the conditions of navigation and naval warfare produced by steam and long-range artillery, belligerents fairly matched might ruin each other at sea; and it raised international questions between the United States and Great Britain, which more than once threatened to issue in the gravest consequences to both nations. Even the end of the A. was singular and instructive: perhaps it was too honorable an end for such a career as hers. She went down in an artillery duel, quixotically entered upon for a fancied point of honor, with a vessel protected by armor: illustrating the impotence, in modern naval warfare, of the gallantry of the most gallant of seamen against advantages derived from speed, armament, and armor.

At the beginning of the civil war in 1861, the Confederate states were without a navy, and apparently without the means of acquiring one. Their population was agricultural; they had neither ships nor seamen; and the northern states promptly instituted an effective blockade of nearly all their ports. The able men who had planned the secession of the southern states from the American Union had not overlooked the subject of a navy; but events had been against them. They had reckoned upon securing a part of the United States fleet; and before the war commenced, they had determined upon fitting out small and swift vessels, carrying a few heavy guns, to cruise against the northern commerce. They had no lack of able naval officers; for a majority of the senior naval officers of the United States were southern men, and were at their command. Early in 1861, while parleying was still going on between the North and the South, and hopes of a peaceable separation were not extinct, capt. Raphael Semmes had been empowered by the southern leaders to purchase ships and stores for the South; but as regards ships, capt. Semmes appears to have been unsuccessful. It was not till several months after the war began, in June, 1861, that the Confederate states were able to send their first armed cruiser to sea. This was the *Sumter*, a small steamer, which had previously traded between New Orleans and Havana. Capt. Semmes, who was appointed her commander, was singularly qualified for the work expected of him. He was a native of Maryland, about 51 years of age; he had been a commander in the U. S. navy, and now held the same rank in the service of the southern states. Besides possessing high professional abilities and attainments, he was a man of acute intellect and of decided character; and he was thoroughly instructed in the principles and details of international law and etiquette. He seems to have united with the good qualities of a naval officer the qualifications of an able lawyer, diplomatist, and publicist. He could be trusted to secure for a war-vessel of the Confederacy, however small, every advantage to which she was entitled from neutral powers; to give to subjects of neutral powers, and of the other belligerent alike, nothing which was not strictly their due; to carry out without flinching, unmoved by taunts and abuse, the work of destruction which was expected at his hands. His career in the *Sumter* is a record of triumphs won over neutral governors and ministers, who were disinclined to admit the little *Sumter* to the position of a belligerent war-vessel; of clever avoidance of the enemy's cruisers, of which several were always on his track; and of the destruction of valuable ships and cargoes belonging to citizens of the United States. The *Sumter* and her captain were soon known throughout the world. The enemy called capt. Semmes a pirate, and could they have caught him, would probably have treated him as a pirate. But he appears to have done nothing but what it was his right as a belligerent to do; at any rate, he was scrupulous not to exceed the precedents of international law. It was upon his system of burning his captures, not upon the captures themselves, that the people of the northern states founded their charge of piracy; but no Confederate port was open to him for the disposal of his prizes; and his treatment of them, though it greatly shocked an age which had seen scarcely anything of naval warfare, was warranted by precedents, and was probably, though not unquestionably, within his right. As an occasional resource, to be adopted upon an emergency, the burning of captures made at sea is undoubtedly lawful; it is not so certain that a belligerent is at liberty to carry out a *system* of burning captures, made without the hope of being able to bring them into port for adjudication before a prize court. The cruise of

the *Sumter*, which began on the 30th June, 1861, with her escape from New Orleans, then strictly blockaded, was over before the end of the year; but she had captured 13 vessels, had spread alarm through the northern sea-ports, and had put ship-owners and merchants to heavy charges for insurance; and by disinclining merchants to ship their goods in northern vessels, had seriously injured the shipping trade of the northern states. Eventually, she was laid up at Gibraltar, and declared unfit for further service: had she been seaworthy, it would have been very difficult to carry her out of a port where she was diligently watched by northern cruisers. She had, however, verified the anticipations of the Confederate government; and in 1862, this government found a successor for her, much better fitted for the work to be done, and destined to far greater celebrity. This was the *Alabama*.

This vessel was built for the Confederate government by Messrs. Laird & Sons at Birkenhead. She was a screw steam-sloop of 1040 tons register, built of wood, and for speed rather than strength. She was bark-rigged, and was fitted with two engines of 350 horse-power each; she was pierced for 12 guns, and had the means of carrying two heavy pivot-guns amid-ships. She cost £47,500 without her equipment: including her equipment, £51,716. Semmes, now a captain in the Confederate service, was, in June, 1862, appointed to superintend her equipment, and take command of her when ready for sea. Both capt. Semmes and commander Bullock, who had superintended the building, were enjoined by the Confederate government to keep the destination of the vessel as secret as possible, and carefully to avoid any infringement of public law or of the municipal law of Great Britain, which would give the British government a pretext for seizing her. These instructions were carefully acted upon. The destination of "No. 290," as she was called from her number in the list of steam-ships constructed by the Messrs. Laird, was so well concealed, that she was nearly finished before it was suspected by the emissaries of the United States. According to previous practice, there was no great difficulty in avoiding the infringement of the public and of the municipal law in such a case. It had been held lawful to build vessels for a belligerent in neutral ports, and lawful to purchase guns and stores in neutral ports, though they might be for the equipment of vessels thus built. What had been held unlawful was the equipment with guns and war-like stores of a vessel built for a belligerent in a neutral port previous to her leaving the neutral jurisdiction. Capt. Semmes did not intend to equip his vessel at Birkenhead, and therefore, supposing the rules of public law to have remained unchanged, he intended no infringement of the law. But the U. S. minister called upon the British government to detain the "No. 290," submitting some evidence that she was intended for a Confederate war-vessel. He maintained, or, at any rate, it has since been maintained on the part of the United States, that her construction, being that of a war-vessel, was so different from that of vessels built for trade, as itself in some measure to constitute an equipment for war. The British government consulted the crown lawyers, who at first thought the evidence of destination insufficient. Afterwards, when further evidence was presented, a delay was caused by the illness of Sir John Harding, the queen's advocate. When an opinion favorable to the detention of the vessel was at length given, "No. 290" was gone. The builders, made aware of the danger of a seizure, had made haste with their work; the vessel, though unfinished, was got ready for sea; under pretense of a trial trip, she made her way down the Mersey to Moelfra bay, where the work remaining to be done was actively carried on; and on the morning of the 31st July, 1862, warning having been given that she was to be seized that day, the "No. 290" steamed away from the British coast. The ablest English lawyers were of opinion that there had been no infringement of the law, but that a case had been presented which the British government was bound to submit to a court of law. The detention of the vessel during a protracted lawsuit would have served the purposes of the United States almost as well as her condemnation; and as she must have been detained but for the delay caused by Sir J. Harding's illness, it is not without a show at least of reason that the U. S. government claimed from Great Britain indemnification for the losses consequent upon her escape.

"No. 290" made for Terceira, one of the Western islands, where she arrived on the 13th of Aug.—her speed and sea-going qualities being fully proved upon the voyage; and a few days after she was joined by the *Agrippina* of London, carrying her guns, stores, and supply of coal, and by the *Bahama*, with capt. Semmes and his officers on board. By the 24th of Aug. she had shipped her armament and stores and was ready for sea; and now capt. Semmes produced his commission to the sailors, named the vessel the *A.*, and hoisted the Confederate flag. The sailors on board the *A.* and her consorts were Englishmen, all entered for a feigned voyage; but with few exceptions they enlisted under capt. Semmes, though the terms upon which they insisted were exorbitant. The crew now consisted of 80 men all told, and the armament of eight 32-pounders. By the end of Aug. the vessel was got into good order, and she made her first capture on the 5th of Sept. Within 11 days of that date she captured and burned property the value of which exceeded her own cost. The people of the United States were filled with indignation against Great Britain for permitting the escape of such a destroyer. Their indignation against "the pirate Semmes" was only less than the alarm with which they regarded the depredations of the *A.* Several fast-sailing cruisers were sent in search of her.

Capt. Semmes made for the American coast, which he had determined to make his first cruising ground. He was ambitious of making a few captures within sight of New

York; but running short of coal, he was obliged to give up this somewhat daring scheme, and make for a coaling-station. He afterwards lay on the track of the California mail-steamers running between Aspinwall and New York; and after waiting for some time he captured the *Ariel* mail-steamer, with 140 marines, several U. S. officers, and 500 other passengers on board. A heavy gun and a quantity of specie were all that he took by this capture, but it greatly raised the prestige of the A., and increased the alarm of American ship-owners. The passengers and crew of the *Ariel* were too numerous to be taken on board the A.; and as capt. Semmes found yellow fever raging at Kingston in Jamaica, at which port he intended to have landed them, he was unable to destroy the vessel, and had to set her free, after taking a bond for a large sum to be paid on the conclusion of the war. Shortly after, on the 11th Jan., 1863, an encounter occurred between the A. and a U. S. vessel, which still further augmented the reputation of the former. Cruising off Galveston in Texas, the A. gave battle to the U. S. gunboat *Hatteras*, an old vessel, somewhat her inferior in armament, and sunk her after a few broadsides. The destruction of the *Hatteras* and the capture of the *Ariel* were the most remarkable events in the career of the A. until her closing scene arrived. Her history consists of a monotonous succession of captures made in different seas, her prizes being merchant-vessels incapable of resistance, which were burned, or, when there was convincing evidence of the neutral ownership of the cargo, which did not often happen, liberated upon bond. She captured in all 65 vessels; and the value of the property she destroyed has been estimated at \$4,000,000. It was, however, by the heavy insurance for war-risks to which she subjected them, and still more by the difficulty she caused them in getting freights that the A. career inflicted the greatest injury upon the ship-owners of the United States. When the pursuit after her became too hot on the American coast, she sailed for the cape of Good Hope and cruised in the eastern seas. Returning to Europe, she arrived in the English channel in June, 1864, and on the 11th of June entered the French port of Cherbourg to refit and supply herself with stores. She had been nearly two years at sea, and had got into bad condition; her speed and sailing qualities were considerably impaired. Permission to make the necessary repairs was given by the authorities of the port of Cherbourg.

But within a few days the U. S. steamer *Kearsarge*, commanded by capt. Winslow, a former shipmate of capt. Semmes, arrived at Cherbourg; and she made a demonstration which the officers and crew of the A.—writhing under the abuse that had been heaped upon them, and aware that their career had been inglorious—regarded and resented as a challenge. Capt. Semmes knew and probably shared their feelings, and determined to gratify them. He sent notice to the U. S. consul that he would sail out and fight the *Kearsarge*. The two ships were to appearance not unequally matched, in reality the *Kearsarge* had considerably the advantage in number of crew, armament, speed, and general condition; besides, that she was protected amid-ships by armor. The fact of her being thus protected, and the extent of her superiority, seem to have been unknown to capt. Semmes. The fight took place on Sunday, the 19th of June, outside the port of Cherbourg, all Cherbourg gazing at it from the neighboring heights. The *Kearsarge* having the superiority in sailing, was able to keep at a distance of about 500 yds. from her enemy; her armor in a great measure protected her from the enemy's shot; and, as might be expected her guns were better served than those of the A. Before the fight had lasted an hour, capt. Semmes found his ship was sinking, and gave orders to pull down his flag. The boats were got out and the wounded placed in them; but before the *Kearsarge* could come to the rescue the A. went to the bottom. The boats of the *Kearsarge* saved many of the crew. Others, including capt. Semmes, were picked up by an English yacht, the *Deerhound*, which had been allowed by capt. Winslow to help in rescuing the A.'s crew. These the *Deerhound* immediately carried within the neutral jurisdiction. Semmes and the others saved by this vessel were afterwards charged with having broken their faith as prisoners who had asked for quarter from the *Kearsarge*. As regards the *Deerhound*, the seamen of the A., once upon its deck, were entitled to the protection of Great Britain, and no previous compact could have deprived them of it.—See *The Cruise of the Alabama and the Sumter*, compiled from the papers of capt. Semmes.

The "Alabama question" was fairly raised in the winter of 1862-63, when Mr. Seward, in his diplomatic correspondence, declared that the Union held itself entitled at a suitable time to demand full compensation for the damages inflicted on American property by the Anglo-rebel vessels; and the question never ceased to be a source of irritation between the two peoples till its final settlement by special tribunal of arbitration. This court, consisting of the representatives of England and the United States, and of three other members appointed by the king of Italy, the president of the Swiss confederation, and the emperor of Brazil, met at Geneva, 17th Dec., 1871, and, the claim for indirect damages to American commerce having been allowed to drop, gave its final award, 15th Sep., 1872. It was decreed that Great Britain should pay a sum of £3,229,166 13s. 4d.

**ALABASTER.** This name is given to two kinds of white stone, chemically distinct, but resembling each other in appearance, and both used for ornamental purposes. A. proper is a white, granular, semi-transparent variety of gypsum (q.v.) or sulphate of lime. It occurs in various countries, but the finest is found near Volterra, in Tuscany, where it is worked into a variety of the smaller objects of sculpture, vases, time-piece stands, etc.

Gypseous A. of good quality is also found in Derbyshire, and many ornamental articles are made of it at Matlock and other places. Not being quite insoluble in water, it cannot be exposed to the weather; and its softness makes the surface easily become rough and opaque. Nor is it generally found in sufficient masses for large works. The other stone is a compact, crystalline carbonate of lime deposited from water in the form of stalagmite, etc. It is distinguishable from the gypseous alabaster by its effervescing with an acid, and by its hardness; real alabaster may be scratched with the nail.—The name is derived from Alabastron, a town in upper Egypt, where this kind of stone was abundant, and was manufactured into pots for perfumes. Such pots were called *alabastra*, even when made of other materials.

**ALABASTER, WILLIAM, D.D.**, 1567–1640, an English poet and scholar. He was educated at Cambridge and Oxford, and was a fellow of Trinity college. He was appointed chaplain to Robert, earl of Essex, whom he accompanied in 1591 in the expedition intended to assist Henry IV. against the league. In France he was converted to the Roman Catholic church, but did not long remain in it. His report was that he was enticed to Rome and imprisoned, but escaped. Returning to England he became prebendary of St. Paul's and rector of Hatfield. A. was a famous Hebrew scholar, with a strong inclination to mysticism in tracing the meaning of scripture. Dr. A. published several works on scriptural subjects, and left a number of poems in MSS., one of which was surreptitiously published—a tragedy called *Rorana*, which Dr. Johnson regarded as the only Latin verse of English production worth naming until Milton appeared.

**A LA CAPEL/ LA**, or **A CAPELLA**, in music, means in the church style; it is equivalent to *alla breve* (q. v.), a time-signature which frequently appears in church-music. It also denotes that the instruments are to play in unison with the voices, or that one part is to be played by a number of instruments.

**ALACH'UA**, a co. in n. Florida, between the Santa Fe and Suwannee rivers, crossed by the Florida railroad; 1000 sq. m.; pop. '70, 17,328—12,393 colored. It has a rolling surface and fertile soil, producing sea-island cotton, sugar, etc. Co. seat, Gainesville.

**ALACQUE, MARGUERITE MARIE**, 1647–90; a French nun, who established the festival of the sacred heart of Jesus. She took the veil at Paray-le-Monail, where she is said to have performed miracles, prophesied, made revelations, and held direct communication with God and the angels. She foretold the day of her death, and cut the name of "Jesus Christ" on her bosom with a knife. By the Roman Catholic church she is called "venerable." Her treatise on devotion to the heart of Jesus she claimed to have been a supernatural communication.

**ALADAGH'**, a mountain chain in Asiatic Turkey in which the Euphrates rises. The chief portion of the chain is above the basin of the lake Van, between 39° and 40° n. and 42° and 44° e., forming part of the water-shed between the Caspian sea and the Persian gulf.

**ALAGO'AS**, a maritime province of Brazil, which formed at one time a district of the province of Pernambuco. It is bounded on the n. and w. by Pernambuco, and on the s. is divided from the province of Sergipe by the navigable river San Francisco. The country, which is mountainous in the n.w., and low, marshy, and unhealthy on the coast, contains (1872) 348,009 inhabitants. The chief productions are the sugar-cane, cotton-plant, mandioc or cassava, maize, rice, etc., and also timber and dye-woods. The capital, A., is situated on the lake Manguaba. The name A. is derived from the lakes (*lagoas*) in which the province abounds.

**ALAIN DE LILLE**, 1114–1203; a Cistercian scholar, called "the universal doctor," one of the most learned men of the 12th c., in philosophy, theology, history, medicine, and poetry. He was appointed bishop, but soon resigned to enter a monastery. He wrote chiefly in verse on alchemy, natural philosophy, and doctrinal subjects. Germany, Scotland, Spain, Sicily, and Flanders contend for his birthplace; but he said he came from Lille in Flanders, as his name implies.

**ALAIS**, a t. of the dep. of Gard, France, situated in a fertile plain, on the right bank of the Gardon, at the base of the Cevennes mountains, 23 m. n.w. from Nîmes, with which it is connected by railway. It embraced the Protestant cause in the religious wars of France; and Louis XIII. in person, accompanied by the cardinal de Richelieu, besieged it, and having taken it in 1629, demolished its walls. Three years later, the baron of A. having taken part in the rebellion of Montmorency, the castle was destroyed. Protestantism still prevails to a considerable extent. A. is a very flourishing t., and owes its prosperity chiefly to the mineral wealth of the surrounding district, which produces coal, iron, lead, zinc, and manganese. The coal and iron mines are of chief importance. There are large iron-foundries in the town and neighborhood. There are also manufactures of ribbons, stockings, gloves, vitriol, and earthenware. A. is an episcopal seat. Pop. '75, 15,384.

**ALAJUELA**, a city of the state of Costa Rica, Central America, 23 m. w.n.w. from Cartago, and a little on the western side of the water-shed between the Atlantic and the Pacific. It contains many good houses, and has extensive suburbs of detached houses,

embowered among trees and flowering shrubs. The neighborhood is chiefly devoted to the culture of the sugar-cane. Pop., including suburbs, 12,575.

ALAKO', the messiah of the gypsies, the son of their chief god, Baro-Devel. The gypsies hold that A. will ultimately restore them to their native place in Assyria. He is represented with a sword in his right hand, and a pen in his left.

ALAMANCE, a co. in North Carolina, on the Haw river and the North Carolina railroad; 500 sq.m.; pop. '80, 14,613—466 colored. It has an undulating surface and fertile soil, producing tobacco, corn, etc. Co. seat, Graham.

ALAMANNI, LUIGI, a distinguished Italian poet, b. at Florence, Oct. 28, 1495. His father, a man of noble birth, was a zealous partisan of the Medici, and Luigi stood high in their favor till in revenge for some real or fancied wrong he conspired against the life of cardinal Giuliano, the representative of Leo X. This being found out, A. fled to Venice, and thence, on the accession of the cardinal to the papal chair, to France. In 1527, encouraged by the pope's reverses, he returned to Florence, and urged the republic to seek the protection of Charles V., by means of Andrea Doria's friendly mediation. The republic declared such a proposal treachery, and A. sailed with Doria for Spain. Finally, he settled in France, employed as a diplomatist by Francis I. and Henry II. A. d. at Amboise in 1533. He wrote epics, dramas, and minor poems, much admired in their day, and disputes with Trissino the claim of first introducing blank verse into Italian poetry.

ALAMEDA, a co. in w. California, on the bay of San Francisco, and traversed by several railroads; 820 sq.m.; pop. '80, 63,639—1939 Chinese. The land is fertile, and the scenery especially attractive. There are medicinal warm springs, impregnated with iron, lime, sulphur, and magnesia. Co. seat, Oakland.

ALAMO, THE, a fort founded in the Texan war of independence near San Antonio, Bexar co., Texas. It was oblong, covering about an acre, with walls 8 or 10 ft. high, and a yard in thickness. Here, Feb. 23, 1836, Santa Anna with 4000 Mexicans shut in 140 Texans and men from the United States commanded by col. Wm. B. Travis. Bombardment was kept up 24 hours, and several assaults were repulsed; Travis sent for help, but only 32 men reached him, and all his men suffered greatly from fatigue and want of provisions. On the 6th of Mar. at daylight the Mexicans assaulted in force, and were twice driven back with heavy loss. A hand to hand fight ensued, in which, lacking time to load, the Texans clubbed their rifles and fought desperately until only six were alive. These, of whom col. Crockett was one, surrendered under promise of protection, but Santa Anna had them instantly cut to pieces; col. Bowie, ill in bed, was shot after killing a number of his assailants, and maj. Evans was shot while trying to fire the magazine. Only three—a woman, a child, and a servant—were spared. Then the bodies were collected, mutilated, and burned. A few weeks later Santa Anna was routed with immense loss and himself captured in the battle of San Jacinto, where the cry "Remember the Alamo" excited the Texans to fight like heroes.

ALAMOS, Los (i.e., *The Poplars*), a t. of Mexico, in the state of Sonora, and department of Sinaloa, 110 m. n.n.w. from Sinaloa. It is situated in a barren plain, but in a region famous for its silver mines. The houses are mostly of stone or brick, covered with stucco. Provisions are dear, being brought from a distance, and the t. is very insufficiently supplied with water. Pop. 10,000.

ALAN, ALLEN, or ALLYN, WILLIAM, 1532-94; an English cardinal. He studied in Oxford, and became principal of St. Mary's hall in 1556. Two years later he was made canon of York. He opposed the reformation, and on the accession of Elizabeth fled to Louvain. After a while he returned to England, but his proselyting zeal made another flight necessary. He was given a doctor's degree by the new university of Douay, and established there a college for English Roman Catholics, whence he sent Jesuit priests to his native land, the aim of his life being to restore papal supremacy in England. In 1589 he was made archbishop of Mechlin. He was a bitter enemy of Elizabeth, who expelled some of his emissaries and put some to death. In one of his pamphlets he made charges against the queen too foul for decent pages. He was in the armada plot—the pope having promised him the see of Canterbury in case of success. He fell into disfavor with the failure of the armada, and was even refused permission to return to his diocese.

ALAND ISLANDS (pronounced Oland), a numerous group of small islands and rocks at the entrance of the gulf of Bothnia, opposite Abo, about 25 m. from the Swedish coast, and 15 from that of Finland. They are called, by the Finns, Alvenanmaa. About 80 of them are inhabited. Although these rocky isles are covered with but a thin stratum of soil, they bear Scotch fir, spruce, and birch trees, and with proper cultivation produce barley and oats, besides affording subsistence to a hardy breed of cattle. The inhabitants are of Swedish origin, skillful sailors, fishermen, and seal-hunters. The total population is about 16,000. The largest of the islands, which gives its name (signifying "land of streams") to the whole group, is about 18 m. long by 14 broad. It is tolerably wooded and fruitful, and contains nearly 11,000 inhabitants. These islands belonged formerly to Sweden, but were seized by Russia in 1809. Previous to this, they had several times changed hands between these two powers. In 1717, the Swedes

were defeated by the Russians in a naval engagement near Aland, the first important exploit of the Muscovite navy. The importance of these islands as a military position led to the construction, in the reign of the emperor Nicholas, of those strong fortifications at Bomarsund which, in Aug., 1854, were destroyed by the Anglo-French force, commanded by Sir Charles Napier and Baraguay d'Hilliers. Two thousand prisoners were taken. This extensive fortress (which is supposed to have been but the first of an intended series of similar menacing fortifications in the Baltic) commanded the anchorage of Ytternæs, capable of containing a large fleet.

**ALANGIA'CEÆ**, a natural order of dicotyledonous plants, allied to *Myrtaceæ* (q.v.), and containing only about eight known species, trees and large shrubs, of which the greater number belong to the American genus *nyssa* (see TUPELO), differing from the rest of the order in the absence of petals. The one-celled fruit, and pendulous albuminous seeds, constitute marks of distinction from myrtaceæ. The fruit of *alangium decapetalum* and *A. hexapetalum*, natives of the East Indies, are eatable, but mucilaginous and insipid. The timber is good, the roots aromatic.

**ALANI**, nomadic tribes of eastern origin who spread over Europe during the decline of the Roman empire. They probably were first encountered by the Romans when Pompey, in the Mithridatic war, led an expedition into the Caucasus. In 276 A.D. they were checked by the emperor Tacitus in their attempt to go eastward into Persia. The Huns gave them a severe defeat on the Tanais in 375, and then the A. divided, some going e., but the larger portion joining their conquerors in an invasion upon the Goths. With the Vandals and Suevi they entered Gaul in 406, and later crossed the Pyrenees and founded settlements in Lusitania, where they lived for some time in peace. In 418 they were attacked by the Visigoths, their king was slain, and they became subject to Gunderic, king of the Vandals, losing completely their national independence. About 450 they served under Theodoric; but they sympathized with the barbarians, and their desertion at Chalons (451) came near bringing defeat upon the Roman army. They were mentioned occasionally in later times, and seem to have kept their independence after the 6th c. In 1221, Gengis Khan defeated them, and they were so completely subjugated in 1237 by Batu-Khan that their name disappeared from history.

**AL-ARAF**, in the Mohammedan religion, the line or wall of separation between heaven and hell, astride of which are placed those whose accounts of good and evil exactly balance, so that they deserve neither hell nor heaven; also those who went to war without consent of their parents, who are deemed martyrs, safe from hell but not quite worthy of heaven.

**ALARCON, HERNANDO DE**, a Spanish navigator of the 16th c., the first to visit the coast of California. He sailed May 9, 1540, to meet a land expedition under Vasques de Coronada, but did not find him. He discovered that lower California (a supposed island) was a peninsula, made a good survey of the coast, sailed up the Rio de Tizon (Colorado), and on returning to Mexico, in 1541, made a map of California, which differs little from those of the present day.

**ALARCON Y MENDOZA, JUAN RUIZ DE**, one of the most eminent of Spanish dramatists, b. at the t. of Tasco, in Mexico, about the end of the 16th c. He belonged to the ancient family of the Ruizes of Alarcon, of which a branch had emigrated to America. Having studied at the college that had been instituted in Mexico, he removed to Spain, where he is mentioned as *Relator del real consejo de las Indias* (reporter of the royal council of the Indies) in 1622. The success that early attended his pieces, joined to the haughty disdain with which, in the consciousness of his own powers, he treated the opinion both of the public and of his brother-writers, excited the envy and jealousy of his contemporaries, so that he became the object of venomous epigrams by the most famous poets of the time, in which the deformed upstart from New Spain, with his pride and contemptuousness, was held up to public ridicule. This kind of persecution continued till his death, which occurred in 1639. Even during his lifetime, his best pieces were attributed to others, and were printed and represented under the names of more favored poets. This early withdrawal and oblivion of his name, together with the scarcity of his works, have been the cause that he has seldom been mentioned and still less appreciated by historians of literature, even down to the latest times. Yet some of the best critics rank him next to Calderon and Lope de Vega as a dramatic writer. Besides many single or detached pieces printed in collections, he published a number in his *Comedias* (vol. i., Madrid, 1628; vol. ii., Barcelona, 1634). Hartzenbusch began a collected edition at Madrid, 1848. A. attempted almost all the kinds of drama in vogue in his time; and was especially eminent in the heroic, as the best specimens of which may be mentioned *El Tejedor de Segovia* and *Ganar Amigos*, or *La que mucho vale mucho cuesta*. A.'s mastery in delineating character is shown in the *Comedias de Costumbres*, or character-comedies, of which he may be held as the creator. The best known are *La Verdad Sospechosa* (imitated by Corneille in his *Menteur*) and *Las Paredes Oyen* (Walls have Ears), which are yet represented on the Spanish stage. Of his comedies of intrigue, the best specimen is *Todo es ventura*. It does not appear that A. wrote any *Autos* or sacramental allegorical dramas, though his two pieces, *El Antichristo* and *Quien mal anda en mal acuba*, betray a tendency to ascetic mysticism. Although, through the artifices of his contemporaries, as well as the éclat of

Lope de Vega's and Calderon's dramas, the compositions of A. were soon driven from the stage, yet he remains, together with Tirso de Molina, the most distinguished and original among the successors of Lope. Lope and Calderon, the coryphæi of that age, are the only dramatists that excel A. Combining, in no mean degree, the characteristics of both, he excels them in purity of language and elevation of moral feeling.

**AL'ARIC I.** (in German, Al-ric, i.e., all rich) belonged to one of the noblest families of the Visigoths. He makes his first appearance in history in 394 A.D., as leader of the Gothic auxiliaries of Theodosius in his war with Eugenius; but after the death of the former, he took advantage of the dissensions and weakness that prevailed in the Roman empire to invade (395) Thrace, Macedon, Thessaly, and Illyria, devastating the country, and threatening Constantinople itself. Rufinus, the minister of Arcadius, appears to have sacrificed Greece in order to rescue the capital, and Athens was obliged to secure its own safety by ransom. A. proceeded to plunder and devastate the Peloponnesus, but was interrupted by the landing of Stilicho in Elis with the troops of the west. Stilicho endeavored to hem in the Goths on the Peneius; but A. broke through his lines, and escaped with his prisoners and booty to Illyria, of which he was appointed governor by the emperor Arcadius, who was frightened by his successes, and hoped, by conferring this dignity on him, to make him a peaceful subject instead of a lawless enemy (396). In 402, he invaded upper Italy, and Honorius, the emperor of the west, fled from Rome to the more strongly fortified Ravenna. On the way to Gaul, A. was met and defeated by Stilicho at Pollentia on the Tanaro; but it was not till the following autumn that the result of the battle of Verona forced him to retire into Illyria. Through the mediation of Stilicho, A. concluded a treaty with Honorius, according to which he was to advance into Epirus, and thence attack Arcadius in conjunction with the troops of Stilicho. The projected expedition did not take place, yet A. demanded indemnification for having undertaken it; and Honorius, by the advice of Stilicho, promised him 4000 pounds of gold. When, after the death of Stilicho (q.v.), Honorius failed to fulfill his promise, A. advanced with an army, and invested Rome, which he refused to leave till he had obtained the promise of 5000 pounds of gold and 30,000 of silver. But neither did this negotiation produce any satisfactory result, and A. again besieged Rome (409 A.D.). Famine soon rendered it necessary that some arrangement should be made; and in order to this, the senate proclaimed Attalus, the prefect of the city, emperor instead of Honorius. But Attalus displayed so little discretion, that A. obliged him publicly to abdicate. The renewed negotiations with Honorius proved equally fruitless with the former, and A. was so irritated at a perfidious attempt to fall upon him by surprise at Ravenna, that he advanced on Rome for the third time. His victorious army entered the city on Aug. 24, 410, and continued to pillage it for 6 days, A. strictly forbidding his soldiers to dishonor women or destroy religious buildings. When A. quitted Rome, it was only to prosecute the conquest of Sicily; the occurrence of a storm, however, which his ill-constructed vessels were not able to resist, obliged him to abandon the project for the time; and his death, which took place at Cosenza, in Calabria, soon after (410), prevented his resuming it. In order that his remains might not be discovered by the Romans, they were deposited in the bed of the river Busento, and the captives who had been employed in the work were put to death. Rome and all Italy celebrated the death of A. with public festivities; and the world enjoyed a momentary repose. But A. himself was much less barbarous than his followers. He admired those monuments of civilization with which the eternal city abounded, and sought to preserve them; he checked the excesses of his fierce soldiery, and at times gave indications that the lessons of Christianity which he had learned from the Arian missionaries had not been altogether forgotten. Yet through him the Goths learned the way to Rome.

**ALARIC II.** 8th king of the west Goths, or Visigoths, succeeded his father in 484 A.D. He was of a peaceful disposition, and wished to live on friendly terms with the Franks. His dominions were very extensive. Besides Hispania Tarraconensis and Bætica, he possessed numerous rich provinces in Gaul, and formed an alliance, which still further increased his power, with Gondeband and Theodoric, the latter of whom was his father-in-law, and king of the east Goths. At length, however, he came into collision with the Frankish monarch, Clovis, whose cupidity had been excited by the extent and fertility of the territories over which A. ruled. An excuse was found for breaking the peace which existed between the two nations, in the fact that A. was a zealous Arian. This circumstance had given great offense to many of his subjects, who were orthodox Catholics; and ostensibly to vindicate the true doctrine, the newly converted barbarian, Clovis, declared war against him. The result was fatal to A. He was slain by the hand of Clovis himself at Vouillé, near Poitiers, and his forces completely routed.

A. is said to have been indolent and luxurious in his youth; but this may simply imply that he was not fond of those sanguinary pleasures which captivated his savage contemporaries. He was tolerant in his religious convictions. Though an Arian, he did not persecute the Catholics. He enacted several useful statutes, and kept a watchful eye on all parts of his kingdom. It was during his reign that the *Breviarium Alaricianum*, or code of A., was drawn up. It is a selection of imperial statutes and writings of the Roman juriconsults. A. sent copies of it to all his governors, ordering them to use it, and no other. An edition of it was published by Sichert, at Basle, in 1528.

**ALARM'.** In military matters, the word alarm has a more defined meaning than mere terror or fright. An alarm, among soldiers in an army, is not so much a danger, as a warning against danger. An alarm, signified by the firing of a gun or the beating of a drum, denotes to an army or camp that the enemy is suspected of intending a sudden surprise, or that the surprise has actually been made. There is an *alarm-post* in camp or garrison arrangements, to which the troops are directed to hasten on any sudden alarm being given.

**ALARM, BURGLAR,** an application of wires and a battery, whereby every door, window, scuttle, or other means of entrance to a building is so connected by electricity, that an attempt to open any one sets a bell ringing in one or more sleeping rooms or in the watchman's quarters. The battery is in a box 20 in. by 9x6, and all the wires are entirely concealed. A switch shuts off the battery in the day-time, or when not needed; and the alarm may be set for the whole or any part of a house. Alarm is given if a door or window be accidentally left open, and the bell rings continuously unless purposely stopped. The B. A. is largely used in private houses in New York and other cities.

**ALASCO, JOHN, 1499-1560;** a Polish nobleman and traveler, who imbibed the doctrines of Zwingli, and had intercourse with Erasmus, who esteemed him highly, bequeathing to him his library. He first preached Protestantism in east Friesland, but, anticipating persecution, he went to London, on Cranmer's invitation, and became superintendent of the congregation of the foreign Protestant exiles. On the accession of Mary, in 1553, he and all his congregation were banished. In 1556, he returned to Poland, where he died. He wrote many treatises, and was one of the 18 divines who prepared the Polish version of the Bible.

**ALA-SHEER'** (i.e., *the exalted city*, ancient *Philadelphia*), a city of Asia Minor, in the pashalic of Anatolia, 75 m. e. by s. from Smyrna, at the n.e. base of Mt. Tmolus. It was founded by Attalus Philadelphus, king of Pergamos, about 200 B.C., and is famous as the seat of one of the "seven churches of Asia." It is still a place of considerable importance, and carries on a thriving trade by caravans, chiefly with Smyrna. It is surrounded by a wall, and is of large extent; but the streets are narrow and dirty. There are many interesting remains of antiquity. Pop. about 8000, including 250 Greek families.

**ALASKA,** the name now given to the whole of what was once Russian America, in the n.w. corner of North America, but acquired from Russia by the United States in 1867, at a price of \$7,200,000. The name *Alaska* is attached to the peninsula of A., of which the Aleutian isles form the natural continuation, and which was at first regarded by the Russians as an island. The connection of the peninsula with the continent was left to be ascertained by capt. Cook in his explorations in search of an arctic passage. The territory of A. embraces an area of 500,000 sq. m., with a population, according to the census of 1870, of 70,461, but since estimated at only 25,000. A volcanic mountain-chain runs along the coast of A., and out into the peninsula. The chief river is the Yukon, which rises in the Rocky mountains, and has a course of 2000 m. The vegetable productions of A. are very scanty, but its whale, salmon, cod, etc., fisheries are important. The moose, reindeer, and bears abound. The chief settlement is Sitka, formerly called New Archangel. Attached to A. are the Prybilov islands, the seal fishery of which brings an annual rental to the United States of £60,000, while A. itself has hitherto been an actual charge upon the state treasury.

**ALASKA (ante),** comprises all the N. American continent w. of the 141st degree of w. long., together with a narrow strip between the Pacific ocean and the British dominions; also all the islands near the coast, and the Aleutian archipelago, except Copper and Behring islands on the coast of Kamtchatka. The area, including islands, is 580,170 sq. m.; and in 1870 the population amounted to 29,097, of whom 26,843 were natives of the territory, 1421 were half-breeds, 483 Russians, and 350 from the United States and foreign countries. The capital is Sitka, formerly called New Archangel, and is the only t. of importance in the territory. It is on a commodious harbor on Baranov island, 53° 3' n. lat., and 135° 17' w. long. The t. was long the headquarters of the Russian-American fur company. When the cession to the United States was made in 1867, Sitka was a collection of log huts about 100 in number, with but few respectable buildings, and these were occupied by government officers. St. Paul, in Kodiak island, is the principal depot of the seal fisheries, and around it is the best agricultural land in the territory. There is another considerable settlement on Oonalska island, where there is good anchorage. Trading ports are scattered over the sea-coast of the territory, the chief of them being Fort Yukon, near 66°, the most northerly station of the Hudson bay company. Little is known of the interior of the territory except along some of the large rivers. The coast line measures over 4000 m. along the Arctic ocean on the n., Behring's sea on the w., and the Pacific ocean on the s. The climate is much less severe than in corresponding latitudes on the e. coast of the continent, as it is moderated by the warm water of the Pacific, whose effect upon the w. coast of North America is like that of the gulf stream upon the w. coast of Europe. In the Yukon, or most northerly districts, it is very cold; the earth remains frozen all summer, and ice in the river Yukon is from 5 to 9 ft. thick in winter. The islands and the

southern or Sitka district are not so cold. The lowest record of temperature is 70° Fahr. below zero. The summer is short, dry, and hot. May to Aug. is the pleasant season, and rain falls almost continuously in Aug. and Sept. The average annual rain-fall is about 40 in., and there are about 150 rainy days in a year. Jan. and Feb. are usually pleasant months. Sitka is in a wet situation, and it is said that more rain falls there than in any place not within the tropics. From 60 to 90 in. per year have been recorded, and the days of rain from 190 to 285. There is little of agriculture in the territory, though on the islands oats, barley, and root crops can be raised without great difficulty. The fisheries and the fur trade are the leading and almost only industries. In 1870, the product of salted codfish alone was 10,612,000 lbs. Seal-catching is still more important. The annual catch of fur seals throughout the world has been estimated at 160,000 animals, of which 100,000 are taken in Alaskan waters; the value for Alaska being estimated at \$1,260,000 per annum. The home of the seal, in the breeding and summer season, is on the islands of St. Paul and St. George, 300 m. from any other land. At the beginning of winter they migrate, and none are seen until the following spring. Laws have been enacted by congress to regulate the seal fisheries, in order to prevent the utter extinction of the animal. The fishery is now controlled by the Alaska company of California, who are not allowed to take more than 100,000 pelts per year; and they are to avoid killing females and very young male seals; while very old males are not worth killing. The company's right does not cover other fur-bearing animals. They employ about a dozen vessels and have 20 or more posts on the island and mainland. The United States government has a considerable income from the rent of the island and the tax on sealskins. No regular government had been established up to the autumn of 1879, but the people had chosen officers and formed a provisional government of their own.

The name of A. is an English corruption of Al-ak-shak, "the great land." The traveler by sea comes first to the great archipelago, the islands of which make a land-surface of 31,000 sq.m. Stretching along the Aleutian islands for 1500 m. are 61 volcanoes, ten of which are active; the grand Shishaldin, nearly 9000 ft. above the waves that wash its base, and Akuten, Makushin, and others, are belching out fire and smoke. The highest mountain is Mt. St. Elias, in the coast range, supposed to be nearly 18,000 ft. high, and by that estimate the loftiest point in North America. A. is one of the greatest glacier regions on the globe. From Bute inlet to Unimak pass every deep gulch has its glaciers, some of which are grander than any in the Alps. In one of the gulches of Mt. Fairweather is a glacier that extends to the sea, a distance of 50 m., and then breaks in a perpendicular wall of ice 300 ft. high and 8 m. broad. About 35 m. above Wrangel on the Stikine river, between two mountains 8000 ft. high, is a glacier 40 m. long and 4 or 5 wide, and from 500 to 1000 ft. deep. Opposite this mass of ice, just across the river, are large boiling springs. The Indians regard this glacier as the personification of a mighty ice-god who has issued from his mountain home invested with power before which all nature bows in submission. They describe him as crashing his way through the cañon where its glistening pinnacles bordered upon the domains of the river-god, and that after a conflict the ice-god conquered, and spanned the river's breadth so completely that the river-god was forced to crawl underneath. The Indians then sent their medicine man to see how this could be avoided. The answer came that if a noble chief and fair maiden would offer themselves a sacrifice by taking passage under the long, dark, winding ice arch, his anger would be appeased, and the river be allowed to go on its way undisturbed. When the two were found and adorned, their arms bound and seated in the canoe, the fatal journey was made, and the ice has never again attempted to cross the river. At one of these glaciers ships from California have anchored and taken on a cargo of ice. It is also a great hot and mineral spring region; medicinal springs abound in sufficient number and variety to treat the diseases of the whole race. Goreloi, one of these, is a vast smoking caldron, eighteen miles in circumference.

All the early navigators and explorers, from Cook to the present time, have spoken of the immense numbers of salmon, cod, halibut, mullet, ulicon, etc. There are no other such fisheries in the known world. A missionary (the Rev. Sheldon Jackson, from whose report some portions are here extracted) thus describes a fishing scene on the Nasse river: "I went up to their fishing grounds on the Nasse river, where some 5000 Indians had assembled. It is what is called their 'small fishing.' The salmon catch is at another time. These small fish are valuable for food, and also for oil. They come up for six weeks only, and with great regularity. The Nasse, where I visited it, was about a mile and a half wide, and the fish had come up in great quantities, so great that, with three nails upon a stick, an Indian would rake in a canoe full in a short time. Five thousand Indians were gathered together from British Columbia and Alaska, decked out in their strange fantastic costumes; faces painted red and black, and they had feathers on their heads and imitations of wild beasts on their dresses. Over the fish was an immense cloud of sea-gulls, so many and so thick, as they hovered about looking for fish, the sight resembled a heavy fall of snow. Over the gulls were eagles soaring about and watching their chance. After the small fish, had come up larger fish from the ocean. There was the halibut, the cod, the porpoise, and the fin-back whale; man life, fish life, and bird life—all under intense excitement. And all that animated life was to the heathen people a life of spirits. They paid court and worshiped the fish they were to assist in destroying; greeting them, 'You fish! you fish! You are alt chiefs, you are.' The Christian Indians

had their separate camps, where they had worship morning and evening, and kept the Sabbath."

The principal fur-bearing animals of A. are the fox, marten, mink, beaver, otter, lynx, black bear, and wolverine. There are also the coarser furs of the reindeer, mountain sheep, goat, wolf, muskrat, and ermine. The extent of the range and quality of the furs in that extensive northern region is conducive to a very valuable fur trade, in addition to which are the seal-fur fisheries, that since 1871 have yielded to the government an income of \$1,891,930. Besides the fisheries and furs are the valuable deposits of coal, copper, sulphur, petroleum, and amber, with gold and silver. The gold and silver, so far, have been found only in limited quantities. It is the great lumber region of the country. The forests of yellow cedar, white pine, hemlock, and balsam fir will supply the world when the valuable timber of Puget sound is exhausted. It has the great mountain peak of the country—St. Elias, 19,500 ft. high; and the Yukon, one of the largest rivers of the world.

A. is naturally divided into three great divisions: the Yukon division, comprised between the A. mountains and the Arctic ocean; the Aleutian district, comprising the A. peninsula and the Aleutian islands; and the Sitkan district, including all the mainland and adjacent islands s. of the peninsula. Each of these three great divisions has two climates, the coast climate and the interior climate; the latter being much severer than the former. The great gulf stream of the Pacific, known to geographers as the Japan current, strikes and divides on the western end of the Aleutian islands. A portion flows n. into Behring's sea, so that it is a remarkable fact that ice does not flow from the Arctic ocean southward through Behring's straits. The other portion sweeps southward and eastward, and makes the whole n.w. coast habitable, giving to southern A., on the coast and the adjacent islands, a winter climate milder than that of New York city. The Yukon district, bordering on the Arctic ocean, is remarkable for one thing. From 3 to 4 ft. below the surface there is a subsoil of frozen earth from 6 to 8 ft. deep. This phenomenon is ascribed to the want of drainage, together with a covering of moss that shields the ground from the hot suns of the Arctic summer; yet, notwithstanding this ice subsoil, during the summer months there is a luxuriant growth of vegetation. The great distinguishing feature of this district is the wonderful Yukon river, 2000 m. long, navigable for steamers for 1500 m. In some places on the lower Yukon one bank is invisible from the other. A thousand m. above its mouth it is, in places, 20 m. wide, including the intervening islands. It is one of the great rivers of the world, and upon its upper waters, within the arctic circle, is Fort Yukon, a post of the Hudson bay company. At this distant post, which tidings from the outside world reach only once a year, is a Scotch missionary. On its banks live thousands who know neither its outlet or its source, and yet, recognizing its greatness, proudly call themselves the "men of Yukon." Cape Prince of Wales and the island of Alton are the extreme western points of land in the United States—in long. 167° 59' 12".

Fort Wrangel, a village of 100 houses, is on the north-western coast of Wrangel island, at the mouth of the Stickine river. Owing to the extensive gold mines at Cassair, on the Stickine river, it has become the chief business center of A. The Cassair mines employ about 2000 men, who create considerable trade. For this trade Wrangel is at the end of ocean and commencement of river navigation. Five ocean vessels run between Portland and Wrangel, and Victoria and Wrangel, and four small river steamers run on the Stickine river between Wrangel and the mines. The coast of Wrangel and the mouth of Stickine river were first visited by the American ship *Atahualpa*, of Boston, in 1802, three years before Lewis and Clark descended the Columbia. The permanent pop. is about 100 whites and Russians and 500 Indians. Besides these there is a large winter pop. of miners, and a floating Indian pop. of from 500 to 700 more, there sometimes being from 2000 to 3000 Indians in the place. It is on the great highway of the Indians to and from the mines, also to their hunting and fishing. This makes it a central point for the establishment of a mission to the Indians, as parties from several large tribes are almost always in the village. The mission has a beautiful situation, overlooking the bay, the islands, and the Indian portion of the village, with its dwellings, its graves, and its emblems of heathenism. On the southern sweep of the shore of the bay stands the Indian portion of the village.

The native races in A. number about 25,000; Russians, 300 or 400; Americans and others, 500. The Indians can be divided into three great classes: the Innuit of Yukon district; the Aleutian and the Tuskis of the Sitka district. And these again are divided into tribes, settlements, and families. These are largely in a condition of degraded superstition, and liable to all the horrible cruelties of heathenism. The old, sick, and useless are put to death, with various cruelties and disgusting rites. The Indians are again subdivided into various families, each of which has its family badge. The badges are the whale, the porpoise, the eagle, the coon, the wolf, and the frog. These crests extend through different tribes, and their members have a closer relation to one another than the tribal connection. For instance, members of the same tribe may marry, but not members of the same badge. Thus, a wolf may not marry into the wolf family, but may into that of the whale. Upon all public occasions they are seated according to their rank. This rank is distinguished by the height of a pole erected in front of their houses. The greater the chief, the higher his pole. Some of these poles are over 100 ft. high.

The missionary relates how, upon one occasion, a head chief of the Nasse river Indians put up a pole higher than his rank would allow. The friends of the chief whose head he would thus step over made fight with guns, and the over-ambitious chief was shot in the arm, which led him to quickly shorten his stick. Their houses are from 25 to 40 ft. square, without a window, the only openings being a small door for entrance, and a hole in the roof for the escape of smoke. The door is 3 or 4 ft. above the ground level, and opens on the inside upon a broad platform, which extends around the four sides. This platform contains their rolls of blankets, bedding, and other stores. Some of the houses have a second platform inside the first, and a few steps lower. Then a few more steps down brings to the inside square on the ground floor, which is also planked, with the exception of about four ft. square in the center, where the fire is built on the ground. Some few have a small inside room, looking as if it were a portion of the cabin of a wrecked vessel. The walls, and frequently roofs, are made of cypress plank, from 2 to 5 ft. wide, and 2 to 3 in. thick. These planks are made by first splitting the trees into great planks, then smoothing down the planks with a small adze. In front of their leading houses and at their burial places are sometimes immense timbers covered with carvings. These are the genealogical records of the family. The child usually takes the totem of the mother. For instance, at the bottom of the post may be the carving of a whale, over that a fox, a porpoise, and an eagle—signifying that the great-grandfather of the present occupant of the house, on his mother's side, belonged to the whale family, the grandfather to the fox family, the father to the porpoise, and he himself to the eagle family. These standards are from 2 to 5 ft. in diameter, and often over 60 ft. in height, and sometimes cost from \$1000 to \$2000. Formerly the entrance to the house was a hole through this standard, but latterly they are commencing to have regular doors hung on hinges. Among the Stickines these badge trees or totems are usually at one side of the door.

A. is celebrated for its canoes. Some of the largest of these canoes are from 60 to 75 ft. long and 8 to 10 ft. wide, and will carry 100 people. The operation of making them is thus described: "Having selected a sound tree, and cut it the desired length, the outside is first shaped, then the tree is hollowed out till the shell is of proper thickness; this is done with a tool resembling a grubbing-hoe, or narrow adze with a short handle. It is then filled with water, which is heated by throwing in hot stones. The canoe is then covered with a canvas to keep the steam in. This softens the timber, and the sides are distended by cross-sticks to the desired breadth at the center, and tapering towards the ends in lines of beautiful symmetry. It is finished off with a highly ornamental figure-head, and the bulwarks strengthened by a fancy covering board."

Polygamy, with all its attendant evils, is common among the Kaviaks. Their wives are often sisters. Sometimes a man's own mother or daughter is among his wives. If a man's wife bears him only daughters, he continues to take other wives until he has sons. One of the Nasse chiefs is said to have had forty wives. After marriage, women are practically slaves of their husbands. Sometimes they are traded off by the husband for something he may desire. In some sections all the work but hunting and fighting falls upon the women—even the boys transferring their loads and work to their sisters. As though their ordinary condition were not bad enough, the majority of the slaves are women. The men captured in war are usually killed, or reserved for torture; but the women are kept as beasts of burden, and often treated with great inhumanity. The master's power over them is unlimited. He can torture or put them to death at will. Sometimes, upon the death of the master, one or more of them are put to death, that he may have some one to wait upon him in the next world. The bodies of the dead are disjointed and burned. Dead slaves are cast into the sea. They believe in the transmigration of souls from one body to another, but not to animals. Those whose bodies are burned are supposed to be warm in the next world, and the others cold. If slaves are sacrificed at their burial it is thought that the owners are relieved from work in the next world. Among the Nehaunes and Talcolins, when a man dies, his widow is compelled to ascend the burning funeral pile, throw herself upon the body, and remain there until the hair is burned from her head, and she is almost suffocated. She is then allowed to stagger from the pile, but must frequently thrust her hand through the flames and place it upon his bosom, to show her continued devotion. Finally the ashes are gathered up and placed in a little sack, which the widow carries on her person for two years. During this period of mourning she is clothed in rags, and treated as a slave. Among the Chuckees the old and feeble are sometimes killed. This is done by placing a rope around the neck, and dragging them over the stones. If this does not kill, then the body is stoned, or speared, and left to be eaten by the dogs. Occasionally the old ask to be killed. Then they are taken, stupefied with drugs, and, in the midst of various incantations, bled to death. In some sections where wood is scarce, the bodies of women are not considered worth the wood that would be consumed in the burning; and they are either cast out, to be consumed by the dogs, foxes, and crows, or cast into the sea as food for fishes. A summary cure for crying babies is to take them to the sea-shore and hold them in the water until they cease crying. As soon as they can walk, children are bathed in the sea daily, and they learn to swim as soon as they do to walk.

Sorcery is prevalent. The words and actions of the shaman (sorcerer) are considered infallible. The office is often hereditary, the son inheriting from the father the various

paraphernalia of drum, rattles, masks, charms, etc. The honor of the shaman depends upon the number of spirits which he can control. He has a separate mask, songs, and dances for each. His hair is never to be cut. When a shaman dies his body is left for a day in each of the four corners of his room; on the fifth day it is carried out, dressed in the costume of his order, and deposited in a small burial house. His body is not burned. The Indians are held in abject fear of the conjurers or medicine men. Some of the scenes often witnessed on that coast are thus depicted by a missionary: "An old chief, in cold blood, ordered a slave to be dragged to the beach, murdered, and thrown into the water. His orders were quickly obeyed. The victim was a poor woman. Two or three reasons were assigned for this foul act. One is that it is to take away the disgrace attached to his daughter, who has been suffering for some time with a wound in the arm. Another report is that he does not expect his daughter to recover, so he has killed this slave in order that she may prepare for the coming of his daughter into the unseen world. Immediately afterwards, crowds of people came running out of the houses near to where the corpse was thrown, and forming themselves into groups at a good distance away, from fear of what was to follow. Presently two bands of furious wretches appeared, each headed by a man in a state of nudity. They gave vent to the most unearthly sounds, and the naked men made themselves look as unearthly as possible, proceeding in a creeping kind of stoop, and stepping like two proud horses, at the same time shooting forward each arm alternately, which they held out at full length for a little time in a most defiant manner. Besides this, the continual jerking of their heads back, causing their long black hair to twist about, added much to their savage appearance. For some time they pretended to be seeking for the body, and the instant they came where it lay they commenced screaming and rushing around it like so many angry wolves. Finally they seized it, dragged it out of the water, and laid it on the beach, where they commenced tearing it to pieces with their teeth. The two bands of men immediately surrounded them and so hid their horrid work. In a few minutes the crowd broke again, when each of the naked leaders appeared with half of the body in his hands. Separating a few yards they commenced, with horrid yells, their still more horrid feast of eating the raw dead body. The two bands of men belonged to that class called "medicine men." Among these "medicine men" there are three general divisions: those who eat human bodies, the dog-eaters, and those who have no custom of the kind. Early in the morning the pupils would be out on the beach, or on the rocks, in a state of nudity. Each had a place in front of his own tribe; nor did intense cold interfere in the slightest degree. After the poor creature had crept about, jerking his head and screaming for some time, a party of men would rush out, and after surrounding him, would commence singing. The dog-eating party occasionally carried a dead dog to their pupil, who forthwith commenced to tear it in the most doglike manner. The party of attendants kept up a low growling noise, or a whoop, seconded by a screeching noise made from an instrument which they believe to be the abode of a spirit. Of all these parties none are so much dreaded as the cannibals. One morning I was called to witness a stir in the camp which had been caused by this set. When I reached the gallery I saw hundreds of Tsimshians sitting in their canoes, which they had just pushed away from the beach. I was told that the cannibal party was in search of a body to devour, and if they failed to find a dead one, it was probable that they would seize the first living one that came in their way; so that all the people living near the cannibals' house had taken to their canoes to escape being torn to pieces."

**ALATER'NUS**, according to some, a genus of plants of the natural order *rharnaceæ* (q. v.), akin to *rharnnus* (see BUCKTHORN); but more generally regarded as a sub-genus of *rharnnus*, consisting of evergreen shrubs, of which the best known is *rharnnus A.*, or *A. phyllirea*, a large shrub, densely branched, with shining alternate leaves, which are more or less ovate. The flowers are dioecious, racemed, numerous, and small, much sought after by bees. This shrub is abundant in the s. of Europe, and is often planted in town-gardens in England to conceal walls and other objects, being of rapid growth, and not easily injured by smoke. The bark and wood have been used in dyeing.

**ALA'TRI**, a t. in Italy, 6 m. n. of Frosinone. It is the see of a bishop, and shows considerable remains of Pelasgian antiquity. Pop. of commune, 11,370. The ancient name was Alatrium.

**ALAU'DA**, a genus of birds including larks, chiefly noted as song birds. They are found in all countries, but abound especially in Europe. They are birds of passage, and some of the genus are esteemed for the table.

**ALAU'SI**, a t. of the republic of Ecuador, South America, in the province of Chimborazo, 70 m. e. from Guayaquil, at an elevation of 7980 ft. above the sea, in a valley of the Andes, on the river Alausi, which flows into the gulf of Guayaquil. The valley of the Alausi is extremely fertile, producing sugar, grain, and fruits. There are manufactures of woolen and cotton cloth in the t. Pop. 6000.

**A'LAVA**, one of the provinces of Spain, 1200 sq. m. Its surface is mountainous, especially in the n., where the Pyrenees form the natural boundary. It is separated from Logrino by the Ebro; the Zadowa and the Ayadak are the other rivers. The soil is fertile, producing wheat, barley, maize, flax, hemp, and fruit. The mountains are covered

with forests of oak, beech, chestnut, etc., and contain iron, copper, lead, and marble. Pop. 70,102,494. Capital, Vittoria.

**ALAVA**, DON MIGUEL RICARDO D', a Spanish general, b. at Vittoria, in 1771, of a noble family, in the province of Alava. He entered the navy in early life; but afterwards changed to the land-service. After the abdication of Ferdinand VII., he was for a time a zealous partisan of France; however, in 1811, when he saw the fortunes of Joseph beginning to wane, he abandoned the cause of this prince, to embrace that of the national party, and accepted the office of Spanish commissary on the staff of Wellington. He gained the confidence of this general, and from this time manifested the strongest predilection for England and English institutions. The war of independence furnished him with numerous occasions of distinguishing himself. After the restoration of the king, however, he was arrested, on the suspicion of entertaining liberal opinions; but on the application of his uncle, Ethenard, the inquisitor, seconded by the influence of Wellington, he was not only liberated, but appointed ambassador to the Hague. He returned to Spain in 1820, after the revolution; became captain-general of Aragon, made himself conspicuous among the Exaltados, and figured in the ranks of the militia on occasion of the revolt of the royal guard at Madrid, July 7, 1822. In the cortes assembled at Seville in 1823, he voted for the suspension of the royal authority, and took part in the negotiations carried on with the duke of Angoulême, at Cadiz. The re-establishment of absolute monarchy in the peninsula drove him, as a political refugee, to Brussels and England, till, at the death of Ferdinand, he was recalled by the regent, Maria Christina. In 1834, he was appointed Spanish ambassador to London; and towards the end of 1835, he undertook a mission to Paris. Under the administration of Isturiz, A. showed himself as zealous for the moderate system as he had been for the preceding one, and advocated the French intervention, which he had opposed during his embassy to London. After the insurrection of La Granja, he refused to swear to the constitution of 1812, declaring that he was tired of constantly taking new oaths; he gave in his resignation accordingly, and retired to France, where he died in 1843.

**ALAY**, a Turkish ceremony on the assembling of the forces at the breaking out of a war; essentially a public display of the sacred standard of Mohammed, which may be looked upon only by Moslems and touched only by emirs. Once when the standard had been shown, the rule was forgotten, but when remembered all the Christians who had innocently looked at the banner were slaughtered.

**ALBA** (ancient *Alba Pompeia*), a very ancient city of north Italy, in the province of Cuneo, on the right bank of the Tanaro, 31 m. s.e. from Turin. It is situated in a plain surrounded by hills. The neighborhood produces much wine and silk, besides corn, oil, and fruits. The town has an extensive trade in cattle. It is an episcopal seat; the cathedral was founded in 1486. Pop. 6600.

**ALBA**, or **ALVA**, FERDINAND ALVAREZ VON TOLEDO, Duke of, prime-minister, and gen. of the Spanish armies under Charles V. and Philip II., was b. in 1508, of one of the most illustrious families of Spain. He was educated under the eye of his grandfather, who instructed him in the arts of war and of government. He fought, while yet a youth, at the battle of Pavia, and had the custody of Francis I. while a prisoner. He commanded under Charles V. of Hungary, was present at the siege of Tunis, and accompanied the expedition against Algiers. He defended Perpignan against the dauphin, distinguished himself in Navarre and Catalonia, and was in consequence created duke of A. His cautiousness and his taste for political intrigue afforded as yet no very high evidence of his military talents; and even Charles V., whom he counseled, when in Hungary, to build a bridge of gold for the Turks, rather than hazard a decisive battle, seems to have intrusted him with the command rather as matter of personal favor than recognition of his abilities. His pride was hurt at the low estimation in which he was held; and his real genius began to show itself. The victory which Charles V. gained at Mühlberg over John Frederic, elector of Saxony, in 1547, was due to the able generalship of the duke of A. Under his influence, as president of the council of war, the captive elector was condemned to death, and it was entirely against his wish that the emperor commuted the sentence. He took part under the emperor in the expedition against Henry II., king of France, who had taken possession of Metz; but here his exertions, as well as those of the emperor, proved unavailing. He was more fortunate in Italy against the combined armies of the pope and the French king, which he repeatedly defeated during the campaign of 1555. After the abdication of the emperor Charles V. in 1556, he continued to hold the command of the army, and overran the states of the church, which, after the retreat of the French army in 1557, lay entirely at his mercy. He was obliged, however, by the command of Philip II., to conclude a peace with pope Paul IV., and restore all his conquests. Being recalled from Italy, he appeared in 1559 at the court of France, with which Spain had become reconciled by the peace of Château-Cambresis, April 3, 1559; and as proxy for his sovereign, espoused Elizabeth, Henry II.'s daughter.

When the inhabitants of the Netherlands, who had been accustomed to freedom, revolted against the tyranny of Spain, and especially against the hated inquisition, the duke of A.'s counsel was to suppress the insurrection forcibly and with rigor. The king accordingly committed the matter to his hands, and sent him to the Netherlands, 1567, with unlimited power and a large military force. His first step on arriving was to estab-

lish what was called the "bloody council," in which he himself at first presided, and over which he afterwards appointed the sanguinary don Juan de Vargas. This tribunal condemned all without distinction whose opinions appeared dubious, or whose wealth excited jealousy. The present and the absent, the living and the dead, were subjected alike to trial, and their property confiscated by the council. A number of the merchants and mechanics emigrated to England; above 100,000 abandoned their native country, and many others enlisted under the banners of the proscribed princes, Louis and William of Orange. A., rendered still more savage by a defeat which befell his lieutenant, the duke of Aramburg, put to death the counts Egmont and Horn on the scaffold. He afterwards defeated prince Louis, and compelled William of Orange to retire to Germany; upon which he entered Brussels in the greatest triumph on the 22d Dec., 1568. The pope presented him with a consecrated hat and sword, as defender of the Catholic faith; an honor which, having been hitherto conferred only on crowned heads, increased his insolence to the highest degree. He caused a statue to be cast, in which he was represented as trampling under foot two human figures, representing the nobles and people of the Netherlands; and this he set up in Antwerp. His executioners shed more blood than his soldiers; and none now withstood his arms except Holland and Zealand. But these provinces continually renewed their efforts against him, and succeeded in destroying the fleet which had been equipped by his orders. This disaster, and perhaps still more the apprehension that he might lose the king's favor, induced him to request that he might be recalled. Philip gladly acceded, as he perceived that the obstinacy of the rebels was only increased by these cruelties, and he was desirous of trying the effect of milder measures. A. accordingly resigned the command of the troops to don Louis de Requesens, and, Dec. 18, 1573, left the country, in which, as he himself boasted, he had executed 18,000 men. The war which he had kindled burned for 68 years, and cost Spain \$800,000,000, her finest troops, and the loss of seven of the richest provinces of the Netherlands.

A. was received at Madrid with the highest distinction, but did not long enjoy his former consideration. Don Frederic, one of his sons, having seduced one of the queen's ladies of honor under promise of marriage, and being arrested on this account, the father assisted him to escape, and, in opposition to the desire of the king, united him in marriage to one of his relatives. He was in consequence banished from the court to his castle of Uzeda, where he lived two years. But now the troubles in Portugal, the crown of which Philip claimed as his hereditary right, induced the king to draw A. anew from his retreat. The duke accordingly led an army into Portugal, and drove out don Antonio, who, as grandson of John III., had taken possession of the throne. The whole country was speedily conquered (1581); and A., with his accustomed cruelty and rapacity, seized the treasures of the capital himself, while he allowed the soldiers to plunder without mercy the suburbs and the surrounding country. Philip, dissatisfied with these proceedings, desired to have an investigation of the conduct of the duke; but the haughty bearing of the latter, and the fear of a revolt, induced him to abandon it. A. d. at Lisbon, Dec. 11, 1582, at the age of 74. He had a fine countenance, with a haughty air and a robust frame; he slept little, while he both labored and wrote much. It has been said of him, that during 60 years of military service he never lost a battle, and never allowed himself to be surprised.

**ALBACE TÉ**, a t. of Spain, capital of the province of the same name, in Murcia, 138 m. s.e. from Madrid, and a station on the railway from Madrid to Alicante. It stands in a fertile but treeless plain, is built with some degree of regularity, and contains a number of squares and many good houses. It is a place of considerable trade, and has great cattle-fairs in Sept. It is noted in Spain for the manufacture of knives and other steel goods, which, however, are very inferior to those of Sheffield. Pop. 15,150.—The province of Albacete is partly formed from the former kingdom of Murcia, and partly from New Castile. It is generally hilly, and in some parts mountainous, some of its mountains attaining an altitude of 5000 feet; but it contains also rich plains and fertile valleys. Agriculture is in a more advanced state than in most parts of Spain; corn and wine are largely produced, as also oil, hemp, tobacco, saffron, fruits of various kinds, and honey. Great numbers of sheep, goats, oxen, horses, mules, and asses are reared. The mineral wealth of the province appears to be considerable, but is not turned to much account. The area of the province is 5966 sq.m.; pop. '70, 220,973.

**ALBA LONGA**, one of the most ancient cities of Italy, situated on the rocky ridge that runs along the eastern shore of the Alban lake, between the lake and the Alban mount. See **ALBANO**. According to legendary history, it was built by Ascanius, the son of Æneas, about 300 years before the foundation of Rome, which is represented as a colony of A. Notwithstanding this, the Romans, under Tullus Hostilius, destroyed the city, and removed the inhabitants to Rome. It seems certain that A. was an important city long before the existence of Rome, and the head of a confederation of Latin towns, and that when it was destroyed, many of its inhabitants settled at Rome. Some traces of its walls are yet to be seen.

**ALBAN, SAINT**, the first martyr of Britain, was b. at Verulam, in the 3d c., and after having long lived as a heathen, was converted to Christianity, but put to death at the commencement of Diocletian's persecution of the Christians. His anniversary is

celebrated on the 22d June. The t. of St. Albans (q.v.), which bears his name, is believed to stand on the site of his birthplace, or the scene of his martyrdom.

**ALBANEN'SES**, a division of the sect of Catharists in the 11th c., holding the Gnostic doctrine of two principles, good and evil. They denied the divinity of Christ, and rejected the story of his death, resurrection, and ascension; they denied the resurrection of the dead; and believed the judgment day was passed, and hell's torments are suffered in this life; they also denied free will and original sin, and held that man can impart the Holy Spirit to himself.

**ALBANI** is the name of a rich and celebrated family of Rome, who came originally from Albania in the 16th c., and settled first at Urbino. The great influence of the family dates from the accession (1700) of Giovanni Francesco A. to the papal throne as Clemens XI. It has since furnished a succession of cardinals. It was cardinal Alessandro A. (b. 1692, d. 1779) who formed the famous collection of objects of art in the **VILLA A.**, outside the Porta Salaria at Rome. It is still a rich collection, although part of it was carried off by the French. The pieces taken away were restored in 1815; but the then possessor being unable to pay for their removal to Rome, sold them to the king of Bavaria.

**ALBANI**, FRANCESCO, a painter of the Bolognese school of the time of the Caracci; b. at Bologna 1578, and d. there in 1660. He studied, along with Guido Reni, first under Calvert, and afterwards under the Caracci. He has painted above fifty altarpieces, worthy of the Caracci school; but his inclination lay more to the representation of scenes of a playful and pastoral or of a mythical kind, and of this nature are the greater part of his pieces. He had by his second wife a family of twelve children of extraordinary beauty, in whom he found exquisite models for his Venuses, Galateas, and angels' heads with the disadvantage, however, of imparting a certain uniformity to the countenances of his figures. His representation of the four seasons, so often imitated, gained him great renown. A.'s chief defect lies in the expression of life and feeling.

**ALBANIA** forms the s.w. district of European Turkey, and occupies the w. of the Balkan peninsula, from Bosnia and Montenegro to the Greek frontiers, which the Berlin congress of 1878 recommended should be advanced to the Kalamas river. Upper or northern Albania corresponds to the Illyria of the Romans, and lower or southern Albania corresponds to the ancient Epirus. On the east boundary, forming the watershed of the peninsula, rises the range of the Bora-dagh and the Pindus. The first detaches itself from the wild masses of the Tshar-dagh (dagh in Turkish means *mountain*) and Argentaro mountains; and west of it lie parallel chains, inclosing on the one side long elevated valleys, and sinking on the other in terraces down to level strips along the coast, consisting mostly of unhealthy swamps and lagoons. Pindus, to the s., is also flanked by isolated basins or hollows, whose western edges pass into the jagged and thick-wooded Ebirotic highlands. These highlands advance to the sea, forming steep rocky coasts; one promontory, the Acroceraunian, projecting in cape Linguetta far into the sea, reaches a height of 4000 to 5000 ft.

The chief rivers are the Bojana, the Drin, the Skombi, Ergent, Vojussa, Glykys or Acheron (which follows for some distance a subterranean channel, and on reappearing is called Mauropotamos), the Arta, and the upper course of the Aspropotamos. Among the lakes, those of Bojana, Ochri, and Janina are the most important.

A fine climate, the heat of which is tempered by high mountains and the proximity of the sea, and a favorable soil, would seem to invite the inhabitants to agriculture; but for the most part in vain. In the north little or nothing is cultivated but maize; in the moist valleys, a little rice and barley are produced; but the mountain-terraces are used as pastures for numerous herds of cattle and sheep. In Epirus there is more variety. Here the slopes of the lower valleys are covered with olives, fruit and mulberry trees, intermixed with patches of vines and maize, while the densely wooded mountain-ridges furnish valuable supplies of timber. The plateau of Janina yields abundance of grain; and in the valleys opening to the s. the finer fruits are produced, along with maize, rice, and wheat. Even cotton and indigo might be profitably cultivated in the moist valleys; but in its present wretched condition the country can barely support its scanty population.

The inhabitants, estimated at about 1,000,000, form a peculiar people, the Albanians or Arnauts; they call themselves Skypetars. They are descendants of the ancient Illyrians, mixed with Greeks and Slaves, and not to be confounded with the Albani that live on the Caspian sea. The Albanians are half-civilized mountaineers, frank to a friend, vindictive to an enemy. They are constantly under arms, and are more devoted to robbery and piracy than to cattle-feeding and agriculture. They live in perpetual anarchy, every village being at war with its neighbor, and even the several quarters of the same town carrying on mutual hostilities. Many of them serve as mercenaries in other countries, and they form the best soldiers of the Turkish army. At one time the Albanians were all Christians; after the death of their last chief, the hero Scanderbeg, and their subjugation by the Turks, a large part became Mohammedans, who distinguished themselves by cruelty and treachery towards the tribes that remained true to their old faith. The steep valleys of the Acheron in the s., forming the district of

Suli, are inhabited by a powerful tribe, the Suliotes, who till their fields sword in hand, and conceal their harvests in the earth. They made themselves famous by their long resistance to Ali Pasha. In the n., between the Black Drin and the sea, is the country or circle of the Mirdites, i.e., the brave, who are always ready with weapons in their hands to defend their freedom and their religion—the Roman Catholic. A. is officially divided between the vilayets of Scutari and Janina. The divisions chiefly recognized by the Albanians themselves are the varieties of the native tribes, which col. Leake divides into the Ghegides, whose chief towns are Dulcigno, Scutaria, and Durazzo; the Toskides, in Berat and Elbasan; the Liapë, in the mountains between the Toske and Delvino; and the Tsami, in the s. The chief towns are the ports of Durazzo, Avlona, Prevesa, and Farga; and Scutari, Berat, Argyro Castro, Arta, Akhrida, and Joannina.

ALBA'NIA, in ancient geography, a country in Asia on the w. side of the Caspian sea and n. of Armenia, corresponding with the modern Daghestan, Schirvan, and Laghistan. It is mostly alluvial, made by the river Cyrus, and is very fertile. The ancient Albanians were described as tall, very strong, and of graceful appearance. They were nomads, and never went into agriculture or trade. The Romans under Pompey first encountered them (65 B.C.) and found a force of 60,000 infantry and 22,000 cavalry contesting the road. Pompey secured a nominal submission, but they continued practically independent.

ALBA'NO, a t. of Italy, about 18 m. from Rome, on the declivity of the lava-walls which encompass the lake Albano. It is the seat of a bishop, numbers 5000 inhabitants, and is surrounded with handsome mansions of the wealthier Romans. It is on the opposite side of the lake from where Alba Longa stood, and owed its origin to the villas of ancient Roman magnates, such as Pompeius, Domitian, and Clodius. A valuable wine is produced in the environs. Near the town, on the old Appian way, are found the remains of an amphitheatre, and a sepulchre of Etruscan architecture.

THE ALBAN LAKE, or lago di Castello, is formed in the basin of an extinct volcano, and has a circumference of 6 m., with the enormous depth of more than 1000 ft. Its elevation is nearly 1000 ft. above the sea-level. While the Romans were at war with the Volentes (390 B.C.), this lake rose to an extraordinary height in the heat of summer, and without any apparent cause. Etruscan diviners declared that the conquest of Veii depended upon letting off the waters of the lake. Stimulated by this, the Romans, under the direction of the Etruscans, opened an emissary or tunnel through the lava-wall which bounds it. In the execution of this work they acquired the art of mining, which they now applied to undermine the walls of Veii. The tunnel, which still remains, and still fulfills its ancient office, is  $1\frac{1}{2}$  m. in length, with a height of 7 ft. and a width of 4 ft. On the eastern bank of the lake, rises monte Cavo, the ancient Mt. Albanus, 3000 ft. high, affording an extensive and magnificent view from its summit. Upon it once stood the magnificent temple of Jupiter Latialis, which was approached by a paved way, for the ascent of the solemn processions of the Latin confederation (*Feria Latina*), and for the ovations of Roman generals. The road remains, in great part, perfect to this day.

The Albano stone, called Peperino, was much used in Roman buildings. It is a kind of volcanic tufa, of an ash-color, and is still quarried extensively at A.

AL'BANS, ST., an ancient borough in Hertfordshire, situated on the top and northern side of a picturesque hill, 21 m. n.w. from London. The Ver, a small tributary of the Colne, separates it from the site of the ancient Verulamium (Verulam), an important station in the time of the Romans, and the scene of a terrible slaughter in the insurrection under Boadicea. In honor of St. Alban, said to have suffered martyrdom here in 297, a Benedictine monastery was founded by Offa, king of Mercia, in 796. The foundation of the t. is supposed to be due to Ulsig (or Ulsin), who was abbot about 150 years later. Two battles were fought near St. A. during the wars of the roses, in 1455 and 1461. In the first Henry VI. became a captive; in the other, he was set at liberty by his brave queen, Margaret of Anjou. The old abbey-church, restored in 1875 by Sir Gilbert Scott, is a cruciform building of irregular architecture, 547 ft. in length by 206 in breadth, with an embattled tower 146 ft. high. The abbot of St. A. had a seat in the house of peers, and had precedence of all other English abbots. In St. Michael's church is to be seen a monument to the memory of the great Bacon, who bore the titles of baron Verulam and viscount St. A. More recently, the Beauclerk family have taken from this place the title of duke, and the Grimston family that of earl. The borough was disfranchised in 1852 for bribery. Pop. '71, 8293, many of whom are employed in straw-plaiting. St. A. has recently been made the center of a new diocese of the church of England; its first bishop having been enthroned in June, 1877.

ALBANS, ST., in Vermont. See ST. ALBANS.

ALBANY, or ALBAINN, an ancient name for the highlands of Scotland, and retained in some degree of use down to our own day. Connected with it is the term *Abiones*, applied to the inhabitants of the entire British island in Festus Avienus's account of the voyage of Hamilcar, the Carthaginian, in the 5th c. B.C.; also the term *Albion*, which appears as the name of the island in Aristotle's *Treatise of the World*. It may, indeed, be pretty safely assumed that Albion or Albany was the original name of Britain among its Celtic population; and that it only became restricted to the n.w. provinces of Scotland

when the Celts had for the most part become confined to the same region. Albainn means a country of heights (the root being *alb*, or *alp*, a height); and it is remarkable to find Albania also a mountainous country. The modern use of the name A. may be said to have taken its rise in an act of a Scottish council held at Scone in June, 1398, when the title of duke of A. was conferred on the brother of king Robert III., then acting as regent of the kingdom. The title, being forfeited in the son of the first holder, was afterwards conferred on Alexander, second son of king James II., in the person of whose son, John, it became extinct in 1536. Subsequently it was conferred in succession on Henry lord Darnley, on Charles I. in infancy, on James II. in infancy, and (as a British title) on Frederick, second son of George III. The unfortunate prince Charles Stuart, in his latter years, assumed the appellation of Count A. as an incognito title, and gave the title of duchess of A. to his legitimated daughter.

**ALBANY**, a co. in e. N. Y., on the w. side of the Hudson river, 482 sq. m.; pop. 75,147,530. The surface is hilly and mountainous in the s.; soil good in the valleys, but on high ground sandy and poor. Marl, gypsum, magnesian limestone, and iron are found. Several railroads intersect it, including the great New York Central, the first section of which, from A. to Schenectady, was the earliest railroad in the state. The staple products are wool, grain, hay, milk, butter, and cheese. Co. seat, Albany, which is also the capital of the state.

**ALBANY**, a co. in Wyoming territory on the Colorado and the n. fork of the Platte, and drained by the Laramie. It is in the Black hills region, and mountainous, Laramie peak being 10,000 ft. above sea-level. The Union Pacific railroad runs through the co. Cattle and wool are the staples. Co. seat, Laramie.

**ALBANY**, the capital of New York, United States, is situated on the w. bank of the Hudson river, 145 m. n. of New York city, in lat. 42° 39' n., and long. 73° 45' w. After Jamestown, Virginia, and St. Augustine in Florida, it is the oldest town in the Union, having been founded by the Dutch in 1623, though it did not receive its present appellation until 1664, when it came into the possession of the English, and was so named in honor of the duke of York and Albany. It is situated in the midst of a fertile and well-cultivated country, and is one of the most flourishing cities in the states, being the chief emporium for the transit-trade of the coast towns with those of the n. and n.w. It is advantageously built for commerce, being situated at the point where the Erie and Champlain canals join the Hudson. It is also the center in which a number of railways meet, connecting it with New York, Buffalo, Boston, and other important cities. One of the most important articles in its commerce is timber. It is one of the largest timber-markets in the world; receiving yearly many millions of cubic ft., valued at over \$7,000,000. In the year 1873, the total number of vessels which belonged to the port was 586, and their tonnage amounted to 68,682 tons; of this number of vessels, 101 were steamers. Viewed from some parts of the river, A. has a picturesque and imposing appearance. Its streets are not generally very regular, or its houses very elegant; nevertheless, it contains some of the most splendid edifices in the Union. The capitol, erected at great cost, in the renaissance style, is one of the finest public buildings in America. The city hall is built of marble, and ornamented with a gilded dome. A. is distinguished for its educational and literary institutions. The university, incorporated in 1852, has for its aim the discipline of the American youth in the most important branches of practical science. The medical college, founded in 1839, has one of the best museums in the states, and is otherwise amply furnished with the means of instruction. There is likewise a large number of public schools.

**ALBANY** (*ante*), the capital of New York, on the w. bank of the Hudson river, 145 m. n. of New York city, in lat. 42° 39' 49" n., and long. 73° 44' 33" w.; pop. 80,90,713. It was occupied by the Dutch as a trading-post with the Indians in 1614. Fort Orange was erected in 1628. The settlement was first called Beverwyck, and afterwards Williamstadt. In 1664 it received the name of A. in honor of the duke of York and Albany. It was incorporated as a city in 1686, and became the capital of the state in 1797. In 1806 the corner-stone of the capitol was laid. This building will be removed when the new capitol, the corner-stone of which was laid in 1871, is finished. The new capitol, built of granite, is 390 ft. by 290, covering more than three acres. It will be one of the largest and most expensive buildings of the kind in the country. The other public buildings belonging to the state are the state library, containing more than 90,000 volumes and various interesting revolutionary relics; the state hall, accommodating certain departments of the government; the geological hall, containing extensive collections in geology and natural history; and the state normal school. A. has connections with the e. by the Albany and Boston and the Troy and Boston railroads; with the n. and Canada by the Rensselaer and Saratoga; with the w. and s. by the Harlem, Hudson River, and New York Central, and with the s.w. by the Albany and Susquehanna railroads. It has water communication with the n. by the Champlain canal, with the w. by the Erie canal, and with the s. by the Hudson river. There are two bridges over the Hudson, built by the Hudson River and New York Central railroads. A. is supplied with water in part from an artificial lake a few miles w. of the city, and in part with water pumped from the Hudson. The city has a well organized system of public schools, with a well equipped high school at the head. The A. academy is one of the oldest and best academies in the state, and has a building of rare

architectural beauty. The normal school, established in 1844, has sent out more than 2000 graduates. The medical college, organized in 1839, has had connected with it 4492 students, of whom 1455 have graduated (1880). The law school was established in 1851, and has been well attended. The Dudley observatory, dedicated in 1856, has a 13-inch equatorial instrument, a meridian circle, numerous meteorological instruments, and a remarkable calculating and printing engine. Both the medical and law schools, at first independent institutions, now in connection with Union college, constitute Union university. There are forty-seven places of worship: Presbyterian, 9; Roman Catholic, 7; Methodist, 6; Baptist, 6; Episcopal, 5; Lutheran, 4; Reformed, 4; Jewish, 3; Friends', 1; Congregational, 1; Universalist, 1. There are two public hospitals. The penitentiary has always been self-supporting. On the w. side of the city there is a beautiful public park containing 250 acres. The cemetery, 4 m. distant from the city, contains 230 acres. From its numerous railway and water connections A. has become the center of a large amount of business, of which the most important branches are the stove manufacture and the lumber trade.

ALBANY, a maritime division of Cape Colony, Africa, about 450 m.e. of Cape Town; 65 m. long, by 30 or 40 wide; traversed by great Fish river. It produces maize, barley and cotton. Pop. '65, 16,264. Capital, Grahamstown.

ALBANY, LOUISA-MARIA-CAROLINE, also ALOYSIA, Countess of, wife of the unfortunate prince Charles Edward (q.v.), grandson of James II. of England. She was the daughter of prince Gustavus Adolphus of Stolberg-Gedern, who fell in the battle of Leuthen in 1757. This lady was b. in 1753, and, during her married life, bore the name of the countess of A. She had no children; her marriage proved an unhappy one, and in order to escape from the ill-usage of her husband, who lived in a state of continual drunkenness, she sought refuge in a nunnery, 1780. At the death of the prince in 1788, the court of France allowed her an annual pension of 60,000 livres. She outlived the house of the Stuarts, which became extinct at the death of her brother-in-law, the cardinal of York, in 1807. She died at Florence, which was her usual place of residence, on the 29th of Jan., 1824. Her name and her misfortunes have been transmitted to posterity through the works and autobiography of Alfieri (q.v.), to whom she was privately married. Their remains repose in the same tomb in the church of Santa Croce at Florence, between the tombs of Macchiavelli and Michael Angelo.

ALBATEG'NIL, d. 929; an Arabian astronomer, whose proper name was MOHAMMED IBN JABIR IBN SENAN ABU ABDILLAH, named from Batan in Mesopotamia, of which t. he is said to have been chief. His astronomical observations extended over more than 60 years, and were conducted on the Euphrates and at Antioch in Syria. His chief work, *The Science of the Stars*, was published in 1537 from the original manuscript in the Vatican library. He recast and improved Ptolemy's tables, and came as near to the obliquity of the ecliptic as 23° 35'. His tropical year was nearer than Ptolemy's, being only 2 m. 26 s. short. The Alphonsine tables of the moon's motion were founded upon his observation, and he first substituted sines for chords, and also introduced into trigonometry the use of tangents and versed sines. He was called "The Arabian Ptolemy," and was held to be first of Arabian astronomers.

ALBATROSS (*Diomedea*), a genus of web-footed birds of the family of the *Laridae*, nearly allied to gulls and petrels. Their feet have no hind-toe nor claw; they have a large strong beak—the upper mandible, with strongly marked sutures, and a hooked point. The common A. (*D. exulans*), also called the wandering A., is the largest of web-footed birds, the spread of wing being sometimes 12 ft., and the weight 20 lbs. or upwards. The wings are, however, narrow in proportion to their length. This bird is often seen at a great distance from land, and abounds in the southern seas, particularly near the cape of Good Hope, whence sailors sometimes call it the cape sheep. It often approaches very near to vessels, and is one of the objects of interest which present themselves to voyagers far away from land, particularly when it is seen sweeping the surface of the ocean in pursuit of flying-fish. It seems rather to float and glide in the air than to fly like other birds, as, except when it is rising from the water, the motion of its long wings is scarcely to be perceived. The plumage is soft and abundant, mostly white, dusky on the upper parts, some of the feathers of the back and wings black. The bill is of a delicate pinky-white, inclining to yellow at the tip. The A. is extremely voracious; it feeds chiefly on fish and mollusca, but has no objection to the flesh of a dead whale, or to any kind of carrion. It is not a courageous bird, and is often compelled to yield up its prey to sea-eagles, and even to the larger kinds of gulls. When food is abundant, it gorges itself, like the vultures, and then sits motionless upon the water, so that it may sometimes be taken with the hand. Not unfrequently, however, on the approach of a boat, it disgorges the undigested food, and thus lightened, it flies off. Its cry has been compared to that of the pelican; it also sometimes emits a noise which has been likened to the braying of an ass. Its flesh is unpalatable. It heaps up a rude nest of earth not far from the sea, or deposits its solitary egg in a slight hollow which it makes in the dry ground. The egg is about 4 in. long, white, and spotted at the larger end; it is edible. There are seven species of this genus. One of these (*D. fuliginosa*), chiefly found within the antarctic circle, is called by sailors the Quaker bird, on account of the prevailing brown color of its plumage. Albatrosses appear in great numbers towards the end of

June, about the Kurile islands and Kamchatka. The Kamchadales take them by baited hooks, blow up the entrails for floats to their nets, and make tobacco-pipes and various domestic articles of the wing-bones.

**ALBAY**, a t. of the island of Luzon, Philippine islands, the capital of a province of the same name, in the s. end of the island. It is situated about 2 m. from the bay of Albay, which is an excellent harbor, and very near a volcano also called Albay, which is in a state of constant activity. Earthquakes are frequent, but the province is very fertile. The t. is regularly built, contains some good houses, and is a place of considerable trade. Pop., 13,115.

**ALBE**, or **ALB** (Lat. *albus*, white), the long white linen vestment worn in early times by all ecclesiastics at divine service. It differed from the more modern surplice (q.v.), which is only a modification of it, in having narrower sleeves. At the foot and wrists were embroidered ornaments called *apparels*. In the ancient church newly baptized persons were obliged to wear a similar garment for eight days; and hence catechumens were called *albei*; and the Sunday after Easter, on which they usually received baptism, came to be called dominica in albis. See WHITSUNDAY.

**ALBEMARLE**, a co. in Virginia, s.w. of the Blue Ridge and n. of James river, intersected by the Chesapeake and Ohio, and the Virginia and Tennessee railroads; 700 sq. m.; pop., '80, 33,630—4944 colored. It has an undulating surface, and rich bottom lands. Co. seat, Charlottesville.

**ALBEMARLE**, **GEORGE MONK**, Duke of, 1608-70; an English general, chief agent in the restoration of the Stuarts in 1660. In 1625 he was in the expedition against Spain; served ten years in the Netherlands; was lieutenant-col. in the campaign against the Scots; led a regiment against the Irish; and was governor of Dublin until the peace in 1643. Next year in the civil war he was made prisoner by Fairfax, and kept two years in the Tower, but was released on taking the covenant. Cromwell made him lieutenant-gen. and chief of artillery, and for good service at Dunbar raised him to gen.-in-chief in Scotland. He took part in the commission to arrange the union of Scotland and England, and went to the former country as governor in 1654, with much difficulty maintaining his rule against the Presbyterians. Charles tried to secure his support, but Monk sent the letter to Cromwell, after whose death Monk declared in favor of Richard Cromwell, assuming the defence of public order. On the 1st of Jan., 1660, Monk crossed the border with 6000 men, joined Fairfax at York, and entered London Feb. 3 without opposition. His intentions were not known until Feb. 28, when he called together the Presbyterian members expelled from parliament in 1648, and created a majority for the king, and Charles was formally declared on the 8th of May. Charles made Monk duke of Albemarle, privy-councilor, chamberlain, and lord lieutenant of Devon and Middlesex. In 1666 he commanded the naval expedition against Holland and was beaten by De Ruyter at Dunkirk, in his turn defeating the Dutchmen at North Foreland.

**ALBEMARLE SOUND**, an inlet in the coast of North Carolina, 60 m. long and 4 to 15 wide, separated from the ocean by an island, and not appreciably affected by the tides. It receives the Roanoke and Chowan rivers, and is connected with Currituck and Pamlico sounds by natural channels, and with Chesapeake bay by the Dismal Swamp canal. Having only shallow water, the sound is of little value for navigation.

**ALBER**, **MATTHEW**, 1495-1570; one of the promoters of the reformation, preaching at Reutlingen. He was put under ban by the pope and the imperial court, but went on preaching, strongly supported by the people. He rejected Latin, and used the native tongue in church services, put out the images, and took a wife. He was summoned before the imperial chambers and charged with nearly 70 distinct heresies, to all of which, save that of speaking disrespectfully of the mother of Christ, he confessed guilty. He was tried, but set free without punishment. A. was a friend and ally of Luther. Some of his sermons, a catechism, and a work on *Providence* have been published.

**ALBERI**, **EUGENIO**, 1817-78; an Italian historian. He was several years in the army, but left it in 1830 for literary pursuits. In 1848 he was in the war against Austria as lieutenant-colonel, and was for a time secretary-general in the ministry of war at Rome. He was the author of the *Military History of Prince Eugene of Savoy*, an *Apology for Catharine de Medicis*, and made a collection of important diplomatic reports of Venetian ambassadors of the 16th c.; he also edited the first complete edition of the works of Galileo. His last work was a eulogy of the Roman Catholic religion from a philosophical and political view.

**ALBERIC I.**, a Roman ruler in the beginning of the 10th c.; son of a Lombard nobleman. He married Merozia, daughter of the notorious Theodora, who held the temporal authority, and by union with her he came to be ruler. He joined pope John X. in expelling the Saracens, and ruled the duchy of Spoleto; but the pope banished him from Rome, and he was murdered in 925. His widow married Guido of Tuscany, and, after his death, Hugo, king of Italy, whom her son Alberic II. expelled.

**ALBERIC II.**, son of Alberic I., a wise Roman ruler, who died in 954, after a reign of 23 years. He was succeeded by his son Ottaviano, afterwards pope John XII., in 956.

**ALBERONI, GIULIO, CARDINAL**, the son of a poor vine-dresser, was born on the 31st of May, 1664, at Firenzuola in Parma. From being merely a chorister in a church at Piacenza, he quickly rose, through his abilities, to the dignity of chaplain and favorite of count Roncovieri, bishop of St. Donino. He was afterwards sent to Madrid as *chargé d'affaires*, by the duke of Parma, where he gained the favor of Philip V. of Spain, and had the honors successively conferred on him of grandee, cardinal, and prime-minister. In this last capacity he was of singularly great service to Spain, overthrowing the intriguing family of Ursini, bringing about the second marriage of Philip V. with Elizabeth Farnese, and stimulating the expiring energies of Spain. A new life dawned upon the nation, which learned to forget the hardships it had suffered in the Spanish wars of succession; although, on the other hand, it must be admitted that it was principally through his instrumentality that the last liberties and rights of the people were sacrificed in favor of absolutism. He was ambitious, and ambition is always despotic and unscrupulous; hence, to gratify the covetous desires of his new mistress, he suddenly invaded Sardinia, in violation of the peace of Utrecht, cherishing the hope of re-establishing the monarchy of Charles V. and Philip II., and startling Europe by his insolent audacity. The regent of France broke off his alliance with Spain, and united himself with England and the emperor; but A. was not dismayed. Even when the Spanish fleet in the Mediterranean was destroyed by an English one, he contemplated an extensive war by land, in which all the European powers would have been entangled. He patronized the pretender, to annoy England, and the French Protestants, to annoy Louis. He sought to unite Peter of Russia and Charles XII. with him, to plunge Austria into a war with the Turks, to stir up an insurrection in Hungary, and, through his influence with one of the parties at the French court, he actually accomplished the arrest of the regent himself (the duke of Orleans). But so universal became the complaints against A., that Philip lost courage, and concluded a treaty of peace, the condition of which was that the cardinal should be dismissed, which was effected through the influence of Elizabeth herself, now weary of the arrogance of her late favorite. On the 20th of Dec., 1730, A. received a command to quit Madrid within 24 hours, and the kingdom within 5 days. Exposed to the vengeance of every power whose hatred he had drawn upon himself, he knew no land where he could remain. Not even to Rome could he venture, for Clement was more bitterly inimical to him than any secular potentate. He wandered about in disguise, and under fictitious names. At length he was imprisoned in the Genoese territory, through the solicitation of the pope and the Spanish monarch; but he speedily recovered his liberty, and two years after the death of Clement, was reinstated by Innocent XIII. in all the rights and dignities of a cardinal. In 1740 he retired to Piacenza, where he died twelve years after (June 26, 1752) at the age of 88. He bequeathed his possessions in Lombardy to Philip V., while his cousin and heir, Cæsar A., became possessor of 1,000,000 ducats.

**ALBERS, JOHANN FRIEDRICH HERMANN**, 1805-67; a German physician, professor of pathology at Bonn. He established there an asylum for the treatment of insanity and nervous diseases; and was director of the pharmacological cabinet. His anatomical atlas, and works on various branches of medical science, are regarded as authority.

**ALBERT**, a co. in s.e. New Brunswick, on the bay of Fundy; 677 sq.m.; pop. '71, 10,672. The land is good, with bituminous and cannel coal, oil-bearing shales, plaster, and freestone. Coal and plaster are sent to the United States. Chief t., Hopewell.

**ALBERT**, archbishop of Magdeburg, and elector of Mentz, generally called A. of Brandenburg, younger son of the elector, John Cicero of Brandenburg, was b. in 1489. In 1513 he became archbishop of Magdeburg; in the same year, also, administrator of the bishopric of Halberstadt, and in the following year, archbishop and elector of Mentz. Leo X. having granted him permission to sell indulgences, on condition that he should deliver up half the booty to the papal exchequer, A. appointed the Dominican Tetzels 'indulgence-preacher,' who, by the shameless manner in which he went about his work, first stirred Luther to post up his well-known ninety-five theses. Even in the archbishop's own diocese, the reformer's doctrines found not a few adherents, so that A. was compelled, at the imperial diet at Augsburg, to act the part of peacemaker. When he joined the holy alliance against the treaty of Schmalkald, Luther made a fierce attack on him in writing. He was the first of all the German princes who received the Jesuits into his dominions. In 1541, he granted religious liberty to his subjects, under the condition that they should pay his debts, amounting to 500,000 florins. He did this, not from any love of religious liberty, but either because of the consideration referred to, or from a dread of popular compulsion. The last days of his life were spent in Aschaffenburg, where he d. in 1545.

**ALBERT**, count of Bollstädt, usually called Albertus Magnus, also Albertus Teutonicus, a man less distinguished for originality than for the extent of his acquirements and his efforts for the spread of knowledge, especially of the works and doctrines of Aristotle, was b. at Lauingen, in Swabia, in 1205, or, as some say, in 1193. After finishing his studies at Padua, he entered the order of the Dominican friars, and taught in the schools of Hildesheim, Ratisbon, and Cologne, where Thomas Aquinas became his pupil. In 1230 he repaired to Paris, where he publicly expounded the doctrines of Aristotle, in spite of the prohibition of the church. In 1249, he became rector of the school at

Cologne; and in 1254, provincial of the Dominican order in Germany. In 1260, he received from pope Alexander IV. the bishopric of Ratisbon. But in 1262, he retired to his convent at Cologne, to devote himself to literary pursuits; and here he composed a great number of works, especially commentaries on Aristotle. He had fallen into dotage some years before his death, which occurred in 1280. The fullest edition of his works was prepared by Pierre Jammy, the Dominican (21 vols., Lyon and Leyden, 1651); but it is far from being complete. Many of the writings attributed to A. seem to be spurious; among others, that entitled *De Secretis Mulierum*, which was widely circulated during the middle ages. The extensive chemical and mechanical knowledge which A. possessed, considering the age in which he lived, brought upon him the imputation of sorcery; and in German tradition he has a very ambiguous reputation. It is recorded, for instance, that in the winter of 1240, he gave a banquet in the garden of his convent, at Cologne, to William of Holland, king of the Romans; and that during the entertainment the wintry scene was suddenly transformed into one of summer bloom and beauty. This myth rests most likely on the fact of A. having had a green-house.—The scholastics who followed A.'s opinions took the name of *Albertists*.

**ALBERT**, last grand-master of the Teutonic order, and first duke of Prussia, was b. in 1490. He was the son of the margrave Frederic of Anspach and Baireuth, who, having several children, wished to make him enter the church. He was educated under the care of archbishop Hermann, of Cologne, where he became canon. He did not, however, neglect knightly exercises. He accompanied the emperor Maximilian I. in his expedition against Venice, and was present at the siege of Pavia. In 1511, when scarcely 21 years old, he was chosen grand-master of the Teutonic order, the knights expecting their feudal allegiance to Poland to be abolished, on account of his near relationship to Sigismund, the monarch of that country, while they also hoped for protection against the latter from his friends in Germany. He was consecrated at Mergentheim with his father's consent. In 1512 he removed to Königsberg, having been acknowledged by Poland likewise; but refusing to take the oath of allegiance, he was plunged into a war with Sigismund in 1520. The year after, a four years' truce was agreed to at Thorn. A. next made his appearance at the imperial diet at Nürnberg, as a German prince of the empire, to induce the other princes to assist him against the Poles. But Germany could at that time grant no assistance to any one. Disappointed in his hopes, A. threw himself into the cause of the reformation, which had rapidly spread into Prussia, and broken the last strength of the declining order, whose possessions now appeared a certain prey to Poland. A. still hoped to preserve these, by acting upon Luther's advice, which was, to declare himself secular to the duke of Prussia, and place his land under the sovereignty of Sigismund. This was done with great pomp at Cracow, on the 8th April 1525, the duchy being secured to him and his descendants. During the remainder of his life, A. zealously sought to further the welfare of his duchy. He regulated the administration of all affairs, both secular and ecclesiastical, established the ducal library, founded in 1543 the university of Königsberg, gathered many literary men around him, and caused their works to be printed. In 1527, he married Dorothea, daughter of Frederick, king of Denmark. A. earnestly desired peace, but his was not an age in which peace could be purchased. The transition period from the old to the new is always violent, and the duke found himself entangled in conflicts with the nobles, and in theological disputes, which, along with other crosses of a more personal character, saddened the close of his life. He d. in 1568. See PRUSSIA.

**ALBERT**, or **ALBRECHT**. Five sovereign dukes of Austria (q. v.) bore this name, of whom two (I. and V.) were also emperors of Germany. A. I., duke of Austria and emperor of Germany, was the eldest son of Rudolph I., and born in the year 1248. Rudolph, about the close of his career, made an effort to have A. appointed his successor; but the electors, tired of his authority, and emboldened by his age and infirmities, refused to comply with his request. After Rudolph's death, Austria and Styria revolted; but A., having vigorously crushed the insurrection, had the audacity to assume the insignia of the empire without waiting for the decision of the diet. This violent measure induced the electors to choose, in preference to him, Adolphus of Nassau. Disturbances in Switzerland, and a disease which cost him an eye, now rendered him more humble; he delivered up the insignia which he had so rashly assumed, and took the oath of allegiance to the new emperor, who, however, after some years, so completely disgusted his subjects, that A. began to entertain hopes of recovering his imperial dignity. In 1298, Adolphus was deposed, and A. elected; but the former having resolved to maintain his title, A. was obliged to fight for the crown. The rivals drew up their forces near Worms, where a battle ensued, in which Adolphus was defeated and slain. A., feeling that he might now safely display magnanimity, voluntarily resigned the crown which had been recently conferred upon him; and, as he had anticipated, was unanimously re-elected. His coronation took place at Aix-la-Chapelle, in August, 1298. But the pope, Boniface VIII., denied the right of the princes to elect A., declared himself the only true emperor and legitimate king of the Romans, summoned the former before him, required him to ask pardon and do penance, forbade the princes to acknowledge him, and released them from their oath of allegiance. A., on the other hand, with his usual intrepidity, defied his holiness, formed an alliance with Philip the fair of France, secured the neutrality

of Saxony and Brandenburg, invaded the electorate of Metz, and forced the archbishop to break off his alliance with Boniface and to form one with himself for the next five years. The pope was alarmed by his success, and entered into negotiations with him. A., whose duplicity and unscrupulousness equaled his courage, suddenly broke off his alliance with Philip, admitted the western empire to be a papal grant, and declared that the electors derived their right of choosing from the holy see. Moreover he promised upon oath to defend the rights of the Romish court whenever he was called upon. As a reward, Boniface gave him the kingdom of France, excommunicating Philip, and declaring him to have forfeited the crown; but the latter severely chastised the pope for his insolence in daring to give away what was not his own. In the following year, A. made war unsuccessfully against Holland, Zealand, Friesland, Hungary, Bohemia, and Thuringia. Shortly afterwards, news reached him that a rebellion had broken out amongst the Swiss in Unterwalden, Schweitz, and Uri, in Jan., 1308. A. had not only foreseen, but desired this, in order that he might find a pretext for completely subjugating the country. A new act of injustice, however, occasioned a crime which put an end to his ambition and life. His nephew, duke John, claimed Swabia as his rightful inheritance, and had set his claims before A., but in vain. When the latter was departing for Switzerland, the former renewed his demand. A. scoffingly refused; and duke John resolved to be revenged. Along with four others, he conspired against his uncle's life, and assassinated him on the way to Rheinfelden, while separated from his followers by the river Reuss. The emperor expired May 1, 1308, in the arms of a beggar-woman sitting by the wayside—a spectacle calculated to excite stern reflection on the vanity of human ambition. His daughter Agnes, queen of Hungary, frightfully revenged her father's death. See JOHN, THE PARRICIDE. A. left five sons and five daughters, the children of his marriage with Elizabeth, daughter of the count of Tyrol.

**ALBERT**, or **ALBRECHT**, Archduke of Austria, b. in 1559, was the third son of the emperor Maximilian II. He was brought up at the Spanish court, and dedicated himself to the church. In 1577 he was made cardinal, in 1584, archbishop of Toledo, and during the years 1594-96, held the office of viceroy of Portugal. He was next appointed stadtholder of the Netherlands, where he continued, until his death, the representative of the Spanish monarch, discharging the duties of his function with prudence and dignity. Cardinal Bentivoglio, who resided a considerable time at his court, praises his uprightness, his moderation, his love of serious study, his industry, his perseverance, and his discretion, though he does not conceal the fact that he was a prince better fitted for peace than for war. He displayed at first both courage and enthusiasm, but afterwards he was accused of dilatoriness and timidity. Meanwhile, he did not receive from Spain the promised help; and, moreover, affairs had reached such a pitch, that they could hardly become worse. A., however, did the best that could be done. His mild, moderate, and unpersecuting character, essentially contributed to the re-establishment of the Spanish authority in the Netherlands. Philip employed him to mediate amid the disturbed provinces. A. now abandoned his ecclesiastical profession, and married (1598) the infanta, Isabella, who received the Netherlands for her dowry. He d. in 1621.

**ALBERT**, **ALEXANDER MARTIN**, a member of the provisional government of France after the revolution of Feb., 1848, was b. at Bury (Oise) in 1815. His father was a peasant, and he himself learned a mechanical trade at Paris. He took part in the revolution of July 1830, and was implicated in the celebrated trial of 1834; after which he devoted himself to the study and discussion of political questions, yet not abandoning his workshop. He commenced at Lyon the republican journal called *La Glaneuse*, on account of which he was condemned to a fine of 5000 francs when the insurrection broke out at Lyon. In 1840 he began *L'Atelier*, a paper conducted exclusively by operatives, and devoted to their interests. On the evening before the proclamation of the republic in Feb., 1848, he was making buttons in his workshop; and on the nomination of Louis Blanc, he was called to take part in the provisional government. He was afterwards chosen president of the commission for national rewards; but he soon resigned this post. He was elected by a large majority of voices as the representative of the department of the Seine in the national assembly; but involving himself in the attempt of May 15, 1848, against the government as it then existed, he was arrested, and sentenced to transportation. He was, however, soon liberated.

**ALBERT**, **FRANCIS (ALBERT) AUGUSTUS-CHARLES-EMMANUEL**, Prince of Saxe-Coburg-Gotha, consort of Victoria, queen of Great Britain, b. Aug. 26, 1819, was the second son of the late duke of Saxe-Coburg-Gotha, by his first marriage with Louisa, daughter of the duke of Saxe-Gotha-Altenburg. The prince, after a careful domestic education, along with his elder brother, the reigning duke, attended the university of Bonn, where, in addition to the sciences connected with state-craft, he devoted himself with ardor to the study of natural history and chemistry, and displayed great taste for the fine arts, especially painting and music. Several compositions of his obtained publicity, and an opera was afterwards performed in London, said to have been composed by him. Gifted with a handsome figure, he attained expertness in all knightly exercises. It was this accomplished prince that the young queen of Great Britain selected as her partner for life. The marriage was celebrated in London on the 10th of Feb. 1840. On his marriage, prince Albert received the title of royal highness, was naturalized as a subject of Great

Britain, and obtained the rank of field-marshal, the knighthood of the order of the bath, and the command of a regiment of hussars. As the union proved, in the highest degree, a happy one, the prince was loaded with honors and distinctions both by the queen and the nation. The title of consort of her most gracious majesty was formally conferred in 1842, and that of prince consort, in 1857, made him a prince of the united kingdom. He was also made a member of the privy council, governor and constable of Windsor Castle, colonel of the grenadier guards, acting grand master of the order of the bath, chancellor of the university of Cambridge, master of the Trinity house, etc. Notwithstanding his high and favored position, the prince, with rare prudence and tact, abstained from meddling with state affairs, and thus escaped the jealousy and detraction of parties. When the whig ministry of 1840 proposed for him the income of £50,000, as consort of queen Victoria, the Tories, in conjunction with the radicals, succeeded in limiting the sum to £30,000. This appears to have been the only instance of any manifestation of party feeling with reference to the prince. On the other hand, he opened for himself an influential sphere of action, in the encouragement and promotion of science and art, appearing as the patron of many useful associations and public undertakings. The exhibition of 1851 owed much to the prince. He d. 14th Dec., 1861. Vols. i. to iv. of his *Life* by Theodore Martin appeared between '74 and '79.

ALBERT, FREDERICK RUDOLPH, b. 1817; Archduke of Austria, son of archduke Charles, and grandson of Leopold II., first cousin of the father of the reigning emperor. He was distinguished in youth as a cavalry commander, doing good service in the battle of Novara, in 1849. He was governor of Hungary 1851-60; in 1866 he commanded the Austrians in Venetia, and won the victory of Custoza, June 24; but Benedek's defeat at Sadova, July 3, made his success of no account. He is still field-marshal and inspector general of the Austrian army. A. married, May 1, 1844, archduchess Hildegarde, daughter of Louis I. of Bavaria. She d. April 2, 1864.

ALBERT, FRIEDRICH AUGUST; b. April 23, 1828, Crown Prince of Saxony, son of king John and queen Amelie. He was a general in the Schleswig-Holstein war, and after his father's accession in 1854 presided over the council of state. In 1866 he commanded the Saxon army coöperating with the Austrians against Prussia, and received a decoration for the behavior of his troops. On the union of Saxony with the n. German confederation, this force became the 12th corps of the n. German army, and with them the prince won high honors at Gravelotte and Sedan, receiving the Prussian iron cross and the command-in-chief of the newly-formed 4th army, at the head of which he entered Paris with the emperor and the German princes. He married, June 18, 1853, Caroline Frédérique Françoise Stéphanie Amélie Cécile, daughter of Gustavus, prince of Vasa, and their children are 2 daughters and 4 sons, the last b. Feb. 25, 1875.

ALBERT EDWARD, PRINCE OF WALES, b. Nov. 9, 1841; heir-apparent of the British throne, eldest son and second child of Victoria and Albert. He is duke of Cornwall, according to the statute of 1337, with annual revenue of about \$250,000. He was created prince of Wales in 1841, and earl of Dublin in 1850; is high steward of Scotland, duke of Rothesay, earl of Carrick, baron of Renfrew, and lord of the isles. He is also a knight of the garter, general in the army, and colonel of the 10th hussars. His early education was under Rev. Henry Birch, rector of Prestwich; Mr. Gibbs, barrister; Rev. C. F. Tarver, and H. W. Fisher. He visited Canada and the United States in 1860; joined the camp at Curragh in June, 1861; travelled in 1862 in the east with Dean Stanley, visiting Jerusalem; and in 1875-76 made a tour of India. He married March 10, 1863, princess Alexandra, daughter of Christian IX., king of Denmark. Their children are: 1, prince Albert Victor Christian, duke of Cornwall, b. Jan. 8, 1864; 2, prince George Frederick Ernest Albert, b. June 3, 1865; 3, princess Louise Victoria Alexandra Dagmar, b. Feb. 20, 1867; 4, princess Alexandra Olga Mary, b. July 6, 1868; 5, princess Maud Charlotte Mary Victoria, b. Nov. 26, 1869. Prince A. was chosen grand master of free-masons in 1867, succeeding the marquis of Ripon.

ALBERTI, LEON BATTISTA, 1404-72; an Italian architect, and writer on art and poetry, employed by pope Nicholas V. He completed the Pitti palace at Florence, and designed the church of St. Frances at Rimini. His chief book, *De Re Edificatoria*, is highly valued.

ALBERTINELLI, MARIOTTO, 1475-1520; a Florentine painter, the friend, pupil, and imitator of Fra Bartolommeo. His work *The Visitation of Mary and Elizabeth* is in the Uffizi gallery at Florence. Other works are in Munich, and in the Louvre.

ALBERT NYANZA (the Little Luta Nzige of Speke), a large lake of e. central Africa, one of the reservoirs of the Nile, situated in a deep rock-basin, 80 m. w. of the Victoria Nyanza. The A. N. is of an oblong shape, and, as proved by M. Gessi, one of colonel Gordon's party in 1876, is 140 m. long from n. to s., and 40 m. broad. It is crossed by the equator near its center. On the e., it is fringed by precipitous cliffs, having a mean alt. of 1500 ft., with isolated peaks, rising from 5000 to 10,000 ft. The surface of the lake is 2720 ft. above the sea, and 1470 ft. below the general level of the country; its water is fresh and sweet, and it is of great depth towards the center. The n. and w. shores of the lake are bordered by a massive range of hills, called the Blue mountains, which have an elevation of about 7000 ft. The existence of this vast lake first became

known to Europeans through Speke and Grant, who, in 1862, heard of the Luta Nzige as a narrow reservoir forming a shallow back-water of the Nile. See map to article NILE. When Speke and Grant, after the discovery of the Victoria Nyanza, were, in 1863, descending the Nile on their return to Europe, they met, at Gondokoro, Mr. (now Sir) Samuel White Baker (q.v.), who was ascending the river in the hope of meeting with and aiding these travelers. As soon as they informed him of the reputed great lake, Baker agreed to undertake its exploration. Joining a trading party, he traveled south-eastwards to Latooka, which he describes as the finest country he had seen in Africa. His course was now s. and s.w., through the countries of Obbo and Madi, crossing the Asua, a tributary of the Nile, on 9th Jan. 1864. Journeying next in a s. and south-eastward direction over uninhabited prairies and swampy hollows, he came upon the Nile at the Karuma falls, lat.  $2^{\circ} 17' N.$ , at the identical spot where it had been crossed by Speke and Grant. Being prevented, by the jealousy of king Kamrasi, from following the course of the stream to the westward, he was forced to proceed, by slow marches southward on the w. side of the Somerset or Nile, to M'rooli, leaving which, his course lay s.w. on the s. side of the Kafoor river. After a toilsome march of 18 days from M'rooli, the party came in sight of the glorious expanse of water. Baker says: "Weak and exhausted with more than 12 months' anxiety, toil, and sickness, I tottered down the steep and zigzag path, and in about 2 hours reached the shore. The waves were rolling upon a bank of sand; and as I drank the water, and bathed my face in the welcome flood with a feeling of true gratitude for success, I named this great basin the Albert Nyanza, in memory of a great man who had passed away."

The spot where the party first reached the lake, Vacovia, is in lat.  $1^{\circ} 14' N.$ ,  $30^{\circ} 40' E.$  Embarking thence in canoes, the party coasted north-eastward, and in 13 days arrived at Magungo, lat.  $2^{\circ} 16' N.$ , near the mouth of the Somerset river. At this part, the lake was under 20 m. in width, and appeared to stretch away in a n.w. direction. From Magungo, 250 ft. above the lake, the travelers had a view of the Nile valley for 15 or 20 m. northwards. Ascending the Somerset, at a distance of 25 m. from its mouth, the canoe-voyage was interrupted by a grand cataract 120 ft. high, which was named the Murchison falls. The explorers proceeded south-eastwards for about 30 m. to Kisoona, and then a march n.e. for about the same distance brought them to the Karuma falls, where they first entered the lake-region. The name Somerset is adopted from Speke's first map, in order to distinguish that river from the Nile proper. It issues from the Victoria Nyanza at the Ripon falls, and flowing n.w. and w. for about 230 m., it enters the A. N. within 30 m. of its northern extremity, and soon quits it to form the true Nile. From the Ripon falls for 30 m. n., and from the Karuma to the Murchison falls, 45 m., the Somerset forms a series of rapids. The A. N. receives the drainage of a great equatorial mountain range, where rain falls during 10 months of the year. The scenery of the lake is described as extremely beautiful. Salt, which is very abundant in the soil on the eastern shores of the lake, is now the only article of trade to the inhabitants. Formerly, Magungo was a large t., when the trade from Karague, in lat.  $2^{\circ} S.$ , was conducted in large boats sent by Rumanika, the king of the country, with cowrie shells and brass bracelets from Zanguebar to be exchanged for ivory.

**ALBERT THE BEAR** (so called, not from any peculiarity of character or appearance, but from the heraldic cognizance that he assumed), margrave of Brandenburg, one of the most remarkable princes of his age, was b. 1106. He was the son and successor of Otho, the rich count of Ballenstädt, and of Elica, eldest daughter of Magnus, duke of Saxony. Having proved faithful to the emperor Lothario, he received from the latter Lusace, to be held as a fief of the empire; but the duchy of Saxony, to which he had the best claim, was given to Henry of Bavaria (1127), the son of the youngest daughter of the duke. As a compensation, A. was made margrave (markgraf) of the northern march or marek (Salzwedel); but in the year 1128, Henry having been put under the imperial ban, the duchy reverted to the former, when he took the title of duke of Saxony. Henry, however, again got the upper hand, and A. was compelled to fly, and to content himself with the margraviate of northern Saxony, and the government of Swabia, which was given him as an indemnity. Returning to his own country, he got himself invested with the lands which he had conquered from the Wends as a hereditary fief of the empire, and thus became the founder and first margrave of the new state of Brandenburg. Under A. the margravedom was afterwards raised to be an electorate, and he himself became elector of Brandenburg. After he had quelled a revolt of the Wends in 1157, he determined to take extreme measures against the vanquished. He almost depopulated their country, and then colonized it with Flemings. On his return from a pilgrimage to Palestine in company with his wife in 1159, he exerted himself to suppress the language and paganism of the Wends, and to introduce Christianity amongst them. He died in 1176, at Ballenstädt, where he was buried. Brandenburg continued in the possession of his descendants for two centuries, and finally (1415) fell to the house of Hohenzollern (q.v.).

**ALBERTUS MAGNUS.** See **ALBERT OF BOLLSTÄDT.**

**ALBI**, capital of the department of Tarn in France, is built on a height. It is very old, and suffered greatly during the religious wars which devastated the land in the time of the Albigenses. Besides the usual government offices, it possesses a public library of 12,000 volumes, and a museum. The chief buildings are the cathedral, built in the style

of the 12th c., the old palace of the count of Albigeois, and the theater. There is considerable trade in corn, wine, fruit, etc., and linen, cotton, woollen, and leather manufactures. Pop. 72, 13,698.

**ALBIGENSES** is a name applied loosely to the "heretics," belonging to various sects, that abounded in the s. of France about the beginning of the 13th c. The chief sect was the Cathari (q. v.); but they all agreed in renouncing the authority of the popes and the discipline of the Romish church. The name arose from the circumstance that the district of Albigeois in Languedoc—now in the department of Tarn, of which Albi is the capital—was the first point against which the crusade of pope Innocent III., 1209, was directed. The immediate pretense of the crusade was the murder of the papal legate and inquisitor, Peter of Castelnau, who had been commissioned to extirpate heresy in the dominions of count Raymond VI. of Toulouse; but its real object was to deprive the count of his lands, as he had become an object of hatred from his toleration of the heretics. It was in vain that he had submitted to the most humiliating penance and flagellation from the hands of the legate Milo, and had purchased the papal absolution by great sacrifices. The legates, Arnold, abbot of Cîteaux and Milo, who directed the expedition, took by storm Beziers, the capital of Raymond's nephew, Roger, and massacred 20,000—some say 40,000—of the inhabitants, Catholics as well as heretics. "Kill them all," said Arnold; "God will know his own!" Simon, count of Montfort, who conducted the war under the legates, proceeded in the same relentless way with other places in the territories of Raymond and his allies. Of these, Roger of Beziers died in prison, and Peter I. of Aragon fell in battle. The conquered lands were given as a reward to Simon of Montfort, who never came into quiet possession of the gift. At the siege of Toulouse, 1218, he was killed by a stone, and counts Raymond VI. and VII. disputed the possession of their territories with his son. But the papal indulgences drew fresh crusaders from every province of France, to continue the war. Raymond VII. continued to struggle bravely against the legates and Louis VIII. of France, to whom Montfort had ceded his pretensions, and who fell in the war in 1226. After hundreds of thousands had perished on both sides, a peace was concluded, in 1229, at which Raymond purchased relief from the ban of the church by immense sums of money, gave up Narbonne and several lordships to Louis IX., and had to make his son-in-law, the brother of Louis, heir of his other possessions. These provinces, hitherto independent, were thus, for the first time, joined to the kingdom of France; and the pope sanctioned the acquisition, in order to bind Louis more firmly to the papal chair, and induce him more readily to admit the inquisition. The heretics were handed over to the proselytizing zeal of the order of Dominicans, and the bloody tribunals of the inquisition; and both used their utmost power to bring the recusant A. to the stake, and also, by inflicting severe punishment on the penitent converts, to inspire dread of incurring the church's displeasure. From the middle of the 13th c., the name of the A. gradually disappears. The remnants of them took refuge in the east, and settled in Bosnia. Compare Fauriel, *Croisade contre les Albigeois* (Par. 1838); Faber, *Inquiry into the History and Theology of the Vallenses and Albigenes* (Lond. 1833); Peyrat, *Hist. des Albigeois* (Par. 1870).

**ALBINOS**—called also Leucothiopes, or white negroes, and by the Dutch and Germans kakerlaken—were at one time considered a distinct race; but closer observation has shown that the same phenomenon occurs in individuals of all races, and that the peculiar appearance arises from an irregularity in the skin, which has got the name of *leucopathy* or *leucosis*. It consists in the absence of the coloring matter which, in the normal state, is secreted between the cuticle and the true skin, and also of the dark pigment of the eye; so that the skin has a pale, sickly white color, while the iris of the eye appears red, from its great vascularity. As the pigment in the coats of the eye serves to diminish the stimulus of the light upon the retina, A. generally cannot bear a strong light; on the other hand, they see better in the dark than others. The coloring matter of the hair is also wanting in A., so that their hair is white. All these differences are of course more striking in the darker varieties of the species, and most of all in the negro albinos.

Albinism is always born with the individual, and occurs not only in men, but also in other mammalia, in birds, and probably in insects. It is not improbable that the peculiarity may, to some extent, be hereditary. The opinion that A. are distinguished from other men by weakness of body and mind, is completely refuted by facts.

**ALBINUS** or **WEISS**, **BERNHARD SIEGFRIED**, 1697–1770; a German anatomist. He studied at Leyden under Boërhaave and Rau, and also in Paris under Valliant and Winslow. In 1719, he lectured on anatomy and surgery in Leyden; two years later he succeeded his father in the professorship of the same branches. He speedily became one of the most famous teachers of anatomy in Europe, and not only students but practising physicians resorted to his rooms. In 1745, he was appointed professor of the practice of medicine, his brother, Frederick Bernard, taking the chair of anatomy. He was twice rector of his university, and was an associate of the learned societies of London and other capitals.

**AL'BION** is the most ancient name on record of the island of Great Britain. See **AL'BANY** or **AL'BAINN**.

**ALBION**, the seat of justice of Orleans co., N. Y., 40 m. n. e. of Buffalo: pop. 75, 54-7. The Erie canal and Niagara branch of N. Y. Central railroad pass through it. There are several churches, an academy, a female seminary, banks, and newspapers.

**ALBIR'CO**, a double star in the head of the swan; interesting to spectroscopists for the different color lines of its components; the larger star is orange, and the smaller one blue.

**ALBOIN**, the founder of the Lombard dominion in Italy, succeeded his father in 561 A.D., as king of the Lombards, who were at that time settled in Pannonia. His thirst for action first vented itself in aiding Narses against the Ostrogoths; and afterwards, in a war with the Gepidae, whom he, in conjunction with the Avari, defeated in a great battle (566), slaying their king Cunimond with his own hand. On the death of his first wife, Kledoswinda, he married Rosamond, daughter of Cunimond, who was his prisoner. Some of his warriors, who had accompanied Narses into Italy, brought back reports of the beauties and riches of the country. This determined A., in 568, to enter Italy with his own nation of Lombards, the remains of the Gepidae, and 20,000 Saxons. He soon overran and subdued the n. of the country as far as the Tiber, fixing his principal residence at Pavia—which long continued to be the capital of the Lombards; when his barbarity cost him his life. During a feast at Verona, he made his queen drink out of the skull of her father, which he had converted into a wine-cup. In revenge, she incited her paramour to murder her husband, who fell 574. Strangely enough, A. was a just and beneficial ruler. He was beloved by his subjects, whom he stimulated into that vital activity that characterized their descendants for ages. For several centuries, his name continued to be illustrious among the German nations, who celebrated his praises in martial songs. To escape the fury of the Lombards, Rosamond fled with her associate and the treasure to Longinus, the exarch, at Ravenna. Longinus becoming a suitor for her hand, she administered poison to Helmichis, her paramour, who, discovering the treachery, caused her to swallow the remainder of the cup, and die with him.

**ALBONI, MARIETTA**, b. 1824, or 1826; an Italian contralto, pupil of Rossini. She made her debut at the age of 15 at the Communal theater of Bologna, where her success led to an engagement at La Scala, Milan. She made rapid progress, and in 1846-47 sang in all the principal cities of Europe, in London at Covent garden in rivalry with Jenny Lind, who was at Her Majesty's theater. In 1852 she visited the United States, remaining over a year, and singing in the chief towns in opera and concert. Her celebrity was owing to the power, fine quality, flexibility, and compass of her voice, a true contralto compassing 2½ octaves, and ranging as high as a mezzo-soprano; her florid style gaining great effect from her vivacity and grace of action. She married count Pepulo, of the Roman states, but kept her maiden name on the stage, appearing in opera at Munich as late as 1872.

**AL BORÂK** (the lightning), the name of the creature—some say camel—on which Mohammed was believed to make journeys between earth and heaven.

**ALBORNOZ**, **ÆGIDIUS ALVAREZ CARILLO**, a warlike prelate of the middle ages, was b. at Cuenca. He studied at Toulouse, and subsequently became almoner to Alfonso XI., king of Castile, who appointed him archdeacon of Calatrava, and finally archbishop of Toledo. He took part in the wars against the Moors, saved the life of the king in the battle at Tarifa, and was present at the siege of Algeciras, where the king dubbed him knight. On account of the Christian boldness with which he denounced the criminal excesses of Peter the cruel, he fell into disgrace, and had to flee to pope Clement VI., at Avignon, who made him a cardinal. Innocent VII. also recognized his political talents and sent him as cardinal-legate to Rome, where, by his tact and vigor, he secured, in spite of the intricate complication of affairs, the restoration of the papal authority in the states of the church (1353-62). Pope Urban V. owed the recovery of his dominions to him, and out of gratitude appointed him legate at Bologna in 1367. In the same year he died at Viterbo, but, expressing a wish to be buried at Toledo, almost royal honors were rendered to his dead body by the Spanish monarch, Henry of Castile; and Urban even granted an indulgence to all who had assisted in the transference of his remains from Viterbo to Toledo. He left a valuable work upon the constitution of the Romish church, printed for the first time at Jesi in 1473, and now very rare.

**ALBOSTAN**, a t. of Asiatic Turkey, in the pashalic of Marash, and 39 m. n. e. by n. from Marash. Pop. estimated at 9000.

**ALBOX**, a t. of Andalusia, Spain, in the province of Almeria, 42 m. n. e. from Almeria, on a small affluent of the Almazora, which divides the t. into two parts. It has some good streets and buildings, and a fine square. Blankets, coarse linen and hempen fabrics, and earthenware are manufactured. There are also corn and oil mills. There is a great annual fair in Nov., lasting for a fortnight. Pop. 7430.

**ALBRECHTSBERGER, JOHANN GEORG**, 1736-1809; an Austrian musician. He studied under Mann, the Vienna court organist, and became one of the most learned and skillful contrapuntists of his age. In 1772 he was appointed court organist, and in 1792 kapellmeister of St. Stephen's cathedral. Among his pupils were Beethoven, Hummel, Moscheles, Seyfried, and Weigl. His published works consist of preludes, fugues, and sonatas for the piano and organ, and string quartettes; but the greater portion

of his labors are in manuscript, in possession of prince Esterhazy. His most valuable service to music was in his theoretical works, which substantially superseded earlier treatises.

**ALBRET, JEANNE D'**, 1528-72, queen of Navarre, only daughter of Henry II. and Margaret, sister of Francis I. Jeanne married Antoine de Bourbon. She was celebrated for her intellectual strength and personal beauty. She embraced Calvinism, while her husband adhered to the Roman church, and asked the pope to annul his marriage; but Antoine died soon afterwards; and, in spite of Spanish menaces and Roman intrigue, Jeanne kept her possessions. In 1567 she declared the reformed religion established in the kingdom; and in 1569, with her children Henry and Catherine, she brought a small band of Huguenots to Coligny at La Rochelle, where, after the murder of the prince of Condé, she was looked upon as the only support of the Protestants. She wrote prose and verse, and some of her sonnets have been published.

**ALBRIGHT, JACOB**, a Lutheran minister, 1759-1800; b. Pennsylvania; founder of the EVANGELICAL ASSOCIATION (q.v.).

**ALBUCA'SIS**, or **ABOO-L-KASIM**, d. 1110; the most celebrated of Arabian writers on surgery; supposed to have practiced in Cordova. His chief work on anatomy, physiology, and the practice of medicine and surgery, is of great value, the treatise on surgery being the best that has come to us from antiquity, and important for tracing the progress of the art.

**ALBUERA**, in the Spanish province of Estremadura, an insignificant hamlet, famous for the battle of May 16, 1811, between the combined English, Spanish, and Portuguese forces under gen. Beresford, and the French under marshal Soult, who were scarcely so numerous, but had abundant artillery. The object of the latter was to compel the English to raise the siege of Badajoz. The result was that Soult was obliged to retreat to Seville with the loss of 9000 men; the loss of the allied forces was about 7000. In proportion to the numbers engaged, the battle was the most sanguinary in the whole contest. The French had at first got possession of a height which commanded the whole position of the allied army, but they were driven from it by 6000 British, only 1500 of whom reached the top unwounded.

**ALBUFERA** (an Arabic word meaning "the lake"), a lake near Valencia, in Spain, about 10 m. in length and the same in breadth, divided from the sea by a narrow tongue of land; a canal connects it with the city of Valencia. It is rich in fish and fowl, and is said to have been excavated by the Moors. From it marshal Suchet (q.v.) took the title of duke.

**ALBUGO** is a term employed in surgery to designate the white opacity that often follows ulceration of the cornea of the eye. In infancy, the comparatively rapid interchange of materials will often diminish to a great extent both the extent and density of these spots, but in after-life they do not undergo similar absorption, nor are they amenable to surgical relief.

**ALBUI**, amongst the Romans, was a white tablet overlaid with gypsum, on which were written the *Annales Maximæ* of the pontifex, edicts of the prætor, and rules relative to civil matters. It was so called, either because it was composed of a white material, or because the letters used were of that color. To tamper with the names written on an A. was regarded by the Romans as a serious offense, and involved a severe penalty. In the middle ages the word was used to denote any list, catalogue, or register, whether of saints, soldiers, or civil functionaries. In the gymnasia and universities on the continent the list of the names of the members is called the A. The name is also applied to the "black board" on which public notifications of lectures, etc., are written up. But its popular signification in modern times is that of a book for containing photographs, or a blank book for a drawing room table, and intended to receive the fugitive pieces of verse, or the signatures of distinguished persons, or sometimes merely drawings, prints, marine plants, etc.

**ALBUMEN** is an organic compound, found both in animal and vegetable substances. It forms the chief ingredient in the white of egg, and abounds in the blood and chyle, and more or less in all the serous fluids of the animal body: it also exists in the sap of vegetables, and in their seeds and other edible parts. A. forms the starting point of animal tissues, for in an egg during incubation all the parts of the chick are formed out of it. The organized substances, fibrine and caseine, have a chemical composition similar to A.; and hence, along with A., they are called albuminous compounds. A. may be considered a raw material of fibrine, and fibrine as animalized A.

The chief component elements of A. are carbon, hydrogen, nitrogen, and oxygen, with small proportions of phosphorus and sulphur. It is believed to be a definite chemical compound, though the exact proportions and the rational formula have not been definitely ascertained. Carbon forms about 54 per cent of it; nitrogen, 16; and sulphur, 2. It is the sulphur of the A. that blackens silver when brought in contact with eggs, and the smell of rotten eggs arises from the formation of sulphureted hydrogen during the decomposition.

A. is soluble in water, and in such a state of solution is found in the egg, the juice of flesh, the serum of blood, and the juice of vegetables; but when heated from 140° to 160°

it coagulates, and is no longer soluble in water. With bichloride of mercury (corrosive sublimate), sulphate of copper (blue vitriol), acetate of lead (sugar of lead), nitrate of silver (lunar caustic), it forms insoluble compounds, and is therefore used as an antidote to these poisons. The property of coagulating with heat adapts A. for the purpose of clarifying in sugar-refining and other processes. The A. is added to the liquid in the cold state, allowed to mix thoroughly therein, and then, when heated, it coagulates, entangling and separating all the impurities suspended in the liquid. A. is likewise coagulated by the majority of the mineral acids, but not by acetic acid. Alcohol, ether, creosote, and tannic acid likewise cause the coagulation of A., and hence the efficacy of these substances, especially the two latter, in coagulating and thereby killing the nerves which cause so much pain in toothache. The importance of A. as an article of diet will be discussed under Food.

**ALBUMEN**, in botany, a store of nutritive matter, distinct from the embryo, but inclosed along with it within the integuments of the seed. It is also known by the names *perisperm* and *endosperm*. When a seed has a store of A. separate from the embryo, it is said to be *albuminous* or *perispermic*. When the nutritive matter is stored up in the cotyledons or lobes of the seed itself, as in the bean, pea, wall-flower, etc., the seed is said to be *exalbuminous* or *aperispermic*. In these the A., as a distinct part of the seed, is wanting, and the entire seed consists of embryo and integument. When the A. is present, it is sometimes very small, as in the nettle; in other instances, on the contrary, it is very much larger than the embryo, as in the cocoa-nut, of which it forms the edible part. It is also the edible or useful part of many other seeds—as in the different kinds of corn—and in coffee, nutmeg, etc. It is sometimes *mealy* or *farinaceous*, as in the cereals; *oily*, as in the poppy; *horny*, as in coffee; *cartilaginous*, as in the cocoa-nut; *mucilaginous*, as in the mallow. Vegetable ivory is the A. of a palm (genus *phytelephas*) which grows on the banks of the Magdalena, and is used in place of ivory. The presence or absence, and various peculiarities of A., afford botanical characters of great value. The A. appears to be a store provided for the nourishment of the embryo, and consists of starchy, oily, and albuminous matter. *Vegetable A.*, in a chemical sense, exists, and often in large quantity, even in seeds, which, according to the language of descriptive botany, are exalbuminous or destitute of A.; and to prevent confusion, *perisperm* has begun to be employed as the botanical term; but it is not yet in general use.

**ALBUMENOIDS**, or **PROTEIDS**, organic bodies in animals or plants; chief constituents of blood, nerve, muscle, glands, and other organs in animals; in smaller proportion but important in vegetable life. They consist of carbon, 52.7 to 54.5; hydrogen, 6.9 to 7.3; nitrogen, 15.4 to 16.5; oxygen, 20.9 to 23.5; sulphur, 0.8 to 1.6. They are soluble in alkalies, mineral acids, acetic acid, and in a degree in water; insoluble in ether, and nearly so in alcohol. Strong alkalies change them to leucine, tyrosine, oxalic acid, carbonic acid, ammonia, etc., according to temperature. In solutions they are precipitated by excess of mineral acids, by potassic ferrocyanide, with acetic or hydrochloric acid, by acetic acid in presence of a considerable quantity of alkaline or alkaline-earthly salt, gum arabic or dextrine, by mercuric nitrate, or Millon's reagent.

**ALBUMINURIA**, or **BRIGHT'S DISEASE**, albumen in the urine, with dropsical tendency, and organic change in the substance of the kidneys. Acute A. may commence with a chill followed by fever, dry skin, furred tongue, and rapid pulse; sometimes the countenance, or even the whole body, is swollen; urine greatly diminished, and dark red, as if bloody; dull pain about the loins, pallid skin, and thirst; loss of appetite, nausea, and vomiting. Rarely is there a complete suppression of urine, which is almost certainly fatal. Tested by heat and nitric acid, the urine shows so much albumen as to change almost into a mass of jelly. Under the microscope the sediment of the urine shows blood corpuscles, renal epithelium, and small fibrinous casts of the uriniferous tubes, containing entangled in them epithelial cells and blood globules. The causes of acute A. are exposure to cold, especially when the body is exhausted by fatigue, recent illness, or unsuitable diet; but excessive indulgence in alcoholic liquors is the most fruitful cause. Other diseases, in which the blood is in an altered condition, are sometimes preceded or followed by A., as acute rheumatism, typhus fever, erysipelas, and purpura; it may also follow scarlet fever, when it generally terminates favorably. No patient can be considered safe from A. so long as any trace of albumen can be found in the urine. The treatment is easy; let the patient put on flannel, and stay in bed, if possible, in an evenly heated room, carefully guarding against exposure or cold currents of air; diet to be simple and digestible, and not over-plentiful; on or near recovery, preparations of iron are useful to improve the blood and impart strength.

*Chronic A.* is sometimes thoroughly seated before suspected, and persons have died as was supposed from apoplexy, when the real cause was long-established albuminuria. But usually the symptoms are clear: loss of flesh, strength, and appetite, or, if appetite hold, flatulence and dyspeptic symptoms; the body becomes pallid, sallow, and looks waxy; the skin dry; swellings under the eyes, particularly in the morning, and the ankles cedematous at night; pain in the back, but generally not severe; there is irritability of the bladder, and a frequent desire to urinate; urine sometimes copious, but often less than average, pale and of low specific gravity, from 1.004 to 1.012. On test the quantity of albumen in the urine varies; sometimes it is large, often only a trace,

or hardly that. As the disease goes on, dropsy of the abdomen is apt to occur and be the chief cause of suffering; anasarca is present, and all the cellular tissue is infiltrated with serum. There is a tendency to sleep which may lapse into coma, or alternate with epileptic convulsions. Bronchitis is apt to occur in severe form, or pneumonia to come insidiously and run rapidly to a fatal issue; rheumatism is not infrequent. The variety of diseases which collect in a case of chronic A. is of course in consequence of the condition of the blood—the alterations in the blood being the diminished amount of globules, the hematine sometimes reaching only a third of its proper quantity, and the presence of urea. The duration of the disease varies: those exposed to the weather and who lack the comforts of life, often die suddenly, while in persons in condition to avoid exposure and fatigue it may last for years, leaving the victims a good degree of the enjoyments of life; but their situation is always precarious, and serious or fatal disease may at any moment come on from trifling causes. The main cause of chronic A. is intemperance in eating or drinking, but especially in the use of distilled and fermented liquors. Exposure to cold, wet, fatigue, want, and mental anxiety are occasionally causes, and there are cases where no cause can be traced. Where neither dropsy, nor other difficult complications demand attention, the treatment should be more in careful clothing, diet, and exercise than in medicines. Flannel next the skin is indispensable, and exposure to wet and cold must be guarded against; unusual exercise, physical or mental, is forbidden; diet should be moderate and nutritious, and above all taken with regularity; fermented liquors should be avoided, although if long habit render them necessary the patient should select that which best agrees with him. See BRIGHT'S DISEASE, *ante*.

**ALBUNOL**, a t. of Spain, in the province of Granada, 41 m. s.e. from Granada, and about 3 m. from the coast of the Mediterranean. It is a well-built t., with clean paved streets. The surrounding district abounds in vineyards, and is also very productive of figs and almonds. The making of wine and brandy and the drying of raisins are the chief occupations of the inhabitants of the t. itself. Pop. 6764. The port of A. is a small place called La Rabita.

**ALBUQUERQUE**, a t. of Estremadura, Spain, in the province of Badajoz, and 24 m. n. from Badajoz. It is a decaying place. Cotton and woolen fabrics are manufactured, also earthenware, soap, and chocolate. The neighborhood is fruitful, producing corn, wine, oil, flax, honey, and fruits. Pop. 5470.

**ALBUQUERQUE**, a t. of Bernalillo co., New Mexico, U. S., on the left bank of the Rio Bravo del Norte, 41 m. s.s.w. from Santa Fé. Pop. '70, 1307.

**ALBUQUERQUE**, ALFONSO THE GREAT, viceroy of the Indies, and also called the Portuguese Mars, was b. in 1452, near Alhandra, a t. not far from Lisbon, of a family of the royal blood of Portugal. In that age the Portuguese people were distinguished for heroism and a spirit of adventure. They had discovered and subjugated a great part of the western coast of Africa, and were beginning to extend their dominion over the seas and the people of India A. being appointed viceroy of these new possessions, landed on the coast of Malabar, on Sept. 26, 1503, with a fleet and some troops; conquered Goa, which he made the seat of the Portuguese government, and the center of its Asiatic commerce; and afterwards the whole of Malabar, Ceylon, the Sunda isles, the peninsula of Malacca, and (in 1515) the island of Ormuz at the entrance of the Persian gulf. When the king of Persia sent for the tribute which the princes of this island had formerly rendered to him, A. presented bullets and swords to the ambassador, saying: "This is the coin with which Portugal pays her tribute." He made the Portuguese name profoundly respected among the princes and people of the east; and many of them, especially the kings of Siam and Pegu, sought his alliance and protection. All his undertakings bore the stamp of an extraordinary mind. He maintained strict military discipline, was active, far-seeing, wise, humane and equitable, respected and feared by his neighbors, while beloved by his subjects. His virtues made such an impression on the Indian people, that long after his death they resorted to his grave, to implore his protection against the misgovernment of his successors. Notwithstanding his valuable services, A. did not escape the envy of the courtiers and the suspicions of king Emmanuel, who appointed Lopez Soarez, a personal enemy of A., to supersede him as viceroy. This ingratitude affected him deeply. Ishmael, the shah of Persia, offered his assistance to resist the arbitrary decree of the Portuguese court; but A. would not violate his allegiance. A few days after, commending his son to the king in a short letter, he died at sea near Goa, Dec. 16, 1515. Emmanuel honored his memory by a long repentance, and raised his son to the highest dignities in the state. His life is well portrayed in the *Commentarios do Grande Alfonso de A.* (Lisbon, 1576 and 1774), published by his son Blasius.

**ALBURG**, a t. in Grand Isle co., Vermont; pop. '70, 1716. It has an alkaline and mineral spring, the waters of which are said to be useful in gout and rheumatism.

**ALBURNUM**, or SAPWOOD, in botany, is that part of the wood of exogenous trees which is still imperfectly hardened, and, consisting of the woody layers most recently formed, is interposed between the bark (q.v.) and the heart-wood or duramen (q.v.). There is often a very marked division between it and the duramen in trees whose age is such that the latter has been perfected. The A. differs from the duramen in having its tubes

still open for the passage of fluids; and these tubes appear to be the vessels which chiefly serve for the ascent of the sap (see SAP.). It gradually hardens, and is transformed into duramen, new layers being added externally. It is almost always of a white or very pale color, whilst in many trees the duramen is highly colored. The A. is pale even in ebony, in which the duramen is black. In general, the A. is much inferior in value to the hardened or perfected wood, and the different proportions which they bear to each other in the thickness of the stem, go far to determine the relative values of some kinds of trees. These proportions, however, are different not only in trees of different kinds, but even in trees of the same kind at different ages, and according as circumstances have been favorable or otherwise to rapidity of growth. When there is a great proportion of A. the wood dries slowly, and with difficulty, owing to the quantity of sap it contains.

ALCA and ALCADÉ. See ATK.

ALCÆUS, of Mitylene, one of the greatest lyric poets of Greece, flourished about the end of the 7th or the beginning of the 6th c. B.C. His odes in the Æolic dialect are occupied with his grief for the dissensions of his country, his hatred of tyrants, his own misfortunes, and the sorrows of exile; while on other occasions he celebrates the praises of love and wine. He is said to have been an admirer of Sappho, who was a contemporary. A. himself took part in the civil war, first as the condjutor of Pittacus, but afterwards against him, when he proved tyrannical. Being banished from Mitylene, he endeavored, at the head of the other exiles, to force his way back; but in this attempt he fell into the hands of Pittacus, who, however, granted him his life and freedom. He was the inventor of the form of verse which after him is called the Alcaic, and which Horace, the happiest of his imitators, transplanted into the Latin language. Of the ten books of A.'s odes, only fragments remain, which are collected in the *Cambridge Museum Criticum* and in Bergk's *Poetæ Lyrici Græci* (Leip. 1843).

ALCAICS, the name of certain kinds of verse, from Alcaeus, their reputed originator. One kind is of five feet, viz, a spondee or iambic, an iambic, a long syllable, and two dactyls; the second kind of two dactyls and two troches. The A. ode is composed of several strophes, each of four verses, the first two of which are always alcaics of the first kind; the third verse is an iambic dimeter-hypercatalectic, consisting of four feet and a long syllable; and the fourth verse is an alcaic of the second kind. Ex:

Non possidentum multa vocaveris  
Recte beatum; rectius occupat  
Nomen beati, qui deorum  
Muneribus sapientur uti.

ALCAÏDE, or ALCAYDE, a Moorish title, applied by Spanish and Portuguese writers to a military officer having charge of a fortress, prison, or town. It is to be distinguished from Alcalde, which indicates a civil officer.

ALCALA DE GUADAIIRA (*the castle of the Guadaira*), the ancient Carthaginian *Hien-ippa* ("place of many springs"), a t. of Andalusia, Spain, in the province of Seville, and 7 m. e. by s. from Seville. It stands near the Guadaira, partly on a hill, so that some of the streets are very steep, and is overlooked by the ruins of an ancient Moorish castle, once one of the most important, as its ruins are still among the finest in Spain. This t. is beautifully situated, and on account of the salubrity of its climate is much resorted to as a summer residence by the inhabitants of Seville. It is celebrated for producing the finest bread in Spain; there are more than fifty bakeries in the t., and Seville is chiefly supplied from it. The water-mills and mule-mills for making flour are more than 200 in number, and, with the bakeries, give employment to a great part of the population. Every process connected with the making of bread is conducted with the greatest care. Seville is also supplied with water from the hill above A., which is perforated by tunnels, some of them 6 m. in length, forming underground canals. Some of the tunnels are believed to be Roman works, but most of them are known to have been made by the Moors. The water flowing through the subterranean canals is as clear as crystal. The neighborhood of A., is fertile, producing corn, wine, oil, silk, honey, and fruits, also sheep and oxen. Pop. 7000.

ALCALA DE HENARES (*El Calat*, in Arabic, means "the castle"), a t. in Spain, in the province of New Castile, situated on the Henares, 22 m. from the capital, pop. 8600. It is built in the old style, and boasts of a university, which was founded by cardinal Ximenes in 1510, and once enjoyed a world-wide fame, second to that of Salamanca alone. When Francis I. visited it, while a prisoner in Spain, he was welcomed by 11,000 students. The library contains the original of the celebrated polyglot Bible which was printed in this t., and called the Complutensian, from the ancient name of the place (Complutum). A. has, besides, a military academy, and a celebrated powder and leather factory. It is said to have been the birthplace of Cervantes, and various other distinguished persons.—There are several other towns in Spain which bear the name of ALCALA; as A. of Chisberte, in Valencia (pop. 6000); A. de Guadaira, near Seville (5200), and A. la Real, in Jaen (10,000), with superior wine, fruit, sheep, etc.

ALCALA LA REAL (*the Royal Castle*), a city of Andalusia, Spain, in the province of Jaen, and 26 m. n.w. from Granada. It is situated on a conical hill, in a narrow valley, on the n. side of the mountains which separate the province of Jaen from that of Gran-

ada, at an elevation of nearly 8000 ft above the sea. It is a very picturesque t., irregularly built, with steep and narrow streets and bold towers. It was the stronghold of the alcaide Ibn Zaide; and being taken in 1340, by Alonzo XI. in person, it obtained the name *Real*. It has a hospital, formerly an abbey, a very fine building. The neighborhood produces grain and fruits of the finest quality, and the inhabitants of the t. are mostly engaged in agriculture. There is some trade in wine and wool. Pop. 11,521.

**ALCALDE**, a corruption of the Arabic *el-cadi*, "the judge," a word introduced by the Moors. It is still used in Spain as the general title of judicial and magisterial office, the special function being denoted by another term. Thus, there are *alcaldes de aldea*, village-justices; *alcaldes pedaneos*, justices of the peace; *alcaldes de corte*, judges of the court, etc.

**ALCAMENES**, lived 448 to 400 B.C., a famous Athenian sculptor, pupil of Phidias, commended for skill in his art by Cicero, Pliny, and others. With Phidias and Polyctetus, he formed the great triumvirate of Greek sculptors. He is said to have competed with his master in creating statues of Minerva, but overlooked the height at which his was to be seen and made it too small, though otherwise perfect. The "Venus Urania" in the temple at Athens was his masterpiece.

**ALCAMO**, a t. of Sicily, in the province of Trapani, and 23 m. e. from Trapani, in the Val di Mazzara, on the high-road between Palermo and Trapani. It is said to have been founded by the Arabs, on their first invasion of Sicily in 827. The original t. stood on a hill, and long retained a Moslem population, who were driven out by the emperor Frederick II. in 1223, and the new t. was built at the foot of the hill. A. is surrounded by a battlemented wall of the 14th c. The houses are mostly mean, and the streets irregular and dirty; the whole place having an air of poverty and decay. It contains, however, some fine old churches and palaces. Pop. '72, 20,890.

**ALCAÑIZ**, a t. of Aragon, Spain, in the province of Teruel, 63 m. s.e. from Saragossa. It is situated on a rising ground on the right bank of the Guadalupe, which is here crossed by a bridge of nine arches. It is a well-built t., with wide paved streets, and a number of squares. It has a magnificent collegiate church, in which are many fine tombs and pictures. There are manufactures of silk, woollen, and coarse linen fabrics, hats, and soap; there are also flour and oil mills, and some trade in grain, cattle, and the manufactures of the t. Pop. 6400.

**ALCAN'TARA** (*Al-kuntarah*, Arabic, "the bridge"), the Norba Cæsarea of the Romans, an old fortified Spanish t., built by the Moors in the province of Estremadura. The present population is about 4000. It was plundered by the French under general Lapisse in 1809. The bridge from which it takes its name was built for Trajan, 105 A.D. It consists of 6 arches, the 2 central ones with a span of 110 ft.; the whole length is 670, and the height 210 ft. This remarkable structure was partially blown up by the English in 1812, and was again destroyed during the civil war of 1836; and though it might be easily repaired, it is left in a state of ruin, the lazy Spaniards being ferried over in a lumbering boat.

THE ORDER OF A. (formerly St. Julian), one of the religious orders of Spanish knight-hood, was founded (1156) as a military fraternity for the defense of Estremadura against the Moors. In 1197, Pope Celestine III. raised it to the rank of a religious order of knighthood; bestowed great privileges on it, and charged it with the defense of the Christian faith, and the maintenance of eternal war with the infidel. Alphonso IX., having taken the t. of A., ceded it in 1218 to the order of Calatrava (q.v.); but the knights of this order, unable to hold it along with their other great possessions, yielded it to the knights of St. Julian, who transferred it to their seat, and henceforth were known by its name. At length the grand-mastership of the order was, by pope Alexander VI., united to the Spanish crown in 1495. The order is still richly endowed. The knights, who follow the rule of St. Benedict, take now only the vows of obedience and poverty, having, since 1540, been absolved from that of celibacy. A special vow binds them to defend the immaculate conception of the virgin. At their nomination, they must prove four generations of nobility. For a time, the knights of A. acknowledged the superiority of the knights of Calatrava, but they were latterly absolved from it. Both the costume, however, and the cross are still the same, with the exception of the color, which is green. The crest of the order is a pear-tree.

**ALCAN'TARA**, a seaport t. of Brazil, in the province of Maranhão, 17 m. n.w. from Maranhão, near the mouth of the bay of St. Marcos. Most of the houses are only of one story. The more wealthy residents are mostly cotton-planters; the poorer classes live chiefly by fishing, and by making hammocks of some of the peculiar fibers of the country. There are salt-pits not far from the t. Cotton, rice, and salt are exported. Pop. 10,000.

**ALCARAZ**, a t. of La Mancha, Spain, in the province of Albacete, and 36 m. w.s.w. from Albacete. It stands on the slope of an isolated hill, on the left bank of the Guadarmena, a feeder of the Guadalquivir. A ruined castle crowns the summit of the hill; and there are also the remains of a fine Roman aqueduct. Some of the streets are very steep. The inhabitants are partly employed in weaving and iron-working, partly in agriculture. Pop. 7325.

**ALCATRAZ**, or **PELICAN ISLAND**, in the bay of San Francisco, n.w. of the city, fortified by the federal government, and having a light-house on its highest ground. The island is less than a third of a mile in length. It commands the entrance to the bay.

**ALCAUDETE** (anc. *Ullitunum*), a t. of Andalusia, Spain, in the province of Jaen and 22 m. s.w. from Jaen. It is situated in a hollow, enclosed by three hills, on an affluent of the Guadalquivir, is overlooked by the ruins of an ancient castle, and is tolerably well built. There are fine pictures in some of the churches. Oil and rope making, weaving, and agriculture are the chief employments of the inhabitants. Grain, silk, oxen, sheep, goats, pigs, mules, and asses are produced in the neighborhood. Pop. 6242.

**ALCAVALA**, or **ALCABA'LA**, a duty formerly charged in Spain and her colonies on transfers of property, whether public or private. It was begun in 1341 by Alphonso XI, at 10 and increased to 14 per cent of the selling price of all commodities, raw or manufactured, and charged as often as they were sold or exchanged. This monstrous impost was enforced, nearly ruining the commerce of the kingdom, down to the invasion of Napoleon. Catalonia and Arragon purchased from Philip V. exemption from the tax, and, though still burdened heavily, were in a flourishing state in comparison with districts covered by the Alcovalla.

**ALCAZAR DE SAN JUAN** (anc. *Alee*), a t. of New Castile, Spain, in the province of Ciudad Real, and 49 m. n.e. from Ciudad Real on the Madrid and Alicante railway. It is regularly built, and has two good squares. There are manufactories of soap, nitre, and gunpowder. Pop. 7540.

**ALCAZAR KEBIR**, a city of Morocco, 80 m. n.w. of Fez; once famous as the rendezvous for Moorish invasions of Spain, but now greatly decayed. Not far from the city is the river Elmahassen, where, in 1578, the Moors defeated the Portuguese, and killed their king, Sebastian. Pop. 6900.

**ALCEDO**. See KINGFISHER.

**ALCHEMIL'LA**. See LADY'S MANTLE.

**ALCHEMY** is to modern chemistry what astrology is to astronomy, or legend to history. In the eye of the astrologer, a knowledge of the stars was valuable only as a means of foretelling, or even of influencing, future events. In like manner, the genuine alchemist toiled with his crucibles and alembics, calcining, subliming, distilling, not with a view to discover the chemical properties of substances, as we understand them, but with two grand objects, as illusory as those of the astrologer—to discover, namely, (1) *the secret of transmuting the baser metals into gold and silver*, and (2) *the means of indefinitely prolonging human life*.

Tradition points to Egypt as the birthplace of the science. Hermes Trismegistus (q.v.) is represented as the father of it; and the most probable etymology of the name is that which connects it with the most ancient and native name of Egypt, *Chem* (the Scripture Cham or Ham). The Greeks and Romans under the empire would seem to have become acquainted with it from the Egyptians; there is no reason to believe that, in early times, either people had the name or the thing. *Chemia* (Gr. *chemia*) occurs in the lexicon of Suidas, written in the 11th c., and is explained by him to be "the conversion of silver and gold." It is to the Arabs, from whom Europe got the name and the art, that we owe the prefixed article *al*. As if *chemia* had been a generic term embracing all common chemical operations, such as the decocting and compounding of ordinary drugs, the grand operation of transmutation was denominated the *chemia* (*al*-chemy)—the chemistry of chemistries. The Roman emperor Caligula is said to have instituted experiments for the producing of gold out of orpiment (sulphuret of arsenic); and in the time of Diocletian, the passion for this pursuit, conjoined with magical arts, had become so prevalent in the empire, that that emperor is said to have ordered all Egyptian works treating of the chemistry of gold and silver to be burnt. For at that time, multitudes of books on this art were appearing, written by Alexandrine monks and by hermits, but bearing famous names of antiquity, such as Democritus, Pythagoras, and Hermes.

At a later period, the Arabs took up the art; and it is to them that European A. is directly traceable. The school of polypharmacy, as it has been called, flourished in Arabia during the caliphates of the Abbasides. The earliest work of this school now known is the *Summa Perfectionis*, or "Summit of Perfection," composed by Gebir (q.v.) in the 8th c.; it is consequently the oldest book on chemistry proper in the world. It contains so much of what sounds very much like jargon in our ears, that Dr. Johnson ascribes the origin of the word "gibberish" to the name of the compiler. Yet when viewed in its true light, it is a wonderful performance. It is a kind of text-book, or collection of all that was then known and believed. It appears that these Arabian polypharmists had long been engaged in firing and boiling, dissolving and precipitating, subliming and coagulating chemical substances. They worked with gold and mercury, arsenic and sulphur, salts and acids; and had, in short, become familiar with a large range of what are now called chemicals. Gebir taught that there are three elemental chemicals—mercury, sulphur, and arsenic. These substances, especially the first two, seem to have fascinated the thoughts of the alchemists by their potent and penetrating qualities. They saw mercury dissolve gold, the most incorruptible of matters, as water

dissolves sugar; and a stick of sulphur presented to hot iron penetrates it like a spirit, and makes it run down in a shower of solid drops, a new and remarkable substance, possessed of properties belonging neither to iron nor to sulphur. The Arabians held that the metals are compound bodies, made up of mercury and sulphur in different proportions. With these very excusable errors in theory, they were genuine practical chemists. They toiled away at the art of making "many medicines" (polypharmacy) out of the various mixtures and reactions of such chemicals as they knew. They had their pestles and mortars, their crucibles and furnaces, their alembics and aludels, their vessels for infusion, for decoction, for cohabitation, sublimation, fixation, lixiviation, filtration, coagulation, etc. Their scientific creed was transmutation, and their methods were mostly blind gropings; and yet, in this way, they found out many a new body, and invented many a useful process.

From the Arabs A. found its way through Spain into Europe, and speedily became entangled with the fantastic subtleties of the scholastic philosophy. In the middle ages, it was chiefly the monks that occupied themselves with A. Pope John XXII. took great delight in it, though it was afterwards forbidden by his successor. The earliest authentic works on European A. now extant are those of Roger Bacon (b. 1214, d. 1284) and Albertus Magnus (b. 1205, d. 1280). Roger Bacon (q.v.) appears rather the earlier of the two as a writer, and is really the greatest man in all the school. He was acquainted with gunpowder. Although he condemns magic, necromancy, charms, and all such things, he believes in the convertibility of the inferior metals into gold, but does not profess to have ever effected the conversion. He had more faith in the elixir of life than in gold-making. He followed Gebir in regarding portable gold—that is, gold dissolved in nitro-hydrochloric acid or *aqua regia*—as the elixir of life. Urging it on the attention of pope Nicholas IV., he informs his holiness of an old man who found some yellow liquor (the solution of gold is yellow) in a golden vial, when plowing one day in Sicily. Supposing it to be dew, he drank it off. He was thereupon transformed into a hale, robust, and highly accomplished youth. Bacon no doubt took many a dose of this golden water himself.—Albertus Magnus (q.v.) had a great mastery of the practical chemistry of his times; he was acquainted with alum, caustic alkali, and the purification of the royal metals by means of lead. In addition to the sulphur-and-mercury theory of the metals, drawn from Gebir, he regarded the element water as still nearer the soul of nature than either of these bodies. He appears, indeed, to have thought it the primary matter, or the radical source of all things—an opinion held by Thales, the father of Greek speculation.—Thomas Aquinas (q.v.) also wrote on A., and was the first to employ the word *algalan* (q.v.).—Raymond Lully (q.v.) is another great name in the annals of A. His writings are much more disfigured by unintelligible jargon than those of Bacon and Albertus Magnus. He was the first to introduce the use of chemical symbols (q.v.), his system consisting of a scheme of arbitrary hieroglyphics. He made much of the spirit of wine (the art of distilling spirits would seem to have been then recent), imposing on it the name of *aquae vitæ ardens*. In his enthusiasm, he pronounced it the very elixir of life. One of the most celebrated of the alchemists was Basil Valentine (q.v.), b. 1394, who introduced antimony into medical use. He, along with some previous alchemists, regarded salt, sulphur, and mercury as the three bodies contained in the metals. He inferred that the philosopher's stone must be the same sort of combination—a compound, namely, of salt, sulphur, and mercury; so pure, that its projection on the baser metals should be able to work them up into greater and greater purity, bringing them at last to the state of silver and gold. His practical knowledge was great; he knew how to precipitate iron from solution by potash, and many similar processes, so that he is ranked as the founder of analytical chemistry.

But more famous than all was Paracelsus (q.v.), in whom A. proper may be said to have culminated. He held, with Basil Valentine, that the elements of compound bodies were salt, sulphur, and mercury—representing respectively earth, air, and water, fire being already regarded as an imponderable—but these substances were in his system purely representative. All kinds of matter were reducible under one or other of these typical forms; everything was either a salt, a sulphur, or a mercury, or, like the metals, it was a "mixt" or compound. There was one element, however, common to the four; a fifth essence or "quintessence" of creation; an unknown and only true element, of which the four generic principles were nothing but derivative forms or embodiments: in other words, he inculcated the dogma that there is only one real elementary matter—nobody knows what. This one prime element of things he appears to have considered to be the universal solvent of which the alchemists were in quest, and to express which he introduced the term *alcahest*—a word of unknown etymology, but supposed by some to be composed of the two German words *alle geist*, "all spirit." He seems to have had the notion that if this quintessence or fifth element could be got at, it would prove to be at once the philosopher's stone, the universal medicine, and the irresistible solvent.

After Paracelsus, the alchemists of Europe became divided into two classes. The one class was composed of men of diligence and sense, who devoted themselves to the discovery of new compounds and reactions—practical workers and observers of facts, and the legitimate ancestors of the positive chemists of the era of Lavoisier. The other class took up the visionary, fantastical side of the older A., and carried it to a degree of extravagance before unknown. Instead of useful work, they compiled mystical

trash into books, and fathered them on Hermes, Aristotle, Albertus Magnus, Paracelsus, and other really great men. Their language is a farrago of mystical metaphors, full of "red bridgrooms" and "lily brides," "green dragons," "ruby lions," "royal baths," "waters of life." The seven metals correspond with the seven planets, the seven cosmical angels, and the seven openings of the head—the eyes, the ears, the nostrils, and the mouth. Silver was Diana, gold was Apollo, iron was Mars, tin was Jupiter, lead was Saturn, and so forth. They talk forever of the power of attraction, which drew all men and women after the possessor; of the alcahest, and the grand elixir, which was to confer immortal youth upon the student who should approve himself pure and brave enough to kiss and quaff the golden draught. There was the great mystery, the mother of the elements, the grandmother of the stars. There was the *philosopher's stone*, and there was the *philosophical stone*. The philosophical stone was younger than the elements, yet at her virgin touch the grossest calx (ore) among them all would blush before her into perfect gold. The philosopher's stone, on the other hand, was the first-born of nature, and older than the king of metals. Those who had attained full insight into the arcana of the science were styled wise; those who were only striving after the light were philosophers; while the ordinary practitioners of the art were called adepts. It was these visionaries that formed themselves into Rosicrucian societies and other secret associations. It was also in connection with this mock A., mixed up with astrology and magic, that quackery and imposture so abounded, as is depicted by Scott in the character of Brousterswivel in the *Antiquary*. Designing knaves would, for instance, make up large nails, half of iron and half of gold, and lacker them, so that they appeared common nails, and when their credulous and avaricious dupes saw them extract from what seemed plain iron an ingot of gold, they were ready to advance any sum that the knaves pretended to be necessary for pursuing the process on a large scale. It is from this degenerate and effete school that the prevailing notion of A. is derived—a notion which is unjust to the really meritorious alchemists who paved the way for genuine chemistry.

It is interesting to observe that the leading tenet in the alchemists' creed—namely, the doctrine of the transmutability of other metals into gold and silver—a doctrine which it was at one time thought that modern chemistry had utterly exploded—receives not a little countenance from a variety of facts every day coming to light. The multitude of phenomena known to chemists under the name of *allotropy* (q. v.), are leading speculative men more and more to the opinion that many substances hitherto considered chemically distinct, are only the same substance under some different condition or arrangement of its component molecules, and that the number of really distinct elements may be very few indeed. See Kopp's *Geschichte der Chemie*; *Alchmy and the Alchemists*, by Dr. Samuel Brown, in Chambers's *Papers for the People* (No. 66); and the article ALCHEMY in the 9th ed. (1875) of the *Encyclopædia Britannica*.

ALCHEMY (*ante*). Basil Valentine and Paracelsus, recognizing the importance of the strange substances which escaped from the retorts of the masters of A. in the transmutation of bodies, gave them the name of mercury; the elders called them souls or spirits; Van Helmont studied them more closely, and gave them the name of gas. He was acquainted with carbonic acid under the name of woody gas; but his ignorance of the action of the oxygen of the atmosphere prevented him from making the fundamental distinction between experiments performed in a closed vessel and in one open to the air. Priestley, Lavoisier, and Scheele, by the use of the test tube and the balance, weighed and tested the results of ancient A., and thence modern chemistry was born; but the work had already been begun by men of genius, such as Bernard Palissy, Boyle, Homberg, the Geoffreys, Margraff, Bergman, and Roule, the master of Lavoisier, who may be called the Diderot of chemistry. It is also true that the most important discoveries in chemistry have been made by men who combined with chemical experiments a marked taste for alchemic theories; for instance, Glauber, ablest of mystics; Kunkel, who thought he had found in the "shining pills" of his *phosphorus mirabilis* as efficacious a remedy as the potable gold in which he also believed; Glaser, the alchemist, master of Lemery, who has been called the father of chemistry; Robert Fludd, and others. Soon after chemistry was settled as a science there was a crusade in search of the philosopher's stone. Among French seekers was De Lisle, who died in the Bastille of wounds inflicted by his keepers in trying to extort his secret; among Englishmen, Dr. Price, who committed suicide to avoid a public trial of his pretended discoveries. Doubtless the main idea of A. is yet alive. One of the greatest of French chemists, Dumas, thought as to the theoretical possibility of making gold, that a solution might be found in the doctrine of isomerism; and the more famous English savant, Sir Humphrey Davy, refused to decide that the alchemists must be wrong. In 1796 two German physicians founded a society for the investigation of the transmutation of metals, and this society and its branches existed as late as 1820. A text-book of chemistry by Baudrimont (1844) says "a certain Mr. Javary has obtained very surprising results by following the prescriptions of the ancient alchemists, so that there is hope of at last seeing the great work succeed." Another work by Fiffereau (1856) affirms that the metals are compound bodies, and that silver can be changed into gold. The literature of A. is enormous, including such names as Roger Bacon, Lord Bacon, Becher, Fludd, Hermis, Trisnegisti, Glauber, Kunkel, Paracelsus, Quercetean, Basil Valentine, Peter Gregory, etc., not to mention Greek, Roman, and Arabic writers.

**ALCIBIADES**, **ALCIBIADES**, 1492-1550; an Italian jurist, skillful in his exposition of the laws, for which he is praised by De Thou. He published many legal works, annotations on Tacitus, and *Emendans* or moral sayings in Latin verse, greatly admired. His *History of Milan* was published in 1625.

**ALCIBIADES**, a son of Clinias and Dinomache, b. at Athens, 450 B.C. He lost his father in the battle of Cheronea, and was in consequence educated in the house of Pericles, his uncle. In his youth he gave evidence of his future greatness, excelling both in mental and bodily exercises. His handsome person, his distinguished parentage, and the high position of Pericles, procured him a multitude of friends and admirers. Socrates was one of the former, and gained considerable influence over him; but was unable to restrain his love of luxury and dissipation, which found ample means of gratification in the wealth that accrued to him by his union with Hipparete, the daughter of Hipponicus. His public displays, especially at the Olympic games, were incredibly expensive. He bore arms for the first time in the expedition against Potidea (432 B.C.), where he was wounded, and where his life was saved by Socrates—a debt which he liquidated eight years after at the battle of Delium, by saving, in his turn, the life of the philosopher; but he seems to have taken no part in political matters till after the death of the demagogue Cleon, when Nicias brought about a treaty of peace for fifty years between the Athenians and Lacedæmonians. A., jealous of the esteem in which Nicias was held, persuaded the Athenians to ally themselves with the people of Argos, Elis, and Mantinea, and did all in his power to stir up afresh their old antipathy to Sparta. It was at his suggestion that they engaged in the celebrated enterprise against Sicily, to the command of which he was elected, along with Nicias and Lamachus. But while preparations were being made, it happened during one night that all the statues of Mercury in Athens were mutilated. The enemies of A. threw the blame of this mischief upon him, but postponed the impeachment till he had set sail, when they stirred up the people against him to such a degree that he was recalled, in order to stand his trial. On his way home, he landed at Thurii, fled, and betook himself to Sparta, where, by conforming to the strict manners of the people, he soon became a favorite. He induced the Lacedæmonians to send assistance to the Syracusans, persuaded them to form an alliance with the king of Persia, and after the unfortunate issue of the Athenian expedition in Sicily, to support the people of Chios in their endeavors to throw off the yoke of Athens. He went thither himself, and raised all Ionia in revolt against that city. But Agis and the other leading men in Sparta, jealous of the success of A., ordered their generals in Asia to have him assassinated. A. discovered this plan, and fled to Tissaphernes, a Persian satrap, who had orders to act in concert with the Lacedæmonians. He now resumed his old manners, adopted the luxurious habits of Asia, and made himself indispensable to Tissaphernes. He represented to the latter that it was contrary to the interests of Persia entire to disable the Athenians. He then sent word to the commanders of the Athenian forces at Samos that he would procure for them the friendship of the satrap if they would control the extravagance of the people, and commit the government to an oligarchy. This offer was accepted, and Pisander was sent to Athens, where he got the supreme power vested in a council of 400 persons. When it appeared, however, that this council had no intention of recalling A., the army at Samos chose him as their commander, desiring him to lead them on instantly to Athens, and overthrow the tyrants. But A. did not wish to return to his native country till he had rendered it some service, and he accordingly attacked and defeated the Lacedæmonians both by sea and land. Tissaphernes now ordered him to be arrested at Sardis on his return, the satrap not wishing the king to imagine that he had been accessory to his doings. But A. found means to escape; placed himself again at the head of the army; beat the Lacedæmonians and Persians at Cyzicus; took Cyzicus, Chalcedon, and Byzantium; restored to the Athenians the dominion of the sea; and then returned to his country (407 B.C.), to which he had been formally invited. He was received with general enthusiasm, as the Athenians attributed to his banishment all the misfortunes that had befallen them.

The triumph of A., however, was not destined to last. He was again sent to Asia with 100 ships; but not being supplied with money for the soldiers' pay, he was obliged to seek assistance at Caria, where he transferred the command in the meantime to Antiochus, who being lured into an ambuscade by Lysander, lost his life and part of the ships. The enemies of A. took advantage of this to accuse him and appoint another commander. A. went to Thrace, where he lived in voluntary exile in Pactya, one of the castles which he had built out of his earlier spoils. But being threatened here with the power of Lacedæmonia, he removed to Bithynia, with the intention of repairing to Artaxerxes, to gain him over to the interests of his country. At the request of the thirty tyrants of Athens, and with the concurrence of the Spartans, Pharnabazus, a satrap of Artaxerxes, received orders to put A. to death. He was living at this time in a castle at Phrygia; Pharnabazus ordered it to be set on fire during the night, and as his victim was endeavoring to escape from the flames, he was pierced with a volley of arrows. Thus perished A. (404 B.C.), about the 45th year of his age. He was singularly endowed by nature, being possessed of the most fascinating eloquence (although he could not articulate the letter *r*, and stuttered in his speech), and having in a rare degree the talent to win and to govern men. Yet in all his transactions, he allowed himself to be directed by external circumstances, without having any fixed principles of conduct.

On the other hand, he possessed that boldness which arises from conscious superiority, and shrunk from no difficulty, because he was never doubtful concerning the means by which an end might be attained. His life has been written by Plutarch and Cornelius Nepos.

ALCINOUS, a mythical king of the Phæacians, grandson of Neptune. He was immortalized in the *Odyssey* for the relief and entertainment extended to Ulysses by his daughter Nausicaa. The subjects of A. loved pleasure, but they were skilful seamen, and he is described as having been a good prince.

ALCIPHON, a Greek epistolary writer, probably contemporary with Lucian. His letters, 116 of which have been published, are in pure Attic dialect, and are considered models of style. The imaginary authors are common people, fishermen, courtiers, and parasites. The letters are valuable as picturing Athenian private life at that period.

ALCIRA (anc. *Sebaticula*), a t. of Spain, in the province of Valencia, 20 m. s. by w. from Valencia, on an island in the river Xucar, the two branches of which are here crossed by stone bridges. It is surrounded by old walls, with strong towers. The principal streets are wide, but the t. is ill built. The inhabitants are chiefly employed in the manufacture of earthenware, the production of silk, and agriculture. The surrounding country is much intersected by canals, exhibiting an admirable specimen of the system of irrigation introduced by the Moors. Pop. 15,490.

ALCMÆON, in Greek legend, son of Amphiaraus and Eriphyle, and brother of Amphilochus. He was a leader of the Epigoni who went against Thebes to revenge the death of their fathers in the war of the seven. After the fall of Thebes, A. killed his mother, as he had been ordered by his father. For this act madness came upon him, and he was always pursued by the furies. He married Arsinoë, daughter of Phlegon, king of Psophis, and also Calirrhoe, daughter of the river-god Achelous. The last wife coveted the necklace and peplus of Harmonia, once belonging to his mother, which he had given to Arsinoë, and he got them from Arsinoë by the false pretense of wishing to dedicate them at Delphi in hope to cure his madness. When his father-in-law heard that he had got the treasures for his new wife, he sent his sons, who killed A.; but A.'s sons by Calirrhoe took bloody vengeance, at her instigation. After his death A. seems to have been worshiped, and had altars at Thebes and elsewhere; his tomb was shown at Psophis, and he had a statue at Delphi.

ALCMÆON, a Greek natural philosopher of the latter part of the 6th c. B.C., b. in Crotona, s. Italy, and said to have been a pupil of Pythagoras. He was the first who practiced dissection of animals; but it is a question whether he ever operated on a human body. He thought the human soul was immortal, because, like the heavenly bodies, it contained within itself a principle of motion. The eclipses of the moon he thought were occasioned by her shape, like that of a boat.

ALC'MAN, an ancient lyric poet, was born at Sardis, the capital of Lydia, in Asia Minor, but lived first as a slave, and afterwards as a freeman in Sparta. He is the earliest erotic poet, and is said to have introduced some new metrical forms called *Alcmanica metra*. He composed in the Doric dialect a poem on the Dioscuri, Parthenia, or songs sung by choruses of virgins, bridal-hymns, verses in praise of love and wine, etc. We possess only a few fragments of A., nor do these justify the high opinion entertained of his merits by the ancients, though some of them exhibit considerable beauty. A. d. of a loathsome disease (*morbus pedicularis*).

ALCME'NE, in Greek mythology, daughter of Electryon, king of Mycenæ, and wife of Amphytrion; mother of Hercules, by Jupiter, who came to her in the form of her husband. She was the mother of Iphicles by Amphytrion.

ALCO, a variety of dog, domesticated in Mexico and Peru before the discovery of America by Europeans, and also found in a wild state in these countries. But whether it is originally a native of them, or has escaped from domestication, is uncertain, nor is the variety well known to naturalists. It is described as having a very small head and pendulous ears: the latter being in dogs one of the ordinary results of domestication. Humboldt supposed it to be allied to the shepherd's dog. It has been attempted to elevate it into a species under the name of *canis A.* It is not improbable that the name A. was given to more varieties than one.

ALCOCK, Sir RUTHERFORD, b. London, 1809; British diplomatist and author. He held various posts in the naval, medical, and diplomatic services in Spain, 1833-44; and was British consul at Foo-chow, Shanghai and Canton in China; consul-general to Japan, 1859; and later, minister plenipotentiary. Owing to the ignorance then existing concerning the true relations of the tycoon and the mikado—that of vassal, instead of equal—his course was beset with many difficulties, and attempts were made upon his life in 1860 and 1862. He was one of the four foreign ministers who ordered the bombardment of Shimonoseki, and then exacted an indemnity of \$3,000,000. For this he was recalled. A. was made K.C.B. in 1863, and was minister plenipotentiary to China 1865-71. He is now president of the royal geographical society; and has published *Medical History of*

*the British Legion in Spain, Life's Problems, The Capital of the Tycoon, Three Years in Japan, and Art and Art Industries in Japan.*

**ALCOHOL** is a limpid, colorless liquid, of a hot, pungent taste, and having a slight but agreeable smell. It is the characteristic ingredient of fermented drinks, and gives them their intoxicating quality. Looking at the extraordinary consumption of these liquors, and to the extensive application of A. for other purposes, it becomes one of the most important substances produced by art.

There is only one source of A.—namely, the fermentation of sugar or other saccharine matter. Sugar is the produce of the vegetable world. Some plants contain free sugar, and still more contain starch, which can be converted into sugar. The best vegetable substances, then, for yielding A. are those that contain the greatest abundance of sugar or of starch. See **DIASTASE**, **FERMENTATION**, and **DISTILLATION**.

Owing to the attraction of A. for water, it is impossible to procure pure A. by distillation alone. Common spirits, such as brandy, whisky, etc., contain 50 or 52 per cent of A.; in other words, they are about half A., half water. *Proof-spirit*, which is the standard by means of which all mixtures of A. and water are judged, contains 57.27 per cent by volume, and 49.59 per cent by weight, of A. The specific gravity of proof-spirit is 918.6; and when a spirit is called *above proof*, it denotes that it contains an excess of A.; thus, *spirit of wine*, or rectified spirit, with specific gravity 858, is 54 to 58 over-proof, and requires 54 to 58 per cent of water to be added to it, to bring the strength down to that of proof-spirit; whilst the term *under proof* has reference to a less strong spirit than the standard. See **ARÆOMETER**. The most primitive method of learning the strength of A. was to drench gunpowder with it, set fire to the spirit, and if it inflamed the gunpowder as it died out, then the A. stood the test or proof, and was called proof-spirit. The highest concentration possible by distillation gives 90 per cent of A., still leaving 10 per cent of water. In order to remove this, fused chloride of calcium, quicklime, or fused carbonate of potash, is added to the alcoholic liquid, the whole allowed to stand for twelve hours, and then the spirit may be distilled off quite free from water. Spirit of wine may also be deprived of its remaining water by suspending it in a bladder in a warm place; the bladder allows much of the water to pass through and evaporate, but little of the A. The latter method is called Soemmering's process, and depends on the different degrees of rapidity with which the bladder admits of water and A. passing through it. Thus, introduce into one bladder 8 oz. of water, and into a second, 8 oz. of A., and allow both bladders to be similarly exposed on a sand-bath, till all the water has evaporated through the pore of the membrane, which will be accomplished in about 4 days, and it will then be observed that whilst 8 oz. water have made their exit from the bladder, that only one ounce of A. has thus evaporated, and 7 oz. still remain in the bladder. This experiment explains why smugglers, a few generations ago, could supply a whisky which was stronger, and hence esteemed preferable, as they carried the whisky in bladders around their persons, and the water escaping therefrom in much greater proportion than the A., a stronger spirit was left.

A. is used medicinally, both internally and externally. The more common form for internal use is brandy, and is that generally recommended by physicians. As a *stomachic stimulant*, A. is used in sea-sickness and indigestion. As a *stimulant and restorative*, it is employed with advantage in the later stages of fever. It is also employed internally as a *powerful excitant* to prevent fainting during operations, and to assist in restoration in cases of suspended animation. In cases of diarrhoea, unaccompanied by inflammation, it is often of great benefit. Externally, A. is applied to stop hemorrhage, to harden the cuticle over tender parts, as the nipples of females for some time before delivery, and to feet which have been blistered from long walking or tight-fitting shoes.

Absolute or anhydrous A. has a specific gravity of 793 at the temperature of 60°. It boils at 173°, and has not been frozen by any cold hitherto produced. Reduced to a temperature of -130°, A. becomes of an oily and greasy consistence; at -146° it assumes the aspect of melted wax; and at -166° it gets still thicker, but does not congeal at the lowest attainable temperature. This property of non-freezing at any degree of cold to which the earth is subjected, has led to the employment of A. colored red by cochineal, in the thermometers sent out to the arctic regions. It acts as a poison by abstracting the water from the parts it touches. It is highly inflammable; its combustion yielding only carbonic acid and water. When mixed with water, heat is evolved, and a condensation takes place. The formula of A. is  $C_2H_6O$ . In 100 lbs., therefore, of A., about 53 are carbon, 13 hydrogen, and 34 oxygen. Besides the A. consumed in wine, beer, and spirits, it is much employed in pharmacy and in the arts. It is a powerful solvent for resins and oils; and hence is employed in the preparation of varnishes. In Germany, a cheap spirit made from potatoes is much used for cooking on a small scale. See **METHYLATED SPIRIT**; and **ALCOHOL** and **ALCOHOLS**. The use and abuse of alcoholic drinks will be considered under **FOOD AND DRINK**, and **TEMPERANCE**.

**ALCOHOL, PHYSIOLOGICAL AND POISONOUS ACTION OF.** A. in a concentrated form exerts a local irritant action on the membranes and tissues of the animal body. According to various circumstances, as, for example, its greater or less dilution, the quantity in which it is administered, the emptiness or fullness of the stomach, and the nature of the animal on which the experiment is made, A. may either act as a gentle stimulus,

which assists the digestive process, or it may excite such a degree of irritation as may lead to the disorganization of the mucous membrane. It is well known that dilute A., in contact with animal matter, at a temperature of from 60° to 90°, undergoes acetic fermentation, and it was maintained by Leuret and Lassaigne that a similar change took place in the stomach. It appears, however, that only a small part of the A. undergoes this change; and it is the small part thus changed which produces the penetrating and disagreeable acidity which characterizes the eructations and vomited matters of drunkards. A. is, however, for the most part, rapidly absorbed in an unchanged state, either in the form of liquid or vapor; and this absorption may take place through the cellular (or connective) tissue, the serous cavities, the lungs, or the digestive canal. This is shown by the experiments of Orfila, who fatally intoxicated dogs by injecting A. into the subcutaneous cellular tissue, or by making them breathe an atmosphere charged with alcoholic vapor; and by Rayer, who injected about half an ounce of proof-spirit into the peritoneum of rabbits, which almost immediately became comatose, and died in a few hours. It is, however, only with absorption from the intestinal canal that we have to deal, in relation to man. Almost the whole of this absorption is effected in the stomach, and it is only when A. is taken in great excess, or is mixed with a good deal of sugar, that any absorption beyond the stomach occurs. The rapidity of the absorption varies according to circumstances. The absorption is most rapid when the stomach is empty and the drinker is fatigued; while the action is delayed by a full stomach, and especially by the presence of acids, tannin, or the mucilaginous and saccharine ingredients of many wines. Fatty matters have a similar action, and hence it is that (as we learn from Dr. Perrin's elaborate article on "The Physiology of Alcohol," in the *Dictionnaire Encyclopédique des Sciences Médicales*, vol. ii. p. 577, 1865) "we must account for the English habit of taking a very fat soup, or even a glass of oil, before proceeding *aux libations*." The mode of action of A. on the system, and the various phenomena of drunkenness, are sufficiently described in the article INTOXICATION. Previously to the year 1860, the actual presence of A. in the blood had been attempted to be proved by many chemists, but no satisfactory evidence upon this point had been adduced; and its presence had also been sought for in the expired air and in the secretions, but the results were equally doubtful; and Liebig's view, that A. was oxidized in the blood, and after passing through various stages of oxidation, was finally converted into, and eliminated from, the system as carbonic acid and water, was almost generally accepted. In that year, however, an elaborate work, abounding in well-devised experiments, and entitled *Du Rôle de l'Alcool et des Anesthésiques dans l'Organisme*, was published by three well-known physiological inquirers, MM. Lallemande, Perrin, and Duroy, and received a prize, with high commendation, from the academy of sciences. In this work, it seems to be proved beyond all doubt that "A. stays for a time in the blood, that it exercises a direct and primary action on the nervous centers, whose functions it modifies, perverts, or abolishes, according to the dose; that neither in the blood nor in the expired air are any traces to be found of its transformation or destruction; that it accumulates in the nervous centers, and in the liver; and that it is finally discharged from the system by the ordinary channels of elimination."—Perrin, *op. cit.*, p. 580. So far from carbonic acid being one of its final products, it is now ascertained that A. causes a diminished exhalation of that gas. The A., when it has entered the blood, is diffused over the whole organism, remains during, apparently, different periods in different organs, and almost immediately begins to escape; and if as much wine or spirit is taken as contains 80 grammes, or rather more than 2½ oz. of A., the urine passed some hours afterwards yields, by distillation, an amount of A. capable of burning; and the elimination by this channel continues for 16 hours or more. The elimination by the lungs continues for about 8 hours. The authors believe that in man the chief excreting channel is the skin, but they have no data to show how long this elimination is continued. They further show that when a quantity of *vin ordinaire*, equivalent to half an ounce of A., has been taken by a healthy man, the presence of A. may be readily detected in the blood, the expired air, the urine, and the cutaneous exhalation in the course of half an hour after the wine has been taken. In animals destroyed when intoxicated, the portions of the brain and of the liver are found to yield, weight for weight, considerably more A. than the blood. The fact of the retention and accumulation of A. in the nervous centers and liver, tends to throw much light on the special diseases of drunkards.

The action of any kind of alcoholic drink in moderate doses, is that of a somewhat rapid stimulant. The bodily and mental powers are for a time excited beyond their ordinary strength, after which there is a corresponding depression. Although the A. which is introduced into the system cannot act as a true food (for in that case it would not pass through the system unchanged), it indirectly takes the place of food, by diminishing the wear and tear of the system, and thus rendering less food sufficient: a fact which is proved by chemical experiments, showing that less carbonic acid and urea (which are the ultimate products of the carbonaceous and nitrogenous tissues) are given off when A. is administered in moderation, than when it is totally withheld.

The influence of an excessive dose of A. has been demonstrated by various series of experiments on animals, and unfortunately by many observed cases in man. If a poisonous dose of A. is given to an animal (a dog, for example), its action on the nervous system is the first point that is noticed. The dog ceases to exhibit the ordinary

control over its muscular movements, which seem to be no longer under the influence of the will. It walks with uncertain and doubtful steps, till the hind-legs lose their power, the fore-legs still preserving some activity. The general sensibility becomes more or less abolished, and the animal can no longer see or feel. Soon afterwards the respiration fails; and finally, the circulation is arrested, and life ceases with the last beat of the heart.

As cases are of frequent occurrence in which it is almost impossible for non-professional persons (the police, for example) to distinguish between extreme drunkenness and certain other morbid conditions, as apoplexy, concussion of the brain, and opium-poisoning, it may be practically useful if we lay down a few rules on this subject. In concussion and in very extreme intoxication, there is profound coma or sleepiness; but in the latter case the odor of the breath removes all difficulty of diagnosis. The most difficult cases are those in which the symptoms of concussion or apoplexy are associated with an alcoholic odor of the breath; in such cases the head should be most carefully examined for marks of violence, and every effort should be made to obtain a history of the case from those who had previously seen the patient. In poisoning by opium or laudanum, the peculiar smell of the drug may generally be detected in the breath (a test which, however, fails if morphia has been taken). In poisoning by opium, the face is pale, and the pupils of the eyes are contracted; while in drunkenness, the face is flushed, and the pupils are generally dilated. Another difference (to which Dr. A. S. Taylor calls attention) is this, that while perfect remissions are rare in poisoning by opium, in poisoning with A. the patient often recovers his senses, and subsequently dies. In either kind of poison, the stomach-pump should be used, and the ejected contents of the stomach may facilitate our diagnosis. A sulphate of zinc emetic should be prescribed, if there is no stomach-pump at hand; and after the stomach has been well cleared out, coffee and other strong stimulants should be given.

**ALCOHOLOMETRY** is the process of estimating the percentage of absolute alcohol in a sample of spirits. See **AREOMETER**.

**ALCOHOLS.** During the last few years, our knowledge of the properties of ordinary alcohol and of the general class of bodies to which the term *Alcohols* is applied, in consequence of their resemblance, in certain chemical reactions, to ordinary alcohol, has been very much enlarged. We shall first make a few supplementary additions to the article **ALCOHOL**, and shall then proceed to notice the class of *Alcohols*.

In the article **SYNTHESIS**, a method is described by which Berthelot artificially formed alcohol from inorganic compounds. He has since devised another method, which throws much light on the nature of the composition of this substance. On combining the hydro-carbon ethylene, or olefiant gas ( $C_2H_4$ ), with hydriodic acid (HI), we obtain iodide of ethyl ( $C_2H_5I$ ); and by prolonged boiling with caustic potash, the former compound may be converted into alcohol, as is shown in the equation,\*

Here it is seen that the iodine of the iodide of ethyl abstracts the potassium from the hydrate; while the group  $C_2H_5$ , which constitutes ethyl, is substituted for the metal. Alcohol may thus be regarded as a hydrate analogous to hydrate of potash; and if the latter is regarded as water in which one atom of hydrogen has been replaced by one of potassium, so alcohol may be regarded as water in which one atom of hydrogen has been replaced by the monatomic radical ethyl. Hence, while alcohol was regarded, according to the compound radical theory, as hydrated oxide of ethyl,  $C_2H_5O.HO$ , it is now regarded, according to the old theory of types (q.v.), as water in which one atom of hydrogen is replaced by one of ethyl,  $C_2H_5$ , and is expressed by the formula

The action of oxygen on alcohol requires a brief notice. In a nearly anhydrous state, alcohol has little tendency to oxidation, but when freely diluted and exposed to the air, it rapidly becomes oxidized into acetic acid, a result shown by the equation,

This conversion is, however, not a direct one, an intermediate compound, termed aldehyde (q.v.), being first formed, which is rapidly oxidized into acetic acid. The oxidation of alcohol into aldehyde is represented by the equation,

\* We have expressed the substances in the following equation in accordance with the theory of types, because the substitution of the ethyl for the potassium is thus more clearly seen than in the corresponding equation,  $C_2H_5I + 2KO = C_2H_5O_2 + KI$ .

while the further oxidation of aldehyde into acetic acid is represented by

Chlorine and alcohol react singularly on each other—the final products being hydrochloric acid, and a very remarkable colorless oily fluid of a peculiar penetrating and irritating odor, called chloral, which is represented by the formula,  $\text{C}_2\text{H}_5\text{ClO}_2$ . Dilute alcohol distilled with chloride of lime (bleaching-powder) yields chloroform; and this is the most economical process for obtaining this invaluable compound. Heated with an excess of sulphuric acid, alcohol loses all its oxygen in the form of water, and is converted into ethylene, the result being shown by the equation,

A less complete dehydration, under the action of sulphuric acid, converts alcohol into ether. The process is a complicated one, but the final result is expressed by the equation,

The best tests for discovering the presence of alcohol are—1. Its hot, pungent taste, its odor, and its great volatility. 2. Absorbed in asbestos, it burns with a pale blue flame, which deposits no carbon on white porcelain; and when burned in the mouth of an inverted test-tube, containing a few drops of the solution of baryta, it produces a well-marked deposit of carbonate of baryta—carbonic acid and water being the products of its combustion. 3. It dissolves camphor. 4. It sets free green oxide of chromium when boiled with a few drops of a saturated solution of bichromate of potash, mixed with sulphuric acid. The chromium test, originally discovered by Dr. Thomson in 1846, is that on which the French physiologists Lallemand, Perrin, and Duroy relied in their investigations regarding the presence of alcohol in the blood, urine, expired air, etc. See ALCOHOL, PHYSIOLOGICAL ACTION OF.

Alcohol is of a double use to the chemist, inasmuch as it furnishes a cleanly and valuable fuel when used in the spirit-lamp, and possesses remarkable solvent powers without in general exerting chemical action on the dissolved substances. It dissolves many of the gases more freely than water, as, for example, nitrous oxide, carbonic acid, phosphuretted hydrogen, cyanogen, and the hydrocarbons, as, for instance, ethylene. Amongst the mineral substances which it dissolves may be mentioned iodine, bromine, boracic acid, the hydrates of potash and soda, the chlorides of calcium, strontium, magnesium, zinc, platinum, and gold, the perchloride of iron, corrosive sublimate, the nitrates of lime, magnesia, etc.; whilst among organic matters, it dissolves many organic acids, bases, and neutral bodies, the resins, the soaps, and the fats, which latter, however, dissolve more freely in ether than in alcohol. The alcoholic solutions of substances used in medicine are called *Tinctures*.

In the article POLYATOMIC ALCOHOLS (q.v.), the general characteristics of the class of bodies now known as alcohols are briefly given. The term *alcohol* is now so far extended as to include all neutral compounds of carbon, hydrogen, and oxygen, which react upon acids in such a way that water is eliminated while ethers are produced. We shall endeavor to elucidate the nature of the different classes of alcohols by giving one example of each principal kind. In a *monatomic alcohol* (see POLYATOMIC ALCOHOLS), half the hydrogen in the primary type for water,  $\begin{smallmatrix} \text{H} \\ | \\ \text{H} \end{smallmatrix} \text{O}_2$ , is replaced by an organic radical; thus in methyl-alcohol, or wood-spirit, one equivalent of hydrogen, H, is replaced by one equivalent of the organic radical methyl,  $\text{C}_2\text{H}_5$ —the formula for methyl-alcohol being  $\begin{smallmatrix} \text{C}_2\text{H}_5 \\ | \\ \text{H} \end{smallmatrix} \text{O}_2$ , or  $\text{C}_2\text{H}_6\text{O}_2$ ; while in ordinary vinic or ethyl-alcohol there is a similar replacement by the radical ethyl,  $\text{C}_4\text{H}_9$ —the formula for this (the ordinary) alcohol being  $\begin{smallmatrix} \text{C}_4\text{H}_9 \\ | \\ \text{H} \end{smallmatrix} \text{O}_2$ , or  $\text{C}_4\text{H}_{10}\text{O}_2$ .

The *monatomic alcohols* are more abundant than all the *polyatomic alcohols* together. There are several series of them, of which the most important are alcohols whose radical is of the form  $\text{C}_n\text{H}_{2n+1}$  (as  $\text{C}_2\text{H}_5$ ,  $\text{C}_4\text{H}_9$ ,  $\text{C}_6\text{H}_{13}$ ), and which are represented by the formula  $\begin{smallmatrix} \text{C}_n\text{H}_{2n+1} \\ | \\ \text{H} \end{smallmatrix} \text{O}_2$ , or  $\text{C}_n\text{H}_{2n+2}\text{O}_2$ . Of these, twelve are at present known. They are intimately related to the fatty acids, whose general formula is  $\text{C}_n\text{H}_{2n}\text{O}_4$ , which may be formed from the alcohol by oxidation— $\text{O}_2$  being substituted for  $\text{H}_2$ . Thus alcohol, represented generally by  $\begin{smallmatrix} \text{C}_n\text{H}_{2n+1} \\ | \\ \text{H} \end{smallmatrix} \text{O}_2$ , yields the fatty acid represented by  $\text{C}_n\text{H}_{2n}\text{O}_4$ ; for example, methyl-alcohol,  $\text{C}_2\text{H}_5\text{O}_2$ , yields formic acid,  $\text{C}_2\text{H}_4\text{O}_4$ ; ethyl-alcohol,  $\text{C}_4\text{H}_9\text{O}_2$ , yields acetic acid,  $\text{C}_4\text{H}_8\text{O}_4$ , and so on. The three highest alcohols of this set, whose formulae are  $\text{C}_{27}\text{H}_{54}\text{O}_2$ ,  $\text{C}_{31}\text{H}_{62}\text{O}_2$ , and  $\text{C}_{33}\text{H}_{68}\text{O}_2$ , known as cetyllic, cerotyllic, and melissyllic alcohols, are solid waxy or fatty matters. There is one alcohol whose radical is  $\text{C}_{10}\text{H}_{17}$ , and whose formula is  $\text{C}_{10}\text{H}_{18}\text{O}_2$ —viz., the solid substance known as Borneo camphor

(see RESINS); and in cholesterin (an ingredient of the bile), whose formula is  $C_{26}H_{44}O$ , the radical is  $C_{25}H_{43}$ . *Diatomic alcohols* belong to the secondary water type,  $\begin{smallmatrix} H_2 \\ H_2 \end{smallmatrix} \left\{ O_1 \right.$ , in which, as before, half the hydrogen,  $H_2$  (which, in this case, is two atoms), is replaced by one atom of a compound radical. The radical is often marked with two dashes in such cases as these, to indicate that one of its atoms replaces two of hydrogen. Thus, the most important diatomic alcohol, glycol, is represented, according to the theory of types, by the formula  $\begin{smallmatrix} (C_2H_4)'' \\ H_2 \end{smallmatrix} \left\{ O_1 \right.$ , its radical being  $C_2H_4$ . In the *triatomic alcohols*, we take  $\begin{smallmatrix} H_3 \\ H_3 \end{smallmatrix} \left\{ O_2 \right.$ , or the tertiary type of water, and replace half the hydrogen—viz., three atoms, by one atom of an organic radical, which we consequently mark with three dashes. The well-known substance glycerine is the only example of the triatomic alcohols. Its radical is  $C_3H_5$ ; and as this replaces three atoms of hydrogen, its typical formula is  $\begin{smallmatrix} (C_3H_5)''' \\ H_3 \end{smallmatrix} \left\{ O_2 \right.$ ; its ordinary formula being  $C_3H_8O_3$ , which throws no light on its internal constitution. One *tetratomic* and one *hexatomic* alcohol have been discovered.\* The former is erythrite, a substance obtained from the litmus lichen; one atom of its radical,  $C_4H_6$ , replaces four atoms of hydrogen, and its typical formula is written  $\begin{smallmatrix} (C_4H_6)'''' \\ H_4 \end{smallmatrix} \left\{ O_3 \right.$ ; while the latter is mannite (the chief ingredient of the well-known substance maana, described in the article SUGAR), in which one atom of the radical,  $C_{12}H_{18}$ , replaces six atoms of hydrogen, its typical formula being  $\begin{smallmatrix} (C_{12}H_{18})^{vi} \\ H_6 \end{smallmatrix} \left\{ O_{12} \right.$ , while its ordinary formula is  $C_{12}H_{24}O_{12}$ .

We have entered somewhat fully into the consideration of this somewhat difficult subject, because it is one of great general interest, as showing the close chemical connection between various groups of bodies of apparently totally different natures. No one could have anticipated, twenty years ago, that such very different substances as cholesterin and mannite were allied to ordinary alcohol.†

ALCONA, a co. in n. e. Michigan, on lake Huron; 630 sq. m.; pop. '74, 1214; drained by the Ausable and branches. It was but recently organized.

ALCORA, a town of Valencia, Spain, in the province of Castellon, 43 m. n.n.e. from Valencia. It is tolerably well built. Many of the inhabitants are employed in the manufacture of earthenware and the distilling of brandy. Corn, grapes, silk, and hemp are among the principal productions of the neighborhood. Fruits are a chief article of export. Pop. 5609.

ALCORAN. See KORAN.

ALCORN, a co. in n.e. Mississippi, on the Tennessee border; 460 sq. m.; pop. '70, 10,421—2768 colored. The surface is level, and soil fertile. Co. seat, Corinth.

ALCOTT, AMOS BRONSON, b. Connecticut, 1799. He was the son of a farmer, and when young, went to Virginia as a peddler. Returning to New England, he became a successful teacher of children in Boston, remarkable for sympathy and skill in dealing with the very young; but he gave up his school, and at Concord, Mass., began the study of natural theology, civil and social science, and reforms, especially in education and diet. He visited England in 1842, and brought back with him Charles Lane and H. G. Wright, and the three founded a community, near Harvard, Mass. The Englishmen soon went home, the community farm was sold, and A. went to Concord, where he has since lived as a peripatetic philosopher, speaking occasionally to the public in other places, when invited, on a wide range of subjects, from divinity to practical cookery. He is admired for brilliancy and suggestiveness. His points of importance in treating of man physically are: race, complexion, diet, and government. He has written *Orphic Sayings*, *Tablets*, *Concord Days*, etc. In his theology he has always cultivated the mystical element, and of late years his teachings show a decided tendency towards the evangelical view of Christianity, though he declines to attach himself to any sect.

ALCOTT, LOUISA MAY, b. 1833; daughter of A. Bronson; when very young a writer of fairy tales, and later of *Hospital Sketches*, for which the materials were secured while she was a nurse in the army, during the war of the rebellion. *Little Women*, *Little Men*, and *An Old Fashioned Girl*, are among her popular works.

ALCOTT, WILLIAM ALEXANDER, 1798-1859; b. Connecticut; cousin of A. Bronson, an American author. When young he worked on a farm in summer and taught school in winter. He studied medicine at Yale, and assisted Woodbridge in preparing his geog-

\* A second tetratomic alcohol, propylphveite,  $C_6H_8O_8$ , has been lately artificially formed by Carius; and dulcite, which is isomeric with mannite, is now regarded as a second hexatomic alcohol. We mention these facts to show what constant additions are being made to this class of bodies.

† There can be no doubt that the sugars will soon be universally admitted to be alcohols, as Berthelot suggested a few years ago. In one of our best and latest works on chemistry, Naquet's *Principes de Chimie, fondée sur les Théories Modernes* (2d ed., 1867), cane-sugar, melitose, trehalose, mycose, mélézitose, lactose, and parasaccharose (most of which are described in the article SUGAR, q. v.) are placed under the head of "Alcohols Polyglucosides."

raphies, at the same period editing the *Juvenile Rambler*, the first serial for children issued in America. He also edited *Annals of Education*, and worked with Gallaudet, Hooker, and others for school reform, gaining a premium for a paper *On the Construction of School Houses*. In 1832, he removed to Boston and published *The Young Man's Guide*. Within 20 years of lecturing he visited more than 20,000 schools, making addresses to most of them. His works are more than a hundred in number, nearly all of a reformatory character.

**ALCOVE** (Spanish *alcoba*, which is derived from the Arabic *el-kauf*, a tent), an architectural term, denoting a sort of niche or recess in a chamber where one may recline, or where a bed may be placed. An A. is either hung with curtains or closed with doors during the day. It was known to the ancients, and at one time very common in France, when the immoderate size of the apartments rendered it absolutely necessary as a preventive against the cold during sleep. It is no longer fashionable, the most eminent physicians having declared it to be prejudicial to health.

**ALCOY**, a t. of Spain, in the province of Alicante, a portion of the former kingdom of Valencia. It is "built in a funnel of the hills, on a tongue of land hemmed in by two streams, with bridges and arched viaducts." The houses hang picturesquely over the terraced gardens and ravines. The walls of A. are of clay, and suffered considerable damage during the last war; but the town contains some new edifices, and has numerous manufactories. "Here is made the *papel de hilo*, the book *Librito de fumar*, which forms the entire demiduodecimo library of nine tenths of Spaniards, and with which they make their *papelitos*, or little paper cigars?" 200,000 reams are annually made, of which 10,000 are used for writing, 10,000 for packing, and 180,000 for the paper cigars! A. is also famous for its sugar-plums. It has a consistory, town-hall, poor asylum, public granary, etc. Pop. about 25,000.

**ALCUDIA, MANUEL DE GODOY, DUKE OF**, known as the prince of peace, was b. at Badajoz, in Spain, 12th of May, 1767. Poor, but handsome and musical, at the age of twenty he entered the king's body-guard at Madrid, and soon became a favorite of the weak Charles IV., as well as of his queen. Honors and emoluments flowed in rapidly. In 1801, he led the Spanish army against the Portuguese, and signed the treaty of Badajoz. In 1804, he was made generalissimo of the Spanish forces on sea and land, and invested with unlimited power. The alliance of Spain with France, and the war with England which ensued, in spite of the sums paid by Spain to secure neutrality, the defeat of Trafalgar, and consequent check to commerce—all tended to exasperate the public mind, and a court-party was formed against him, with the prince of Asturias at its head. A. now resolved to shake off the French alliance, and to treat secretly with the Lisbon court. But however cautiously taken, his warlike measures reached the ears of Napoleon, and determined him to carry out his project of dethroning the Bourbons. Meanwhile, the people had been further exasperated against the favorite by his unprincipled accusations against the prince of Asturias; and when, in 1808, Charles abdicated in favor of his son, the duke's life was only saved by the promise of his trial. This trial, however, never took place. Napoleon, who knew his influence over the minds of their Spanish majesties, had him liberated, and brought to Bayonne, where he instigated all measures taken by the ex-king and queen, retaining their favor till their death. After his fall, he lived chiefly in France. In 1808, his income had been estimated at five million piastres. After the revolution of 1830, we find him subsisting in Paris upon a small pension bestowed by Louis Philippe. In 1847, his return to Spain was permitted, and his titles, together with great part of his wealth, restored. He died at Paris, 4th Oct., 1851.

**ALCUIN, or FLACCUS ALBINUS**, the most distinguished scholar of the 8th c., the confidant and adviser of Charlemagne, was b. at York about the year 735. He was educated under the care of archbishop Egbert, and his relative, Aelbert, and succeeded the latter as master of the school of York. Charlemagne became acquainted with him at Parma, as he was returning from Rome, whither he had gone to bring home the *pallium* for a friend; and in the year 782, this monarch invited him to his court, and availed himself of his assistance in his endeavors to civilize his subjects. A. became the preceptor of Charlemagne himself, whom he instructed in the various sciences. To render his instructions more available, Charlemagne established at his court a school called *Schola Palatina*, the superintendence of which, as well as of several monasteries, was committed to him. In the learned society of the court A. went by the name of Flaccus Albinus. Most of the schools in France were either founded or improved by him. Among others, he founded the school in the abbey of St. Martin, in Tours, 796, taking as his model the school of York, and in this school he himself taught after his retirement from court, 801. While living at Tours, he frequently corresponded with Charlemagne. At his death, in 804, he left, besides numerous theological writings, a number of elementary works on philosophy, mathematics, rhetoric, and philology; also poems, and a great number of letters. His letters, while they betray the uncultivated character of the age generally, show A. to have been the most accomplished man of his time. He understood Latin, Greek, and Hebrew. Good editions of his works appeared in 1777 and in 1873. See the life of A. by Lorenz, 1829; Monnier's *A. et Charlemagne*, 1864; and Mullinger's *Schools of Charles the Great*, 1877.

ALCY'ONE, the most brilliant of the seven stars or pleiades, and supposed by Maedler to be the central sun in reference to which our sun with its planets and all other known systems are moving, or perhaps revolving within some almost incomprehensible period of time. Argelander has shown that this cannot be true.

ALCY'ONE, or HALCYONE, in classic legend, daughter of Æolus, and wife of Ceyx, so inconsolable on the death of her husband that she threw herself into the sea, whereupon she and her husband were changed into kingfishers as a reward of their mutual devotion.

ALCYONIUM, a genus of zoophytes, the type of a family called *alcyonide*, belonging to the class *anthozoi*, and other *asteroida*, and consisting of a polype-mass with starlike pores and protrusive polypes. *A. digitatum* is extremely common on the British shores, on stones, old shells, etc., in deep water. It sometimes appears as a mere crust, about the eighth of an inch in thickness, but commonly rises up in rounded cones, and often assumes forms which have procured for it the popular name of *dead man's fingers*, and other similar appellations. The polype-mass is gelatinous within, and covered with a sort of leathery skin, the mass being traversed by a multitude of minute canals, terminating on the outer surface in starlike figures, which, if the whole is placed in sea-water, are seen to project considerably from the surface, and appear as polypes with eight tentacula or feelers; so that what seems to be a disgusting fleshy mass in the fisherman's net, proves to be, when placed in its proper element, a structure of wonderful beauty and full of animal life, existing under peculiar and wonderful conditions. The manner in which the polypes protrude and retract themselves has been likened to that in which the horns of a snail are protruded and retracted. Their tentacula are short, obtuse, and elegantly fringed at the margins. The external part of the body of the polype is a membrane so transparent, that by the employment of a magnifying glass the whole internal structure can be seen through it. This delicate membrane, however, is composed of two very thin membranes, intimately united, the outer of which increases in thickness at the base of the polype, coalesces with that of adjacent polypes, and is continuous with the common leathery skin of the polype-mass. The inner membrane retains its extreme delicacy throughout; it extends into and lines the cell of the polype and the tube or canal which proceeds from the cell into the mass, and is thus also continuous with the corresponding membranes of other polypes; for the canals divide into branches in their course from the base of the polype-mass to the surface, and the intimacy of union in the whole is increased by a fine tubular net-work which occupies the spaces between the principal canals. If a portion of an *A.* is irritated, not only the particular polypes immediately subjected to irritation retract themselves as to withdraw from danger, but the gradual collapse and contraction of the whole polype-mass shows that the irritation has been felt through it all. The contraction of the mass is owing to a discharge of water, which the polypes, when protruded, imbibed, and which circulates through and distends the polype-mass, so that when the polypes are undisturbed, and in full activity, it has twice or three times the size which it has as we find it cast out upon the beach. The stomach of each polype is cylindrical and beneath it is a comparatively large cavity, into which hang loosely eight twisted filaments or threads, the use of which is not well ascertained, and has been the subject of very different opinions among naturalists. In the gelatinous substance of the polype-mass, which fills the interstices of the tubular net-work, numerous crystalline calcareous spicula lie immersed, like the *raphiides* (q.v.) found in the intercellular passages of some plants. They are toothed on the sides, but are of various forms, and have no organic connection with any part of the animal structure; their only use apparently being to impart some degree of strength to the whole. These spicula are of general occurrence in zoophytes of this order, and are secreted by the common skin of the polype-mass. The polype-mass increases by *gemmae* or buds, which grow into new branches; but the propagation of the species takes place by *ova* or eggs, which first appear as minute smooth warts on the membrane of the canals in the interior. The constriction of the neck, by which they grow, separates them from the parent membrane, and they move through the canal by means of very minute vibrating cilia or hairs with which they are furnished, until they reach the stomach of a polype, into which they enter, and through which they more slowly proceed till at last they are ejected by the mouth (the only opening), and committed to the waves and tides. The ova seem as if capable of feeling whilst within the parent mass, and may be observed to move backwards and forwards, and to contract their sides as if by voluntary action in their passage through the body of the polype. These wonderful phenomena of nature are the more easily observed because the ova are of a deep vermilion color, beautifully contrasting with the pure white of the polype, through the tunic of which they are seen.—One of the most remarkable known species of *A.*, and the largest, is that called *A. poculum* or Neptune's cup, which was discovered by Sir Stamford Raffles upon the coral-reefs of Sumatra, and is found in the neighborhood of Singapore. It grows erect, sometimes attaining nearly 3 ft. in height and 18 in. in diameter. Specimens are now frequent in museums in this country.

The name alcyonium was formerly also given to many zoophytes now found to be of very different structure, some of which now bear the name *alcyonidium*, others that of

*aleyonella*. The genus *aleyonidium* belongs to the class of zoophytes called *polyzoa*, order *infundibulata*. See ZOOPHYTES. The most common British species is *aleyonidium gelatinosum*. It resembles a sponge in appearance, but is more pellucid and gelatinous, and is full of polypes, each having 15 or 16 long slender tentacula. It is attached to old shells and stones, and is sometimes much lobed, as in the preceding figure, sometimes almost simple. The color varies from a very pale brown to clear yellow; the surface is speckled with minute dots, from which, when it is placed in sea-water, the polypes protrude. The polype differs widely from that of *aleyonium* in having an intestine, which, proceeding from the stomach to the aperture of the cell, opens there by an orifice distinct from the mouth, a difference characteristic of the classes to which they respectively belong. The ova are clothed with cilia, and their motions either are or most strikingly resemble voluntary motions.—*aleyonella* belongs to the class *polyzoa*, order *hypocrepia*. See ZOOPHYTES. There is one British species, *aleyonella stagnorum*, found in stagnant waters, especially in autumn, in shapeless, jelly-like masses, of a blackish-green color, usually adhering to the leaves of aquatic plants. The jelly-like mass is traversed from base to surface by multitudes of tubes, which open by a roundish or 5-angled aperture; the heads of the polypes project a little way from the aperture, and expand into a circle of about fifty tentacula. About 1600 polypes are situated on a square inch of the surface of the mass. The number of tentacula on a specimen of moderate size has been computed at more than 5,000,000. The tentacula are covered with minute cilia, only to be observed with a high magnifying power, by means of which a constant whirlpool is maintained, centering in the mouth of the polype, and essential, probably, for breathing as well as for the supply of food. Each polype is organically connected with the mass, its tunic being continuous with the tube. The alimentary canal has two openings. The ova are to be found in vast numbers in the tubes which traverse the mass. They are dark brown, whilst the tubes are colorless or tinted with green, of a lens-like form and destitute of cilia. They are produced from all parts of the inner side of the gelatinous tubes; and as there seems to be no aperture for their escape, it is supposed that they are liberated from the parent mass only on its death and decomposition. The *aleyonella* is an interesting object in a fresh-water aquarium, but is rather difficult to preserve. It is not, however, always to be found even in ponds where it might be expected, and is abundant in particular seasons and rare in others. The ova are probably capable of remaining long dormant, until some concurrence of circumstances favors the development of the germ of life which they contain. See Johnson's *History of British Zoophytes*, 2 vols., Lond. 1847—a most interesting and valuable work.

**ALDAN**, a river of Siberia, in the government of Yakutsk; rises in 55° n. and 125° e. It flows 300 m. n.e., turns n.w. and joins the Lena 400 m. below Yakutsk. Its length is unknown, but it is probably between 900 and 1300 m.; it is in part navigable.

**ALDAN MOUNTAINS**, a branch of the Stanavoi mountains running from the main chain in the direction of Aldan river. Some think the name ought to be given to the whole mountain system of eastern Siberia.

**ALDBOROUGH**, a t. in England, 16 m. n.n.w. of York. A. formerly had two members of parliament, but was disfranchised by the reform act of 1832. The t. is remarkable for ancient ruins. It was the Isurium of the Romans, and remains of aqueducts, buildings, tessellated pavements, implements, urns, and coins have been found. Pop. 71, parish, 3165; town, 502.

**ALDEBARAN**, the Arabic name of a star of the first magnitude, in the constellation Taurus. It is the largest and most brilliant of a cluster of five which the Greeks called the Hyades. From its position it is sometimes termed "the bull's eye."

**ALDEGONDE**, SAINT, PHILIP VAN MARNIX, baron of, 1538-98; a Dutch statesman, educated at Geneva, a strong Calvinist and a leader among the nobles who protested against the establishment of the inquisition in the Netherlands in 1566. He was the friend of William of Orange, who gave him several important missions, and sent him in 1572 to the first Dutch states-general at Dort. He was envoy to Paris, to London, and to the diet of Worms. As burgomaster of Antwerp in 1584 he defended that city against the duke of Parma, and in 1590 he was again ambassador to France. He left a metrical version of the Psalms, and at his death was translating the Bible into Flemish.

**ALDEGREVER**, or **ALDEGRAF**, HEINRICH, 1502-62; a German painter and engraver. From his style, which closely resembles his master's, he has been called the "Albert Durer of Westphalia." His engravings put him in the first rank of "little masters." Specimens of his paintings are very rare.

**ALDEHYDE** ( $C_2H_4O_2$ ) is a volatile fluid produced by the oxidation and destructive distillation of alcohol and other organic compounds. Its discoverer, Döbereiner, called it *light oxygen ether*; its present term is an abbreviation of *alcohol dehydrogenitum*, its composition being represented by that of alcohol from which two atoms of hydrogen have been abstracted. In the article on this subject in Watt's *Dictionary of Chemistry*, ten different modes of obtaining this substance are given. It is sufficient here to state that the best modes of preparing it may be found in that work, or any recent treatise on organic chemistry. It is a thin, transparent, colorless liquid, very inflammable, burning with a blue flame, and having a spec. gr. of 0.8, a boiling-point of about 71°, and a

pungent, suffocating odor. It mixes in all proportions with water, alcohol, and ether, and dissolves sulphur, phosphorus, and iodine. As is shown in the article ALCOHOLS, it constitutes an intermediate stage in the oxidation of alcohol into acetic acid. A. must be regarded as a monobasic acid, inasmuch as it contains one atom of hydrogen replaceable by a metal. Thus, when potassium is gently heated with A., one atom of H is replaced by one of K, the resulting compound being aldehydate of potash,  $C_nH_{2n}KO_2$ . Various salts of this kind may be formed, of which the most important is aldehydate of ammonia, or aldehyde-ammonia,  $C_nH_{2n}(NH_4)_2O_2$ , which is obtained in transparent shining crystals, and is a compound that has led chemists to the discovery of a large number of very remarkable derivatives.

ALDEHYDES are a class of organic compounds, intermediate between alcohols and acids; the ordinary aldehyde, described in the preceding article, being, as we have seen, intermediate between ordinary alcohol and its corresponding acid—viz., acetic acid. It has been shown in the article ALCOHOLS that the compounds of this class related to the fatty acids are represented by the general formula,  $C_nH_{2n+2}O_2$ , while the corresponding acids have the formula,  $C_nH_{2n}O_4$ . Each aldehyde is derived from the corresponding alcohol by the abstraction of two atoms of hydrogen, and each aldehyde is converted into its corresponding acid by the addition of two atoms of oxygen. These essential facts are shown in the equation,

Nine A. of the form  $C_nH_{2n}O_2$ , corresponding to  $n = 2, 3, 4, 5, 7, 8, 11, 12$ , and 16, are at present known, the simplest being ordinary or acetic acid,  $C_2H_4O_2$ , and the highest being palmitic aldehyde,  $C_{16}H_{32}O_2$ . It is obvious that, as far as is yet known, there is not of necessity always an aldehyde intervening between the alcohol and corresponding acid; for example, methylic and caprylic alcohols have not yet yielded an aldehyde.

Amongst A. not connected with the preceding group may be mentioned various organic compounds which have been recently shown to belong to this class—thus, acrolein,  $C_3H_4O_2$ , is acrylic aldehyde; camphor,  $C_{10}H_{16}O_4$ , is campholic aldehyde; bitter-almond oil,  $C_{11}H_{12}O_2$ , is benzoic aldehyde; oil of cumin,  $C_{10}H_{12}O_2$ , is cuminic aldehyde; oil of cinnamon,  $C_{15}H_{16}O_2$ , is cinnamic aldehyde; salicylic acid,  $C_{11}H_{10}O_4$ , is salicylic aldehyde; and anisylous acid,  $C_{15}H_{14}O_4$ , is anisyl aldehyde. Most of these A. are obtained directly from plants, and either exist in them ready formed, or are given off as volatile oils on distillation with water.

For the best account of the aldehydes with which we are acquainted, we must refer to the chapter on that subject in the second edition (1837) of Naquet's *Principes de Chimie, fondée sur les Théories Modernes*, vol. ii. pp. 384–405, in which will be found a full account of the aldehydes derived from the monatomic alcohols, of the modes of preparing them, of the properties common to all aldehydes, and those specially belonging to different series, the rational formulae and constitution of aldehydes, and the aldehydes derived from diatomic alcohols or glycols, in which this chemist includes not only salicylous, salicylic, and glycolic aldehydes, but that remarkable synthetic product, furfurol (q.v.).

ALDEN, JAMES, a rear-admiral in the U. S. navy; b. Maine, 1809, d. San Francisco, 1877. He entered the navy as midshipman, 1823; in 1841, was made lieutenant, captain in 1863, commodore in 1866, and retired with rank of rear-admiral in 1873. He was in the Wilkes exploring expedition, and in the naval operations of the Mexican war; and 1848 to 1860 in the coast survey. In the rebellion he commanded the steamer *South Carolina*, and in 1862 the sloop-of-war *Richmond*. He was engaged in the capture of New Orleans, and the attacks of Vicksburg and Port Hudson; commanded the sloop *Brooklyn*, the leading ship of the fleet, in 1864, and was in the Mobile bay and Fort Fisher conflicts. In 1868, he was commandant of the California navy yard; in 1869, chief of the bureau of navigation in the navy department; and in 1871 he took command of the European squadron.

ALDEN, JOHN, b. England, 1599, d. Duxbury, Mass., Sept. 12, 1687; one of the pilgrims to Plymouth, Mass. He was one of the signers of the compact in the cabin of the "*Mayflower*." A. married Priscilla Mullens, to whom his first proposal was in behalf of Miles Standish, but who indicated her preference for A. over the soldier. A poem by Longfellow has this incident for its theme. He was a magistrate for more than 50 years, and greatly assisted in the government of the infant colony.

ALDEN, JOSEPH, D.D., LL.D., b. New York, 1807; graduated at Union college, 1829; studied theology at Princeton, and was ordained pastor of a congregational church in Massachusetts, 1834. He was professor in Williams college, 1835–52; in Lafayette college, 1852–57; president of Jefferson college, 1857–67, and subsequently principal of the New York state normal school at Albany.

ALDEN, NOAH, an advocate of religious liberty in Massachusetts, as against the old union of church and state, and a member of the convention that ratified the federal constitution. For 30 years, beginning 1766, he was pastor of the Baptist church in Bellingham, and he represented that t. in the state constitutional convention.

ALDEN, TIMOTHY, D.D., 1771-1839; b. Massachusetts; graduated at Harvard; pastor of a congregational church in Portsmouth, 1799-1805, and a prominent teacher there, and in Newark, Boston, New York, and Cincinnati. He was the founder and first president of Allegheny college, Meadville, Pa., and author of *Missions Among the Senecas*, a book of epithaphs, and other works.

ALDENHOVEN, a t. in Rheinish Prussia, n.e. of Aix-la-Chapelle; pop. '67, 3041. A. is noted as the place of a victory by the Austrians over the French, under Dumouriez, Mar. 1, 1793.

ALDER (*Alnus*), a genus of plants of the natural order *betulaceæ* (regarded by many as a sub-order of *amentaceæ*. See BIRCH and AMENTACEÆ. The genus consists entirely of trees and shrubs, natives of cold and temperate climates; the flowers in terminal, imbricated catkins, which appear before the leaves; the male and female flowers in separate catkins on the same plant; the male or barren catkins loose, cylindrical, pendulous, having the scales 3-lobed, and each with three flowers whose perianth is single and 4-partite; the fertile catkins oval, compact, having the scales sub-trifid, and each with two flowers destitute of perianth; styles, two; fruit, a compressed nut without wings.—The COMMON or BLACK A. (*A. glutinosa*) is a native of Britain, and of the northern parts of Asia and America. It has roundish, wedge-shaped obtuse leaves, lobed at the margin and serrated. The bark, except in very young trees, is nearly black. It succeeds best in moist soils, and helps to secure swampy river-banks against the effects of floods. It attains a height of 30 to 60 ft. Its leaves are somewhat glutinous. The wood is of an orange-yellow color, not very good for fuel, but affording one of the best kinds of charcoal for the manufacture of gunpowder, upon which account it is often grown as coppice-wood. Great numbers of small A. trees are used in Scotland for making staves for herring-barrels. The wood is also employed by turners and joiners; but it is particularly valuable on account of its property of remaining for a long time under water without decay, and is therefore used for the piles of bridges, for pumps, sluices, pipes, cogs of mill-wheels, and similar purposes. The bark is used for tanning and for dyeing, also for staining fishermen's nets. It produces a yellow or red color, or, with copperas, a black color. The leaves and female catkins are employed in the same way by the tanners and dyers of some countries. The bark is bitter and astringent, and has been used for gargles, and also administered with success in ague. The seeds are a favorite food of greenfinches.—The A. is one of the ornaments of many of the most exquisite landscapes in Britain. The dark green of its foliage, and the still darker hue of its bark, contrast beautifully with the colors of the other trees with which it is usually associated on the banks of our rivers. In boggy grounds it is often almost the only kind of tree that appears, and in many parts of the highlands, groups of alders are scattered over the lower and moister parts of the mountain-slopes. The individual tree, viewed by itself, may be regarded as somewhat stiff and formal in appearance; but in groups or clusters it is always far otherwise.—The common A. ceases on the Swedish shore of the gulf of Bothnia, in the s. of Angermannland, and is there called the *Sea A.*, because it is only in the lowest grounds near the seat that it occurs.—The GRAY or WHITE A. (*A. incana*), a native of many parts of continental Europe, especially of the Alps, and also of North America, and of Kamtchatka, but not of Britain, differs from the common A. in having acute leaves, downy beneath, and not glutinous. It attains a rather greater height, but in very cold climates and unfavorable situations appears as a shrub. It occurs on the Alps at an elevation above that to which the common A. extends, and becomes abundant also where that species disappears in the northern part of the Scandinavian peninsula. The wood is white, fine-grained, and compact, but readily rots under water. The bark is used in dyeing.—*A. cordifolia* is a large and handsome tree, with cordate acuminate leaves, a native of the s. of Italy, but found to be quite hardy in England. Some of the American species are mere shrubs. The bark of *A. serrulata* is used in dyeing.—Several species are natives of the Himalayas.—The BERRY-BEARING A., or A. BUCKTHORN, is a totally different plant. See BUCKTHORN.

ALDERMAN, a title derived from the Anglo-Saxon *ealdorman*, compounded of *ealdor* (older) and *man*. Whether any definite and invariable functions were connected with the ancient rank of *ealdorman*, does not seem to be very clearly ascertained. The term was generally applied to persons of high and hereditary distinction, such as princes, earls, and governors. Its special signification in the titles "A. of all England" (*aldermannus totius Angliæ*) and "king's A." (*aldermannus regis*) is not distinctly indicated. There were also aldermen of counties, hundreds, cities, boroughs, and castles. In modern times, aldermen are officers invested with certain powers in the municipal corporations of England, Wales, and Ireland, either as civil magistrates, or as accessors of the chief civil magistrates in cities and towns corporate. The corresponding title in Scotland is bailie. The London court of aldermen consists of 26 aldermen, including the lord mayor, and constitutes the bench of magistrates for the city, besides having judicial and legislative authority in the corporation.

**ALDERNEY** (Fr. *Aurigny*; Lat. *Aurinio*), an island in the English channel (see CHANNEL ISLANDS), lat.  $49^{\circ} 45'$  n., long.  $2^{\circ} 13'$  w., separated from the coast of Normandy by a strait about 7 m. in breadth, called the race of Alderney. Through this channel, which is very dangerous in rough weather, the remnant of the French fleet escaped after their defeat at La Hogue in 1692. The distances between Alderney and the nearest points of Guernsey, Jersey, and Great Britain are respectively about 15, 33, and 60 m. The length of the island is about 4 m., the breadth about  $1\frac{1}{2}$ . The coast to the s.e. is bold and lofty, to the n.e. and n. it descends, forming numerous small bays, one of which, that of Crabby, affords the only anchorage in the island. A harbor of refuge and breakwater have been constructed on the n. side of the island, the extensive works connected with which have greatly increased the population; 6 m. to the w. are the caskets, a small cluster of rocks on which are three light-houses. The soil in the center of the island is highly productive; and the A. cows, a small but handsome breed, have always been celebrated. The climate is mild and healthy, and good water abounds. The population has been steadily on the decrease for some time. In 1851, it was 3333; in 1871, it counted 2738. Education to some extent is universal. The population was originally French, but half the inhabitants now speak English, and all understand it. Protestantism has prevailed here since the reformation. A. is a dependency of Guernsey, and subject to the British crown. The civil power is vested in a judge appointed by the crown, and six *jurats* chosen by the people. These, with twelve popular representatives or *douzainiers* (who do not vote), constitute the local legislature. The court of justice is composed of the judge and jurats, the royal procureur and comptroller and the registrar (*greffier*), nominated by the governor. There is a local militia, consisting of two companies of infantry and a brigade of artillery. The "town," situated in a picturesque valley near the center of the island, contains a few public buildings, among which is the old church, said to have been erected in the 12th c., and a new one in the early English style, with a tower 104 ft. high. The living is a perpetual curacy in the archdeaconry and diocese of Winchester.

**ALDERSHOTT CAMP.** When England and France declared war against Russia in 1854, in relation to Turkish affairs, the British army was known to be in an unsatisfactory state; 39 years of peace had allowed many important elements in military organization to fall into a state of inefficiency. Among others, the power of acting well together in brigades and divisions had scarcely been taught to our soldiers, who had been familiar with little more than the discipline and tactics of battalions and companies. To remedy in part these defects was the object held in view in establishing the camp at A. It was to be a permanent camp, with barracks and huts, instead of mere canvas tents; and was to be provided with all the appliances for a military school, valuable to officers as well as to privates. A dreary waste, on the confines of Surrey, Hants, and Berks, called A. heath, was purchased by the government as the locality for the new camp. The area was 7063 acres, and the purchase-price about £130,000. The spot was deemed suitable as being distant from any thickly inhabited district; as being within easy reach of three or four stations on the South-western and South-eastern railways; and as being conveniently placed for the quick transmission of troops to any part of the southern coast. The camp was ready for the reception of troops in 1855. At first, no brick structures were attempted. The soldiers were accommodated in wooden huts, each furnishing living and sleeping room for about 25 men. When the camp was inaugurated, in April of the year last named, by a review at which the queen was present, there were 18,000 troops, regulars and militia, temporarily stationed there. The huts for each regiment were grouped apart, for the better maintenance of regimental discipline. Each hut had a range of iron bedsteads on either side, capable of being doubled up; and a long table through the middle, in a line with two doors at the ends of the huts. The officers' huts, though of course superior in construction and convenience, were as simple as they could well be. The cooking was performed in huts especially set apart for that purpose, provided with efficient cooking apparatus. The wooden huts have gradually been superseded by brick barracks, at a cost of more than a quarter of a million sterling. These will be briefly described in a future article (BARRACKS), as examples of the finest barracks hitherto constructed in this country. The Basingstoke canal, running directly across the heath, has occasioned a division into north camp and south camp; but each of these is susceptible of a good deal of extension. Reviews and sham-fights are frequently held, at some of which the queen has been present, and there are various important operations carried on daily, and known to very few besides those immediately concerned. There are many square m. of plain, heath, shrub, morass, valley, and hill surrounding the camp, on which soldiers, and especially the militia regiments, are exercised in the various evolutions and strategic movements connected with the battle field and siege-works. It is no child's play; the men are often severely worked, and gain a foretaste of some of the fatigues of military life. On other days, they are exercised in various quiet duties of tents and huts, barracks and kitchens, intended to teach them many of the useful knacks in which French soldiers are acknowledged to be more skilled than the English. Different regiments, regulars as well as militia, artillery as well as cavalry and infantry, take it in turn, to experience camp-life at A. There are usually about from 10,000 to 15,000 troops at the camp, comprising infantry, cavalry, artillery, and militia. The war authorities some

years ago purchased or leased a portion of forest-land between A. and Winchester; camping arrangements of a temporary kind are made, and the troops are occasionally exercised with a tough march of a dozen miles. A thriving t. (pop. in '71, 11,615) has sprung up near the camp. An unfortunate circumstance is that the barracks have been built at the very edge of the ground belonging to the government; as a consequence, private speculators built beer-houses and haunts of dissipation close to the barracks, greatly to the demoralization of the soldiers; and it is not easy to buy up these people, owing to the rise in value of the land. Some alleviation has arisen from the operation of the contagious diseases acts of 1866 and 1869.

ALDHELM, 656-709; an English divine during the Saxon heptarchy; the first Englishman who wrote Latin poetry. He was abbot of Malmesbury, bishop of Sherborne, and afterwards of Salisbury. He is known by two works, *De Virginitate* and *De Laude Virginum*.

ALDINE EDITIONS, the name given to the works that issued from the press of Aldo Manuzio (q.v.) (Lat., Aldus Manutius) and his family in Venice, 1490-1597. Recommended by their intrinsic value, as well as by their handsome exterior, they have been highly prized by the learned and by book-collectors. Many of them are the first editions (*editiones principes*) of Greek and Roman classics; others contain corrected texts of modern classic writers, as of Petrarch, Dante, Boccaccio, etc., carefully collated with the MSS. All of them are distinguished for the remarkable correctness of the typography; the Greek works, however, being in this respect somewhat inferior to the Latin and Italian. The editions published by Aldus, the father, form an epoch in the annals of printing, as they contributed in no ordinary measure to the perfecting of types. No one had ever before used such beautiful Greek types, of which he got nine different kinds made, and of Latin as many as fourteen. It is to him, or rather to the engraver, Francesco of Bologna, that we owe the types called by the Italians *corsetti*, and known to us as italics, which he used for the first time in the 8vo edition of ancient and modern classics, commencing with Virgil, 1501. Manuzio's impressions on parchment are exceedingly beautiful; he was the first printer who introduced the custom of taking some impressions on better paper—that is, finer or stronger than the rest of the edition. The first example of his is afforded in the *Epistole Græcæ*, 1499. It would be difficult to name another who has brought so much zeal, disinterestedness, taste, and knowledge to the furtherance of literature, especially classical literature. After his death, in 1515, his business was superintended by his father-in-law, Andreas Asulanus. Paul, the son of Aldus, possessed the same enthusiasm for Latin classics that his father had for Greek. He died at Rome in 1597. The printing establishment founded by Aldo continued in active operation for 100 years, and during this time printed 908 different works. The distinguishing mark is an anchor, entwined by a dolphin, generally with the motto, *Suaviter et celsè*. Under the direction of the grandson of the founder, it lost the superiority which it had formerly maintained over all the other printing-presses in Italy. The demand which arose for editions from this office, and especially for the earlier ones, induced the printers of Lyon and Florence, about 1502, to begin the system of issuing counterfeit Aldines. The Aldo mania has considerably diminished in later times. Among the A. works which have now become very rare may be mentioned the *Horæ Beati Marci Virginis* of 1497; the *Virgil* of 1501; and the *Rhetores Græci*; not to mention the editions from 1494 to 1497, which are now extremely rare. The most complete collections known are those of the former grand duke of Tuscany, and of Renouard, the bookseller of Paris. In 1834 appeared a third edition of the monograph published by Renouard, *Annales de l'imprimerie des Aldes, ou Histoire des Trois Manuces, et de leur éditions: par A. Renouard*, Paris, 1834. Ebert has published a catalogue of all the authentic A. E. in the supplement to Vol. I. of his *Bibliographical Dictionary*.

ALDINI, GIOVANNI, 1762-1834; nephew of Galvani, and brother of count Antonio Aldini; a student of natural science. He held the chair of physics at Bologna. His chief work was in experiments to apply science to useful purposes; galvanism, gas for light-houses, and fire-proof cloth receiving most attention. He was one of the founders of the national institute of Italy; received the British royal society's gold medal; and was made knight of the iron crown, and counselor of state at Milan.

ALDOBRANDINI, a noble Florentine family, among whom were Sialvestro, 1499-1558; Ippolito (pope Clement VIII.), 1536-1605; and Francesco, created a prince by Clement. The "Aldobrandine Wedding," a famous picture, dating probably from the time of Augustus, was found in 1606 on the site of the garden of Mæcenæas.

ALDRICH, THOMAS BAILEY, b. Portsmouth, N. H., 1836. He intended to enter college, but on his father's death went into his uncle's counting-room in New York, remaining three years, frequently writing verses for the newspapers; was reader for a publishing house, then a regular writer for the *New York Evening Mirror* and an editor of the *Home Journal* and the *Saturday Press*. He has contributed to the leading magazines. His first volume of poems was *The Bells*, 1855; the next year was published his remarkably successful poem, *Babe Bell*, followed by *Daisy's Necklace*, *Course of True Love*, *Out of His Head*, and *Story of a Bad Boy*. He has been editor of *Every Saturday* since its foundation.

**ALDRIDGE, IRA**, 1810-67, the "African Roscius." There are two accounts of him, one that he was a mulatto born near Baltimore about 1810, apprenticed to a German ship-carpenter, and accompanying Edmund Kean to England as a servant; returned in 1830 or '31, and appeared on the stage in Baltimore; failed and returned to England, where he gained high reputation. The other story is that he was the son of a native of Senegal, who was brought here as a slave, became a Christian and pastor of the African church in Church st., New York; that Ira was born in that city about 1805, and intended for the ministry; that he was fond of dramatic performances, but his father disapproved, and sent him to England to be educated for the ministry; that he still preferred the drama, and made his debut at the Royal theater, London, in "Othello," and was remarkably successful. He played also "Zanga," "Orozembo," "Rolla," and other characters that were color-parts throughout England. On the continent he took high rank in Shakspeare's tragedies and kindred characters, and he had presents of crosses and medals from the emperors of Austria and Russia, and the king of Prussia. He was actual or honorary member of many of the great academies. He married an English woman, whom he left a widow in London. At the time of his death he was on his way to St. Petersburg, where he had an engagement, and expected to appear in New York in the following September.

**ALDROVANDI, ULYSSES**, one of the most distinguished naturalists of the 16th c., was born at Bologna, probably about the year 1532. He was descended from a noble family, and received an excellent education, partly in his native city and partly in Padua. Some of his religious opinions having been called in question, he traveled to Rome in 1550, to vindicate himself; and whilst there, studied Roman antiquities, and wrote a treatise on ancient statuary. At Rome, he formed the acquaintance of Rondelet. On his return home, he devoted himself to the study of botany, and having taken his degree in medicine at the university of Bologna in 1553, he was in the following year appointed to the chairs of philosophy and logic, and also to the lectureship on botany. He practiced medicine for some time in Bologna, and appears after a short time to have exchanged some of the chairs which he held in the university for that of natural history, to the study of which science he applied himself with great devotedness. He established the botanical garden at Bologna in 1567. He was much employed, during many years, in forming a museum of natural history, collecting specimens with great assiduity, and employing draughtsmen to make figures of them for the great work on natural history which he contemplated. In the pursuit of his favorite science, he traveled into different countries, but no particular record of his travels remains. Inspiring others with a zeal similar to his own, he had the pleasure of seeing his museum rapidly increase. He finally bequeathed it to the senate of Bologna, and it became the foundation of the splendid public museum of that city, where many of A.'s specimens remain to this day. He left behind him also at his death a prodigious mass of valuable manuscripts, which still remain in the public library of Bologna, a store of which proper use has never yet been made, and in which there is probably much correspondence of eminent men, interesting as showing the first steps of progress of the science of natural history, after the long dormancy of the middle ages. All his studies and collections were made subservient to his work on natural history; the first volume of which—on birds—appeared in 1599. Six volumes appeared during A.'s life; other seven were published under the direction of his colleagues and pupils after his death, which took place in 1605. It has been stated in many notices of his life, and was long commonly believed, that, by his scientific pursuits, A. reduced himself to circumstances of great poverty, and that he died in a public hospital at Bologna; but the story, although Bayle has adopted it in his dictionary, rests on no sufficient evidence, and there is reason to think that it is not true. It is difficult to procure a complete edition of the works of A., and the volume on minerals is especially rare. A. has been censured for excessive copiousness in things of little importance, and at best merely serving to illustrate his subject and render it interesting. He shows, however, great anxiety to set forth all that is known on every subject of which he treats; he writes of natural history in a way which shows that he greatly loves the science, and at the same time with a devout and reverent spirit, always beholding in the works of creation the traces of the Creator's hand.

**ALDSTONE, or ALSTON**, sometimes called **ALSTON MOOR**, a market-t. of the co. of Cumberland, England, 30 m. e.s.e. from Carlisle. The parish of A. contains extensive and very productive lead mines, formerly belonging to the earls of Derwentwater, and now to the lords commissioners of the admiralty. The t. has manufactures of worsted yarns and flannel. It is situated in a mountainous district on the declivity of a steep hill, near the confluence of the Nent and south-Tyne. The pop. is about 2500. The produce of the lead mines has fallen off considerably during the past 15 years. Pop. of parish '71, 5680.

**ALE** would seem to have been the current name in England for malt liquor in general before the introduction of hops. This took place, according to Johnston (*Chemistry of Common Life*), as late as the reign of Henry VIII., about the year 1534. As the use of hops was derived from Germany, the German name for malt liquor (*bier*), *beer*, was used at first to distinguish the hopped liquor from *ale*, the unhopped. The word *ale* had in all likelihood been introduced by the Danes and other Scandinavian settlers—for *öl*

(allied probably to *oiz*) is still the name for malt liquor in the Scandinavian tongues—and must have driven out the *beor* of the Anglo-Saxons, which that people had in common with the other Teutonic nations. As now used, ale signifies a kind of beer (q.v. and FERMENTATION), distinguished chiefly by its strength and the quantity of sugar remaining undecomposed. Strong ale is made from the best pale malt; and the fermentation is allowed to proceed slowly, and the ferment to be exhausted and separated. This, together with the large quantity of sugar still left undecomposed, enables the liquor to keep long without requiring a large amount of hops. The Scotch ales are distinguished for the smallness of the quantity of hops they contain, and for their vinous flavor. They are fermented at an unusually low temperature. The ales of Edinburgh and Prestonpans have a high reputation. Burton ale is the strongest made, containing as much as 8 per cent of alcohol; while the best brown stout has about 6 per cent, and common beer only 1 per cent. India pale ale differs chiefly in having a larger quantity of hops.

ALEANDRO, GIROLAMO (HIERONYMUS), 1480–1542, studied at Venice, and got great reputation for learning, and in 1508 went to Paris, on invitation of Louis XII., to be professor of belles-lettres and rector in the university. He was sent on missions to Rome, where Leo X. kept him as librarian of the vatican. In 1520 he was papal nuncio at the coronation of Charles V., and next year Luther's chief opponent in the diet of Worms, going to the utmost extremes to suppress the doctrines of the reformer, and becoming so violent that he lost the friendship of Erasmus. He drew up the edict against Luther, and after the diet went as nuncio to the Netherlands, where he lighted the fires of persecution—two monks of Antwerp, the first martyrs of the reformation, being burned at his instigation, at Brussels. In 1523 Clement VII. sent him to the court of Francis I., and he was taken prisoner with that monarch at the battle of Pavia (1525), and released only after paying a heavy ransom. In 1538, he was made cardinal and took the title of St. Chrysogonus. The vatican library has his letters about Luther.

A-LEE, expressed by the French *sous le vent*, or “under the wind,” is a maritime term applied to the position of the helm when so worked as to bring the head of the ship to windward.

ALEGAM'BE, PHILIPPE, 1592–1652; superior of the house of Jesuits in Rome, and secretary to their general. He wrote biographies of Jesuit martyrs and a life of Cardan.

AL'EMAN, LOUIS, b. 1390; archbishop of Arles and cardinal of St. Cecilia. He was one of the presidents of the council of Basle in 1431, and led the party for the supremacy of the councils over the pope in opposition to the claims of Eugenius IV., and on his motion the latter was deposed and Felix V. elected in his stead. Eugenius thereupon deposed Felix, and deprived A. of his ecclesiastical dignities, but these were restored by Nicholas V. in 1447—Felix having resigned on A.'s advice. In 1527, A. was canonized by pope Clement VII.

ALEMAN', MATEO, a famous Spanish novelist, was b. about the middle of the 16th c., at Seville, and d. in Mexico during the reign of Philip III. In 1604 he published a poetical biography of St. Antonius of Padua; and in 1608, while in the new world, an *Ortografía Castellana*, written during his voyage; but his great work is *Guzman de Alfarache*, a novel with a rogue for the hero, like some of the more recent English fictions. It was first published at Madrid in 1599, became immensely popular, and in half a dozen years had gone through 26 editions, consisting of not less than 50,000 copies, in Spain and other countries. Both as regards the delineation of manners and the purity of style, this masterly creation of A. ranks next to that most celebrated of all the Spanish novels of the same character—the *Lazarillo de Tormes* of Mendoza. It displays keen powers of observation, and is readily recognized as the work of a ripe and cultivated mind. Mendoza's hero has the advantage in originality, freshness, and vivacity; but Guzman exhibits a richer variety of gifts in the various characters he is compelled by circumstances to assume, such as stable-boy, beggar, thief, coxcomb, mercenary, valet, pander, merchant, etc. The manners of the author's own age are hit off with great skill and effect, a wide knowledge of human nature is manifested, and the whole narrative is interspersed with shrewd and solid reflections and moralizings. A. is considered to rank with Mendoza, Cervantes, etc., as one of the masters of the Castilian style.

ALEMAN'NI (that is, *all-men*), the name of a military confederacy of several German tribes which began to appear on the lower and middle Maine about the beginning of the 8d c. Caracalla fought with them first on the Maine in 211 A.D., but without conquering them; Alexander Severus was equally unsuccessful; but Maximinus at length succeeded against them, and drove them beyond the Rhine. After his death they again invaded Gaul, but were defeated by Posthumius, who pursued them into Germany, and fortified with ramparts and ditches the boundary of the Roman territory, called the *Agri Decumates*. The mounds near Pforung, on the Danube, the rampart extending through the principality of Hohenlohe to Jaxthausen, and the ditch with palisades on the n. side of the Maine, are remains of these works. The A., however, did not desist from their incursions, although they were repeatedly driven back. After 282, being pressed upon from the n.e. by the Burgundians, they took up permanent settlements

within the Roman boundary from Maintz to lake Constance. At last, Julian came (357) to the relief of Gaul, which had been suffering from the incursions of the A., and soon compelled eight of their chiefs to sue for peace. Their united force, in their principal battle with Julian, amounted to 35,000 men. After the 5th c., the confederated nation is spoken of as A. and Suavi or Suevi. In the course of the 4th c. they had crossed the Rhine, and extended as far w. as the Vosges, and s. to the Helvetic Alps. At length Clovis, king of the Franks, broke their power in 496, and made them subject to the Frankish dominion. The s. part of their territory was formed into a duchy, called Alemannia. The name of Swabia came afterwards to be applied to the part of the duchy lying east of the Rhine. From the A. the French have given the name of *Allemands* and *Allemagne* to Germans and Germany in general, though the inhabitants of the n. of Switzerland, with those of Alsace and part of Swabia, are the proper descendants of the Alemanni.

**ALEM'BERT**, JEAN LE ROND D', one of the most distinguished mathematicians and writers of the 18th c., was b. in Paris, Nov. 16, 1717. He was the illegitimate son of Madame de Tencin, a lady of considerable notoriety in the time of the regency, and of a M. Destouches. He was exposed by his mother on the steps of the church of St. Jean-le-Rond, and the policeman who found him committed the seemingly dying infant to the care of the wife of a poor glazier, thinking it too weak to be taken to the dépôt. The father, without publicly avowing the child, secured to him an allowance of 1200 francs a year. At the age of 12, he entered the college Mazarin, where he soon gave indication of that inclination, or rather passion for mathematical studies which distinguished him through life. On leaving college, he returned to the humble home of his kind foster-mother, where he continued to live and pursue his favorite studies for nearly 40 years, sharing with her household his small revenue. Although the good woman loved him as a son, so little did she encourage his exclusive devotion to science, that when he spoke of his discoveries or writings, she replied with a sort of pity: "You will never be anything but a philosopher; and what is a philosopher, but a fool who torments himself during his life, that people may talk about him when he is dead?" At first, his friends urged him to qualify himself for some profitable career; but after trying for a time the study of law, and then of medicine, he gave up the attempt as hopeless, and abandoned himself without reserve to his passion for science. In 1741, at the age of 23, he was admitted a member of the academy of sciences, having already attracted attention by several physico-mathematical tracts. Two years later appeared his *Treatise on Dynamics*, founded on a new and fertile principle which makes an epoch in mechanical philosophy. "This principle consists," says Condorcet, "in establishing the equality, at every instant, between the changes which the motion of the body has undergone, and the forces which have been employed to produce them;" in other words, it reduces all the laws of motion to the consideration of equilibrium. Among the more important of his other scientific works are: his *Theory of the Winds*, which gained the prize of the academy of Berlin, 1746, and which contains the first conception and use of the calculus of partial differences; a treatise on the *Precession of the Equinoxes*, 1749, giving for the first time an analytical solution of that phenomenon, as well as of the nutation of the earth's axis; *Essay on the Resistance of Fluids*, 1752; *Researches on some Important Points in the System of the Universe*, 1754 and 1756. His *Mathematical Opuscles* contain an immense number of memoirs, some on new subjects, some containing developments of his previous works.

But A. did not confine himself to physical science. Diderot (q.v.) having conceived the idea of the famous *Encyclopédie*, enlisted the services of A., who wrote the *Preliminary Discourse*, which is allowed by all to be a noble tribute to literature and philosophy—a model of lucid and eloquent exposition, and displaying an immense extent of knowledge combined with rare judgment. Besides numerous articles in the *Encyclopédie*, he published *Elements of Philosophy*, 1759; *Mélanges of Literature and Philosophy*; *The Destruction of the Jesuits*, etc. He also wrote a great many *éloges* of members of the academy of sciences, of which he was elected secretary in 1772. His literary works have been published in a collected form, new edition, by Bossange, Paris, 1821, 5 vols. 8vo. This edition contains the correspondence of A. with Voltaire and the king of Prussia. His scientific works have never been collected.

A. gave striking proof of how little he regarded riches and distinctions, or the flatteries of the great, and how genuine was his love of independence. Frederick II. of Prussia offered him the presidency of the academy of Berlin, 1752, but he declined to leave France, and only accepted a subsequent offer of a pension of 1200 fr. The king of France granted him a similar sum. In 1762, Catharine II. of Russia invited him, through her ambassador, to undertake the education of her son, with a salary of 100,000 fr.; and when he declined, she wrote him a letter with her own hand, urging that to refuse to contribute to the education of a whole nation was inconsistent with his own principles; and inviting him, if he could not reconcile himself to the breaking off of his pursuits and friendships, to bring all his friends with him, and she would provide both for them and for him everything they could desire. But A. remained steadfast. When the grand duke afterwards visited Paris, he good-humoredly reproached A. with his refusal; and to the excuse of the rigor of the climate and feeble health, the prince

replied, with the compliment: "In truth, monsieur, it is the only false calculation you have made in your life." A. was never married. He was tenderly attached for many years to a Mademoiselle Espinasse, although their intimacy, it is believed, never went beyond a warm friendship. The death of the lady was a severe blow to A. His own health began to give way; for he was suffering from the stone, and would not consent to an operation. He died Oct. 29, 1783.

A. was truthful, frank, and extremely benevolent. He held it as a principle of morals that a man has no right to dispose at will of his own superfluous means while there are others in want of the necessities of life. A stigma has attached to the name of A. from his intimate association with Voltaire and other assailants of Christianity; but A. never attacked religion in his published writings, which might be read without knowing what his opinions regarding revelation were. It is only from his private correspondence that it appears that he thought the probabilities were in favor of theism.

**ALEM'EIC** (formed by the Arabs from their article *al* and Gr. *ambix*, a goblet) is a form of still introduced into chemistry by the alchemists, and used by the more ancient experimenters in manipulative chemistry for the distillation and sublimation of substances, such as alcohol, or formic acid obtained by heating a decoction of red ants in water.

Alembic.

The vessel consisted of a *body*, *cucurbit* or *matrass* (A), in which the material to be volatilized was placed; a *head* or *capital* (B) into which the vapors rose, were cooled, and then trickled down to the lower part (C), from whence by a *pipe* (D) the distilled product passed into the *receiver* (E). Where very volatile liquids were being distilled, it was customary to introduce the receiver (E) into a vessel with cold water, so as to increase the perfectness of the condensing part of the arrangement. The A. has now been entirely superseded by the retort and receiver, or by the flask attached to a Liebig's condenser. See **RETORT**.

**ALEMTE'JO**, a province in the s. of Portugal; area, 9388 sq.m.; pop. '74, 375,996. It is partly washed by the Atlantic on the w., and stretches to the Spanish frontier on the e. It is traversed by a number of mountain-chains, and is watered by the Tagus, Guadiana, and Sado or Sado. In the s. and w., the climate is hot and dry; the plains are covered with brown heath, unrelieved by a tree or a shrub, and only broken at intervals by marshy wastes, while the vegetation is extremely scanty. In the e., on the contrary, the valleys are fertile, and the mountains adorned with forests. The productions are singularly abundant. They consist of wheat, barley, rice, maize, the vine, and a variety of choice fruits—such as the citron, the lemon, the fig, the pomegranate. In the valleys, the principal trees are the oak with edible fruits, the evergreen oak, the cork-oak, the chestnut, and the pine; in the plains, we find lavender, rosemary, juniper, the myrtle. The pasturage, also, is extraordinarily fine. Great attention is paid to the rearing of swine, goats, and sheep, and, in a less degree, of horned cattle, asses, and mules. As the population is sparse, more grain is produced than is consumed; but manufactures are in a backward condition. Even mining, which might be very profitably carried on, is neglected. The chief towns are Evora (the capital), Elvas, Portalegre, Beja, Estremoz, and Mertola.

**ALEN'CON**, chief t. of the department of Orne, in France, is situated on the Sarthe, in lat. 48° 25' n., and long. 0° 54' e. The town-church—a structure of the 16th c., containing the remains of the tombs of the A. family, which were almost completely destroyed at the revolution—is built in the Gothic style. It has a fine porch and exquisitely painted windows. A. is a clean and handsome t., with good streets and a delightful public walk. The inhabitants produce excellent woolen and linen stuffs, embroidered fabrics, straw-hats, lace-work, artificial flowers, hosiery, etc. The manufacture of A. point-lace (*points d'A.*), although still important, is not carried on to the same extent as formerly. The cutting of the so-called A. diamonds (quartz-crystals), found in the vicinity of the t., is a branch of industry which has also greatly declined. Pop. '76, 15,433.

The old Dukes of A. were a branch of the royal family of Valois, and were descended from Charles of Valois, who perished at the battle of Crecy in 1346. His grandson, John I., fell at Agincourt in 1415. His successor, John II., allying himself with the enemies of the court, was twice condemned to death, but pardoned both times. René, son of John II., also excited, not without cause, the suspicion of the French monarch, Louis XI., who confined him for three months in an iron cage at Chinon; but as the parliament had never condemned him, he was released at the death of Louis, and restored by Charles VIII. to his title and estate. René's son, who had married the sister of Francis I., was general of the advance guard of the French army in the Netherlands. He

commanded the left wing at the battle of Pavia, where, instead of supporting the king at a critical moment, he fled with his troops; and to him, therefore, has been attributed both the disastrous defeat sustained by the French, and his sovereign's falling into the hands of the enemy. With him expired the old house of A. The duchy was then given to the duke of Anjou. Louis XIV. conferred it upon the duke of Berri, and Louis XVI. on the count of Provence.

**ALEPPO**, a t. in the n. of Syria, capital of a Turkish vilayet of the same name, between the Orontes and the Euphrates, on the banks of the little desert stream, Nahr-el-Haleh. It stands in a large hollow, surrounded by rocky hills of limestone. The fruitful gardens, celebrated for their excellent plantations of pistachios, are the sole contrast to the desolation which environs the city, whose numberless cupolas and minarets, clean, well-paved streets, and stately houses, make it even yet one of the most beautiful in the east. It is a telegraph station in connection with Damascus, and with Diarbekir, on the Indo-European line, and contains (*Alman. de Göttingen*, 1879) 70,000 inhabitants. Formerly, it supplied a great part of the east with fabrics of silk, cotton, and wool, and gold and silver stuffs; but in 1822 an earthquake swallowed up two thirds of the inhabitants, and transformed the citadel into a heap of ruins. The plague of 1837, the cholera of 1832, and the oppression of the Egyptian government, all but completed its destruction. During the sway of the last, however, a new citadel and some other edifices were erected; but scarcely half of the mosques and baths have been rebuilt. The aqueduct is the oldest monument of the town. A. is one of the principal emporiums of the inland commerce of Asia. Its port is Alexandretta or Iskanderoun (q.v.). A. has a large trade in cotton and silk goods, skins, tobacco, wine, oil, etc. The value of the imports of Alexandretta in 1874 was £1,345,000; of the exports, £880,000. It was once the centre of Saracenic power, still retains much of the Arabic character, and its citizens are famed throughout the east for their elegant manners.

**ALES'**, or **ALESSE'**, **ALEXANDER**, original name **ALANE**, 1500-65; a native of Edinburgh. He studied at St. Andrew's, graduating in 1515; became canon of the collegiate church, and contended vigorously for scholastic theology as against the reformers. On the execution of Patrick Hamilton his views entirely changed, though he kept the fact a secret for a long time. For a sermon against dissoluteness among the clergy he was put in prison, whence he escaped to the continent, traveled in Europe, and settled in Wittenberg, where he made the acquaintance of Melancthon. Meantime he was tried in Scotland, and condemned for heresy, without a hearing. After Henry VIII. broke with the church of Rome, A. went to England, and was cordially received by the king and Cranmer and Cromwell, and through the latter's influence he was appointed lecturer on theology at Cambridge. In 1539, he was again compelled to exile himself in consequence of the statute known as the "Six Articles." He was at once chosen to a theological chair at Frankfort-on-the-Oder, and was the first professor who taught the reformed doctrines. In 1543, he quitted Frankfort for Leipsic, where he filled a similar professorship until his death.

**ALESH'KI**, a t. in s. Russia, on a branch of the Dnieper, 8 m. e. of Kherson; pop. '67, 8484.

**ALESIA**, a t. of ancient Gaul, the siege and capture of which form one of Cæsar's greatest exploits. The Gauls were making a last effort to shake off the Roman yoke; and Vercingetorix, their bravest leader, after several defeats, had shut himself up with 80,000 men in A., there to await the reinforcements which he expected from a general insurrection of the country. The t. was situated on a lofty hill, and well calculated for defense. Cæsar, with his army of 60,000 men, completely surrounded the place, with the view of starving it into a surrender. He fortified his position by two lines of ramparts of prodigious extent and strength; one towards the t., for defense against the sallies of the besieged; the other towards the plain, against the expected armies of relief. Before they could assemble, 250,000 strong, he was ready for them; and all their assaults, combined with the desperate efforts of the besieged, were of no avail. A. was obliged to surrender, and Vercingetorix was made prisoner. A. was afterwards a place of some note under the empire, but was destroyed by the Normans in 864. Near the site of the ancient A., w. of Dijon, stands the modern village of Alise or Sainte-Reine.

**ALESSANDRES'KU**, **GREGORY**, b. 1812; a Roumanian poet. He served in the army; was a liberal politician, and was banished to a monastery for publishing satires reflecting upon the government. In 1859 A. was minister of finance. He wrote *Reminiscences*, *Impressions*, *Letters*, and *Fables*.

**ALESSAN'DRI**, **BASIL**, b. 1821; a poet of Roumania. He was prominent in the liberal operations in 1848, and was for a short time minister of foreign affairs. His *Popular Ballads of Roumania* is a work well known.

**ALESSAN'DRIA**, the principal fortress and town of the province of the same name in the n. of Italy, is situated in a marshy country near the confluence of the Bormida and Tanaro. It was built in 1168 by the inhabitants of Cremona, Milan, and Placentia, as a bulwark against emperor Frederick I. Its original name was Cesarea, but it was afterwards called A. in honor of pope Alexander III., who established a bishopric in it. Designed at first as a fortress to guard the passage of the Bormida and Tanaro, and be-

ing the central point of intercourse between Genoa, Milan, and Turin, the town has frequently been the object of sanguinary strife. It was taken and plundered in 1522 by duke Sforza; besieged, but without success, by the French, under the prince of Conti, in 1657; and again taken, in spite of an obstinate resistance, by prince Eugene in 1707. After the prostration of Austria at the battle of Marengo in 1800, Bonaparte concluded an armistice at A. with his enemies, according to which, upper Italy, as far as the Mincio, was ceded to the French, with twelve fortresses. It was the principal armory of the Piedmontese during the insurrection of the Lombardo-Venetian states in 1848-9, when many new fortifications were added to it. At present, the citadel is one of the strongest fortresses in Europe; of enormous size, larger, it is said, than many a town, and in the event of a war in Italy, the whole surrounding country can be inundated by means of the sluices of the Tanaro. A. contains, exclusive of the garrison (1871), 29,102 inhabitants, who carry on a considerable trade in linens, woollens, silk fabrics, stockings, hats, etc. The culture of flowers is also much attended to. Two fairs are held in A. annually, which are largely frequented.

**ALESSANDRIA DELLA ROCCA**, a town of Sicily, in the province of Girgenti, and 17 m. n. by w. from Girgenti, picturesquely situated in a mountainous district. Pop. of commune, 5214.

**ALEUTIAN ISLANDS**, or the CATHERINE ARCHIPELAGO, is the name of a group of islands, numbering above 150, and consisting of several clusters, which now belong to the United States, and form an insular continuation of the N. American peninsula of Alaska (q.v.), in the shape of an arch or bridge between the former continent and Asia. They lie in 55° lat., separating the sea of Kamchatka from the Pacific, and naturally subdivide themselves into five groups: 1. the Komandorski islands, sometimes not regarded as belonging to the A. I.; 2. the Sasignan, or "Nearest" islands; 3. the Rat islands; 4. the Andreianowsky, which are very small and little frequented; 5. the Fox islands, among which is Unimak, the largest in the archipelago. The islands are all craggy, and have a desolate appearance from the sea. They exhibit traces of violent internal commotion. Several volcanoes are still periodically active, and warm volcanic springs are numerous. The whole chain or group forms a connecting link between the volcanic range of the west coast of America and Kamchatka. On account of the numerous rocks which lie off their shores, they are not very accessible to ships. Under a climate which exchanges only for a short time the monotonous rigor of winter for a cloudy spring and a hot summer, little can be expected of so niggardly a soil. There are plenty of low scrubby bushes, grasses, moss, and lichens, but no strong and stately growth of trees. An experiment tried at Unalaska of planting pines had very little success. Here and there, however, European kitchen-gardens have been attempted with better results; and the cultivation of the potato has likewise succeeded. The islands abound in springs, and are overrun with foxes, dogs, and reindeer, while the coasts swarm with fish, seals, and otters. The natives, reckoned now not to exceed 1500, though once numerous, are variously regarded as of Asiatic or American origin. Their occupation is hunting and fishing. Their trade is chiefly in furs and fish, of which the principal *entrepôt* is Alexandria, in the island of Rojak.

**ALEWIFE** (*Alosa tyrannus*), a fish of the same genus with the shad (q.v.), which, in the end of spring and beginning of summer, appears in great numbers on the eastern coast of N. America, and enters the mouths of rivers to spawn. It appears in Chesapeake bay in March, on the coasts of New York and New England in April, and on those of the British provinces about the 1st of May. It abounds in the bay of Fundy, but is more rare in the gulf of St. Lawrence; and the bay of Miramichi appears to be its northern limit. It ascends rivers only as far as the tide extends, and, after spawning, returns to the sea in the middle of summer. It prefers a soft, muddy bottom. Its length is not more than 12 inches. The A. is called *spring herring* in some places, and *gaspeau* by the French Canadians. It is inferior to the herring, yet it is a valuable fish. The fishery is prosecuted in the rivers, by small-meshed seine-nets, set across the stream. Large quantities are taken in the rivers of New England, New Brunswick, and Nova Scotia. The harbor of St John's, New Brunswick, alone produces from 12,000 to 20,000 barrels annually. This fish, in a salted state, forms a considerable article of export from the northern parts of America to the West Indies.

**ALEXANDER**, a co. forming the s.w. corner of Illinois, between the Ohio and Mississippi rivers; 245 sq.m.; pop. '70, 10,564. It is low, flat, and subject to inundations in some portions, but produces good corn and wheat. The Illinois Central railroad has its southern terminus at Cairo in this county. Co. seat, Thebes.

**ALEXANDER**, a co. in n.w. North Carolina, bounded on the s. by the Catawba river; 300 sq.m.; pop. '70, 6868—611 colored. The chief products are wheat, corn, and oats. Co. seat, Taylorsville.

**ALEXANDER, ALEXANDER HUMPHREYS**, b. 1783. He claimed the earldom of Stirling on the ground of blood, alleging that his mother was great-great-granddaughter of John, fourth son of the last earl of Stirling, and that all intermediate heirs were extinct. A trial was had in Scotland, where his pretensions were exposed, his old

documents were shown to be forgeries, and he retired into obscurity. One of his claims was the inheritance of Nova Scotia, granted to the first earl of Stirling.

ALEXANDER, ARCHIBALD, D.D., 1772-1851; b. Virginia; a Presbyterian minister of Scotch descent. He was self-educated; was led to religious study in the revival of 1789, was licensed to preach in 1791, and spent some years as an itinerant missionary; was president of Hampden-Sidney college, 1789-1801; in 1802 married the daughter of Rev. Dr. Waddell, the blind preacher whose eloquence was so eloquently eulogized by William Wirt; was pastor of Pine street Presbyterian church, Philadelphia, 1807-12; and having at the organization of the theological seminary of the Presbyterian church at Princeton, N. J., been unanimously chosen professor of theology, he retained the position with eminent success until his death. His best known work is *Outlines of the Evidences of Christianity*, which has been translated into many languages and is a textbook in colleges. He wrote also *Treatise on the Canon of the Old and New Testaments*; *History of the Patriarchs*; *History of the Israelitish Nation*; *Religious Experience*; *African Colonization*; *The Log College*; and *Moral Science*, which was published after his death.

ALEXANDER, JAMES WADDELL, D.D., 1804-59; b. Virginia; son of Dr. Archibald; graduated at Princeton college, 1820, and afterwards a tutor there; installed pastor of Presbyterian church at Charlotte C. H., Va., 1827, and of 1st church of Trenton, N. J., 1829; professor of belles lettres and Latin in Princeton college, 1833-44; pastor of Duane street church, New York, 1844-49; professor of ecclesiastical history, church government, and sacred rhetoric in Princeton seminary, 1849-51, when the Duane street church being reorganized as the Fifth avenue church at the corner of 19th street, he again became its pastor and continued to be until his death. He wrote for the *Biblical Repository*, *Princeton Review*, *Presbyterian*, *American Sunday School Union*, *American Tract Society*, and, under the name "Cassariensis," for the *Literary World*. Among his many works are *Consolation*; *Sacramental Discourses*; *Thoughts on Family Worship*; *Pain Words to a Young Communicant*; *Thoughts on Preaching*; *The American Mechanic and Workingman*; *Discourses on Christian Faith and Practice*; and a biography of his father.

ALEXANDER, JOHN HENRY, 1812-67; b. Maryland; author of *Treatise on Mathematical Instruments*, *Contributions to the History of Iron*, *Dictionary of Weights and Measures*, *International Coinage*, and other valuable works.

ALEXANDER, JOSEPH ADDISON, D.D., 1809-60; one of the most eminent American biblical scholars; son of Dr. Archibald; b. Philadelphia. He was a pupil of his father; graduated at Princeton college, 1826; was adjunct professor there of ancient languages and literature, 1830-33; instructor, associate professor, and professor of oriental and biblical literature in Princeton seminary, 1833-51; of church history and government, 1851-59; of New Testament literature and biblical Greek, 1859-60. Among his published writings are *The Psalms Translated and Explained*; *The Prophecies of Isaiah*; a treatise on church government; two volumes of sermons; and commentaries on books of the New Testament.

ALEXANDER, STEPHEN, LL.D., b. New York state, 1806; educated at Union college and Princeton theological seminary; became a tutor in Princeton college, 1833; adjunct professor of mathematics there, 1834-45; professor of mathematics, 1845-54; and professor of astronomy from 1840 to his retirement about 1877 as professor emeritus. During a part of this time he was also professor of natural philosophy. In 1860 he was at the head of the expedition to Labrador to observe the solar eclipse of July 18. He is the author of many scientific papers, chiefly astronomical, such as *Physical Phenomena attending Solar Eclipses*; *Origin of the Forms and Present Condition of some of the Clusters of Stars*; and *Harmonies in the Arrangement of the Solar System*.

ALEXANDER, WILLIAM, 1726-83; b. New York; a maj.-gen. in the revolution. He claimed the earldom of Stirling, and is generally known as lord Stirling. He was son of James Alexander, well educated and of high repute for scientific attainments. He was in England in 1755, and made an unsuccessful suit for the Stirling estates and titles; returned in 1761, and soon after married a daughter of Philip Livingston; succeeded his father as surveyor-gen., and was a member of the provincial council. He sided with the revolutionists and was made a col. in 1775, and brig.-gen. by congress in 1776. He was conspicuously brave in the battle of Long Island, where he was taken prisoner, after securing the retreat of most of his command; but he was soon exchanged, and made a maj.-gen. in Feb., 1777, and distinguished himself at Brandywine and Germantown. At Monmouth he led the left wing, and did much to secure the victory. He was commander at Albany in 1781. He was prominent in founding King's (now Columbia) college, and the Society library of New York city.

ALEXANDER, Sir WILLIAM, Earl of Stirling, 1580-1640; a poet of an eminent Scotch family. He was educated at Glasgow university; traveled on the continent; was tutor to the young earl of Argyll, and so found access to the court of James I. He wrote sonnets, the *Four Monarchical Tragedies*, *Elegy on the Death of Prince Henry*, the *Day of the Lord's Judgment*, *An Encouragement to Colonies*, and many poems. In 1621, Sept. 21, he received the most prodigious gift ever bestowed on a subject, viz., a "gift and grant" of Canada, including Nova Scotia and Newfoundland; a singular instance of royal ignorance of geographical limits in America; still Charles I. confirmed the grant but its further history must be sought in the romance of the peerage and of the law

courts. In 1626, A. was made secretary of state for Scotland, and in 1630 was created a peer as lord Alexander of Tullibody and viscount Stirling, and was made judge of the sessions in 1631. The next year he built the Argyle house, still one of the sights of Stirling. In 1633, he was made earl of Stirling and viscount of Canada, and in 1639 earl of Doon.

ALEXANDER-ALEXANDROVITCH, b. Mar. 10 (Feb. 26, Russian date), 1845; eldest living son of the emperor Alexander II. of Russia, and heir to the throne; aid-de-camp and gen. in the suite of the emperor, gen. of cavalry and infantry, corps commander of the garde imperiel, etc. He married, Nov. 9 (Oct. 28), 1866, Marie Sophie Frederick Dagmar, daughter of Christian IX., king of Denmark. They had, July, 1879, three children—Nicholas, b. 1868, grand duke; George, b. 1871, grand duke; and Xenie, b. 1875, grand duchess.

ALEXANDER BALAS, professed son of Antiochus Epiphanes, who became king of Syria. He became hateful for debauchery, and the crown was claimed by Demetrius Nicator, whom he met in battle. A. was defeated and fled to Arabia, where he was murdered, 145 B.C.

ALEXANDER (ALEXIS, or ALEXIUS) I., COMNENUS, 1182-1222; a descendant of the great Comneni family, rulers of Constantinople. His father was killed, and his mother fled with him and his brother David to a relative, the Georgian queen of Tiflis, who raised and educated the children. On the second capture of Constantinople, 1204, A. and his brother led some disaffected Greeks to the capture of Trebizond and the neighboring Black sea coast, while David took Sinope, and threatened Constantinople. A. became ruler of all Anatolia, but was in perpetual war with the Turks and the petty emperor of Nicæa. When he died his empire was a mere strip along the Black sea, between the Phasis and the Thermodon.

ALEXANDER JANNÆUS, third son of John Hyrcanus and first prince of the Maccabees who for any considerable period enjoyed the title of king (from 104 to 78 B.C.). He was warlike and enterprising, but was badly defeated in Galilee by Ptolemy, the son of Cleopatra of Egypt. A. then made an alliance with Cleopatra, and after some defeats captured several towns on the Mediterranean, the last being Gaza, which he reduced to utter ruin, B.C. 96. He was next called to Jerusalem to put down an insurrection, which he did after sacrificing 6000 lives, and soon after sacrificed 5000 more in a second insurrection. In still another rebellion A. was victorious, when he made a great entertainment for his friends, at which, as a part of the enjoyment, he had 800 rebels crucified in his presence, and their wives and children butchered before their eyes before they expired. Thenceforward A. became a sot, and d. from a fever caused by excessive drinking, B.C. 78, leaving two sons, Hyrcanus and Aristobulus, whose contentions down to the time of Herod the great had the effect of ruining the family.

ALEXANDER NEWSKI, or NEVSKI, a Russian hero and saint. b. at Vladimir in 1219 A.D., was the son of the grand duke Jaroslav, of Novgorod. In order to defend the empire, which was attacked on all sides, but especially by the Mongols, his father quitted Novgorod, leaving the cares of the government to his sons, Fedor and Alexander, the former of whom died soon afterwards. The latter vigorously resisted the enemy; yet Russia was forced to submit to the Mongol dominion in 1238 A.D. A. now fought to defend the western frontier against the Danes, the Swedes, and the Teutonic knights. He received the surname of Newski, on account of the splendid victory over the Swedes, which he achieved in 1240, on the Newa (Neva), in the province where St. Petersburg now stands. In 1242 A.D., on the ice of lake Peipus, he defeated the Livonian knights of the sword, who had been stimulated by the pope to attack the Russian heretics. At the death of his father in 1247, he became grand duke of Vladimir. Pope Innocent IV. now made a diplomatic attempt to reunite the Greek and Roman churches, since his military scheme had failed, and with this view sent an embassy to A., which, however, proved as ineffectual as the former. To the end of his life, however, he remained a vassal of the Tartars or Mongols. Thrice had he to renew his oath of fealty to the Asiatic barbarians, making in each instance a journey to their camp. He died in 1263 A.D., at Kassimcow, on his return from the last of these journeys; and the gratitude of the nation perpetuated his memory in popular songs, and even canonized him. Peter the great honored his memory by building a magnificent convent on the spot where A. had fought his great battle, and by founding the knightly order of A. N.

ALEXANDER OF APHRODISIAS, lived in the 2d and 3d c., A.D.; the most celebrated of Greek commentators on Aristotle, and styled "the expositor." He was a native of Aphrodisias, and taught peripatetic philosophy at Athens. His commentaries, many of which are extant, were especially esteemed by the Arabs. He also wrote original works, of which the most important is *On Fate*, in which he argues against the Stoic doctrine of necessity; and one *On Soul*, in which he holds that the undeveloped reason in man is material and inseparable from the body. He identified the active intellect with God.

ALEXANDER OF HALES (in Latin, Alexander Halensis), a famous theologian, known as the "irrefragable doctor;" d. 1245. He was originally an ecclesiastic in Gloucestershire, but had attended the schools of Paris, got the degree of doctor, and had become a

noted professor of philosophy and theology there, when (1223) he suddenly entered the order of the Minorite friars. From that time, he lived the life of a studious recluse. His chief and only authentic work is the *Summa Universæ Theologiæ* (best ed., Venice, 1576, 4 vols.), written at the command of pope Innocent IV., and enjoined by his successor, Alexander IV., to be used by all professors and students of theology in Christendom. A. gave the doctrines of the church a more rigorously syllogistic form than they had previously had, and may thus be considered as the author of the scholastic theology. Instead of appealing to tradition and authority, he deduces with great subtlety, from assumed premises, the most startling doctrines of Catholicism, especially in favor of the prerogatives of the papacy. He refuses any toleration to heretics, and would have them deprived of all property; he absolves subjects from all obligation to obey a prince that is not obedient to the church. The spiritual power, which blesses and consecrates kings, is, by that very fact, above all temporal powers, to say nothing of the essential dignity of its nature. It has the right to appoint and to judge these powers, while the pope has no judge but God. In ecclesiastical affairs, also, he maintains the pope's authority to be full, absolute, and superior to all laws and customs. The points on which A. exercises his dialectics are sometimes simply ludicrous; as when he discusses the question whether a mouse that should nibble a consecrated wafer would thereby eat the body of Christ. He arrives at the conclusion that it would.

**ALEXANDER I., PAULOWITSCH**, Emperor and autocrat of all the Russias (1801-25), was b. Dec. 23, 1777. His education, in which his father, Paul I., had no hand, was conducted by his grandmother, Catharine II., and col. Labarpe and other tutors. He always showed great affection for his mother, Maria, daughter of Eugene, duke of Württemberg. With a humane and benevolent disposition, the "northern Telemachus" was imbued by Labarpe with the enlightened principles of the age. Prof. Kraft instructed him in experimental physics, and Pallas in botany. It was thought better not to devote his attention to poetry and music, as it would have required too much time to make any great acquirements. In 1793 he married Elizabeth, daughter of Karl Ludwig, crown prince of Baden, and on the assassination of his father Paul (q.v.), on the 24th of March, 1801, succeeded him upon the throne. Although A. doubtless knew of the conspiracy to dethrone his father, there is no reason to believe that he contemplated the crime of murder. His accession was celebrated by Klopstock in an ode, *To Humanity*, indicative of the high expectations formed of him. The young ruler seemed deeply penetrated with a sense of his obligation to make his people happy and to promote their civilization and prosperity. He was the first to lay the foundation of the national culture and popular instruction on a regular plan, to introduce organization into the internal administration, unshackle the industry of the nation, raise the foreign commerce of Russia, and awaken in the people a feeling of unity and a spirit of patriotism.

Of specific internal improvements effected by A., his exertions on behalf of the language, literature, and general culture of the Slavonic nations deserve special notice. Seven universities, at Dorpat, Kasan, Charkow, Moscow, Wilna, Warsaw, and St. Petersburg, were either instituted or remodeled by him; 204 gymnasiums and normal schools, and above 2000 district elementary schools, were erected; and fresh life and activity given to the higher scientific institutions in St. Petersburg and Moscow. He did more than any other sovereign in Europe for the spread of the Bible, by supporting the Bible society (which was suppressed, however, in 1826); and in 1820 he had a bishop instituted for the evangelical Lutheran church, and a general consistory in St. Petersburg for the whole empire. He devoted large sums to the printing of important works, such as Krusenstern's *Travels* and Karamsin's *History of Russia*, and prized and rewarded scientific merit both at home and abroad. Several scientific collections were purchased by him, and in 1818 he invited two orientalists, Demange and Charmoy, from Paris to St. Petersburg, to promote the study of the Arabic, Armenian, Persian, and Turkish languages. Young men of talent were sent to travel at his expense. By the ukase of 1816 he prepared the way for the abolition of slavery in the Baltic provinces; he also declared that no more gifts of peasants would be made on the crown-lands. As early as 1801 he had abolished the secret tribunal which is said to have extorted confession from political offenders by means of hunger and thirst. The practice of slitting the nose and branding, which had been customary in connection with knouting, was also done away with. Laws were enacted to prevent the abuses of power by governors. The privilege of the nobles, that their inherited property could not be confiscated as a punishment, was raised by him to a common right for all subjects; and much was done in composing a code of civil law. He promoted the manufactures and trade of the empire by amending the laws regarding debt and mortgages, and by the institution of an imperial bank, the construction of roads and canals, making Odessa a free port, and, above all, by the ukase of 1818, permitting all peasants in the empire to carry on manufactures, which was before only allowed to nobles and to merchants of the first and second guilds.

A.'s far-sighted policy with regard to the foreign commerce of Russia is shown in various expeditions round the world sent out by him; in the embassy to Persia in 1817, in which was the Frenchman Gradanne, who was acquainted with all the plans of Napoleon respecting India and Persia; in the missions to Cochin China and to Khiva;

in the treaties with the United States, Brazil, and Spain; in the naval and commercial treaties with the Porte; and in the settlement on the n.w. coast of America.

A.'s foreign policy was characterized at the outset by a desire for peace; in 1801 he concluded a convention putting an end to hostilities with England, and made peace with France and Spain. He next entered, along with France, into negotiations respecting the indemnification of the minor states in Germany and Italy, but soon discovered how little the French ruler intended any real compensation. As Bonaparte encroached more and more, took possession of Hanover, and annihilated Holland, A. broke with France, and joined the coalition of 1805. He was present at the battle of Austerlitz, when the allied armies of Austria and Russia were defeated, and retired with the remains of his forces into Russia, declining to enter into the treaty that followed. Next year he came forward as the ally of Prussia; but after the disastrous battles of Eylau and Friedland, in 1807, he was obliged to conclude the peace of Tilsit, in which he managed to prevent the restoration of the kingdom of Poland, and to mitigate the hard fate of the king of Prussia. During the war with France, A. had also to carry on hostilities with Persia and with Turkey.

Dazzled by the fortune and genius of Napoleon, A., in pursuance of the stipulations of Tilsit, acceded with his huge empire to the French continental system, thus altering entirely the foreign policy of Russia. He began by declaring war on England in 1808, and attacking her ally Sweden, wrested from that country, by the peace of Friedrichshamn (1809), the province of Finland. On the other hand, the Russian fleet, sent to the aid of the French at Lisbon, fell into the hands of the British. In the autumn of 1808, the two great potentates held a meeting at Erfurt, attended with great splendor, at which A. represented, as it were, the empire of the east of Europe, while Napoleon assumed the dominion of the west. In the war of France against Austria in 1809, A. took only a lukewarm part, although at the peace of Vienna he received the circle of Tarnopol as his share of the spoil of Galicia. Against the Porte, which had not observed the armistice of Slobosta, he renewed the war, which was continued till the peace of Bucharest in 1812.

The alliance, however, of A. with the Corsican conqueror involved such an inconsistency, and was so contrary to the real interests of Russia, that a rupture and a complete change of the Russian policy were inevitable. The pressure of the continental system on the material resources of Russia, the despotic changes made by Napoleon, the augmentation of the duchy of Warsaw, the proffers of alliance by England and Sweden, awoke in A. first discontent and aversion, and soon the thought of a decisive contest against the subjugator of Europe and the disturber of the peace of the world. When this gigantic struggle at last began (1812), Russia brought into the field an army of nearly 900,000 men. During this war (see RUSSO-GERMAN WAR), A. repeatedly exposed himself to personal danger, in order to fire the courage and patriotism of his troops. His magnanimity towards France after the taking of Paris facilitated the negotiations for peace, and won for him great personal regard, amounting to a kind of enthusiasm. He was received with the same feeling in London, which he visited after the treaty of Paris in June, 1814. When he returned to St. Petersburg, his first care was to provide for the wounded, and for the families of the soldiers that had fallen. The senate wished to give him the title of "blessed," which, from Christian humility, he declined. After a short residence in his own capital, he repaired to the congress of Vienna. Here he laid claim to Poland as essential to the interests of Russia, but promised to confer on it a constitution, and, on the whole, appeared to act for the good of humanity and the freedom of nations.

In the return of Napoleon, A. saw the confusion of Europe begun again, and therefore urged the fulfillment of the treaty of Chaumont and the outlawry of the common enemy. His appearance in the French capital after the battle of Waterloo raised less enthusiasm than previously; yet on this occasion, too, France owed much to his generosity. It was about this time that the tendency of A. to pietism, fostered by intercourse with Madame Krüdener (q.v.), was most strongly manifested, and exercised decided influence on his political views. It was under the influence of this religiosity that he founded the holy alliance (q.v.), the ostensible object of which was to make the principles of Christianity be recognized in the political arrangements of the world, but which became, in fact, a mere handle for political reaction.

In the end of Oct., 1815, A. returned to his own dominions. His policy, and the march of events, had completely changed the internal condition of Russia and her foreign relations. Her weight in European politics had become powerful; the limits of the empire had extended in all directions; and notwithstanding the war, the earlier legislative reforms had begun to act favorably on the industry and well-being of the nation. After 1805, A. had remodeled the army after the fashion of the western powers, and raised it to a condition that menaced Europe. When peace was attained, he not only sought to heal the wounds inflicted by the war, but to carry forward the work of reform formerly begun. Numerous administrative abuses were done away with, and the condition of the peasants was more and more alleviated. In 1816, the Jesuits, who were causing a great deal of disturbance, were made to leave St. Petersburg and Moscow, and in 1820 were sent out of the empire. On the other hand, proselytism was rigidly prohibited, and the Duchoborzes, a sect of the Russo-Greek church, were allowed the free exercise of worship.

But however good A.'s intentions might be, his internal policy met with obstructions, partly arising from his personal views and character, partly from the nature of his position. Affected with a morbid religiosity, worn out and shaken perhaps in body and mind by the vast events in the vortex of which he had moved for the last ten years, the emperor became possessed of a dread of another European revolution; and the political struggles against reaction in Germany, and the outbreaks against despotism in Italy and Spain, appeared to him as the beginning of a new and terrible catastrophe. The attention now bestowed by A. on foreign relations threw internal improvements into the background; and the liberal reformer and pupil of Laharpe found himself involved in hopeless inconsistency, when he fully concurred in the policy of the Austrian cabinet, and, at the congresses of Troppau, Laybach, and Verona, helped to crush, along with the insurrections, the just requirements and political progress of the nations.

This complete reversal of policy could not fail to produce fruits, especially as Russia peculiarly abounded in fermentable materials. Poland saw itself completely disappointed in its national expectations, and required the actual carrying out of the promised constitution. The contact into which the Russians had come during the war with the civilization and institutions of the western nations, had excited in different classes of Russian society wishes and views by no means compatible with their condition at home. On the other hand, there had long existed in the most influential circles an Old-Russian party, who either found their interests hurt by the enlightened measures of the emperor, or saw in them the downfall of the national church, and of the nation itself. Besides, the army was kept up on the war-footing, and in 1831 numbered about 830,000 regular troops; and this pressed severely on the people, and produced discontent, along with exhaustion and disorder of the finances. To meet this evil, A. began the planting of military colonies, which, however, met with insuperable obstacles in the execution, and did not attain the end in view. But to exorcise the spirit of political discontent and the phantom of a Russian revolution, the emperor adopted the same measures that were very generally applied over the rest of Europe with similar views. The censorship of the press, and a rigid guard over the importation of books, were again introduced; restrictions were put on science, literature, and education; inquiries instituted into all democratic movements; mason-lodges and missionary societies suppressed; and gradually all plans for reform and progress given up. Over all the provinces of the empire, a net of police, open and secret, was spread, which interfered with the ordinary intercourse of society.

The experience that, in spite of this system of repression, public opinion could not be stifled, and that parties and individuals only expressed themselves more bitterly; the variance with his former self in which A. found himself involved; and the difficulties of governing the huge empire, which were now becoming more manifest and startling—all this tormented and embittered his morbid mind, and led him to complain of ingratitude and of a want of recognition of his good intentions. Sometimes he sought to forget his position in the dissipations of a splendid court, in which luxury and piety were strangely blended; at other times, he plunged into the darkness of religious mysticism. The progress of the revolt in Greece brought the policy of the emperor into complete opposition to public opinion and the most sacred sympathies of the nation. The Russian people, restrained from all participation in political movements, were profoundly affected by the religious element of the Greek struggle; but the emperor condemned the rising as insurrection, disclaimed the favor he had formerly shown to the Greek cause, and confined himself to exhortations to the Porte to act with humanity. The death of his only and much-loved natural daughter, the terrible inundation suffered by St. Petersburg in 1824, in which he exposed himself to personal danger, and the alarm caused by a Russo-Polish conspiracy against all the members of the house of Romanow, contributed not a little to break the heart of the emperor, and completely destroy the composure of his mind. Sick in body, weary of life, and possessed by thoughts of death, he commenced, in Sept., 1825, a journey to the Crimea, with a view to benefit the health of the empress, who was ailing, and that he himself might enjoy retirement. Leaving the empress at Taganrog, he continued his journey, but was suddenly seized by a fever peculiar to the country, and obliged to return to Taganrog. Here, in spite of all care, he became worse, and died, Dec. 1, 1825. The rumor that he had been poisoned is altogether groundless. He is said to have learned, shortly before his death, the details of the conspiracy which his brother and successor, Nicholas I. (q.v.), had to begin his reign by putting down.—See Choiseul-Gouffier's *Mémoires Historiques sur l'Empereur Alexandre et la Cour de Russie*, Paris, 1829; and *Alexander I.: His Life and Times*, by C. Joyneville, London, 1875.

**ALEXANDER II.**, Emperor of Russia, was b. April 29, 1818. He was carefully educated by his father, Nicholas, who professed himself delighted with the manifestations of "true Russian spirit" in his son. At 16, he was declared of age, made commandant of the lancers of the guard, hetman of the Cossacks, first aide-de-camp of the emperor, and subjected daily to a life of manœuvring, reviewing, and military parade, which at last seriously injured his health. He then traveled through Germany to recruit his energies, and while there, concluded a marriage with the princess Maria, daughter of the grand duke of Darmstadt, in 1841. He now vigorously applied himself to his duties as chancellor of the university of Finland. By his dexterous and subtle manners, he

insinuated himself into the affections of the Finns, and weakened their love of independence. He founded a chair of the Finnish language and literature, and defrayed the expenses of remote explorations undertaken by their *savans*, such as Cygnaeus, Wallin, and Castren. In 1850, he visited southern Russia, Nicolaïeff, Sebastopol, Tiflis, Erivan, etc. It is said that he witnessed with regret the attitude which his father assumed towards Europe, and that he altogether disapproved of the Crimean war. On his accession to the throne, Mar. 2, 1855, he found himself in a very critical position. He had two parties to conciliate at home—the old Muscovite party, blindly zealous for war, and the more peaceable and intelligent portion of the nation, who possessed his personal sympathies. He pursued a course calculated to encourage both; spoke of adhering to the policy of his “illustrious ancestors,” and at the same time concluded peace. Since then he has shown a strong desire to purge the internal administration of its impurities; he has sharply rebuked the corruption of functionaries, and severely punished some, as a warning to the rest. An honorable recognition has been given to public instruction, which he has placed under his own superintendence. By a ukase of May 27, 1856, he granted to all Polish exiles, who were willing to express repentance for the past, permission to return home; but though desirous of preserving the nationality of Poland, he will not have it separated from the “great Russian family.” The grand achievement of his reign, however, is the emancipation of the serfs—23,000,000 souls—by a ukase of Mar. 8, 1861. This marks an epoch in the national history. In 1865, A. established elective representative assemblies in the provinces. He carried on wars against Bokhara in 1866; Khiva, in 1873; and Khokan, in 1875-76. The czar took the field with the army during the momentous war between Russia and Turkey, in 1877-78.

**ALEXANDER I.** King of Scotland, a younger son of Malcolm Ceanmor (big-head), succeeded his brother, Edgar, in 1107, and amidst incessant disturbances, governed Scotland for 17 years with great ability. In addition to good natural powers, he had enjoyed, through his mother, Margaret of England, the advantages of a higher mental cultivation than any of his predecessors. One of the most formidable insurrections which his prompt energy enabled him to quell, was that excited in 1120 by Angus, great grandson of the wife of Macbeth; in allusion to which, old Wynton says:

Fra that day forth his lieges all  
Used him Alexander the fierce to call.

His determined resistance to the pretensions of the English hierarchy secured the independence of the Scottish church, while his liberal patronage of the monasteries promoted her strength at home. In 1123 he founded the abbey of Inchcolm. He died at Stirling in 1124.

**ALEXANDER II.** was b. in 1198; succeeded his father, William the Lion, in 1214. He early displayed that wisdom and strength of character, in virtue of which he holds so high a place in history among Scottish kings. The first act of his reign was to enter into a league with the English barons who had combined to resist the tyranny of king John. This drew down upon him and his kingdom the papal excommunication; but two years subsequently (1218), the ban was removed, and the liberties of the Scottish church were even confirmed. On the accession of Henry III. to the English throne, A. brought the feuds of the two nations to a temporary close by a treaty of peace (1217), in accordance with which he married Henry's eldest sister, the princess Joan (1221). The alliance thus established was broken after the death, without issue, of queen Joan (1238), and the second marriage of A. with the daughter of a nobleman of France. In 1244, Henry marched against Scotland, to compel A.'s homage. In this emergency, the Scottish king received the steady support of the barons, whose ordinary policy was opposition to the crown, and is said, in a short time, to have found himself at the head of 100,000 foot, and 1000 horse. A peace was concluded without an appeal to arms. While engaged in one of those warlike expeditions which the turbulence of his subjects so frequently rendered necessary, A. died of fever at Kerrera, a small island opposite Oban, on the w. coast of Argyleshire, in the 35th year of his reign.

**ALEXANDER III.** succeeded his father, A. II., on the Scottish throne, at the age of 8, and, two years later, in 1251, he married the princess Margaret, eldest daughter of Henry III. of England. The tender age of the sovereign enabled Henry to prosecute successfully for some time his schemes for obtaining entire control over the Scottish kingdom; but long before he reached manhood, A. displayed so much energy and wisdom as to give assurance that when the administration of affairs should come under his personal direction, it would be vain to think of reducing him to submission. Very shortly after he had come of age, his energies were summoned to the defense of his kingdom against the formidable invasion of Haco, king of Norway (1263), who claimed the sovereignty of the western isles. In attempting a landing at Largs, on the coast of Ayr, the Norwegian prince sustained a total defeat; and A., as the result of this important victory, secured the allegiance both of the Hebrides and of the Isle of Man. The alliance between Scotland and Norway was strengthened in 1282 by the marriage of A.'s only daughter, Margaret, to Eric, king of Norway. This princess died in the following year, leaving an infant daughter, Margaret, commonly designated the Maiden of Norway, whose untimely death, on her way to take possession of her throne, was the occasion of so many calamities to Scotland. During the concluding years of A.'s reign, the kingdom enjoyed

a peace and prosperity which it did not taste again for many generations. The justice, liberality, and wisdom of the king endeared his memory to his subjects, while the misfortunes that followed his death heightened the national sense of his loss. His only son, A., who had married the daughter of Guy, count of Flanders, died without issue in 1284. A. contracted a second marriage in 1285 with Joleta, daughter of the count de Dreux. The hopes of the nation were soon after clouded by his untimely death. Riding on a dark night between Burntisland and Kinghorn, he fell with his horse over a precipice, and was killed on the spot.

**ALEXANDER VI. (BORGIA)**, 1492-1503, the most celebrated of the eight popes (see POPES) of this name, but at the same time the most infamous one that ever lived, as well as the most vicious prince of his age. His most conspicuous qualities were a cunning and insidious cruelty, united with great fearlessness in danger, an unwearied perseverance and vigilance in all his undertakings, a soft and plausible manner towards his inferiors, a harsh and grasping spirit towards the rich. In spite of his talents and his love of art and science, he disclaimed, throughout his dissolute career, no means of gratifying his lust—not even perjury, murder, and poisoning. He was born at Valencia, in Spain, 1480. His own name was Rodrigo Lenzuoli, but he assumed the ancient and famous one of his mother's family, Borgia. He had five children by Rosa Vanozza, a woman celebrated for her beauty, two of whom equaled himself in criminality, Cæsar and Lucretia (see BORGIA). A. was made a cardinal by his uncle Calixtus III., and on the death of Innocent VIII., was elevated to the papal chair, which he had previously secured by flagrant bribery. The long absence of the popes from Italy had weakened their authority and curtailed their revenues. To compensate for this loss, A. endeavored to break the power of the Italian princes, and to appropriate their possessions for the benefit of his own family. To gain this end he employed the most execrable means. He died in 1503, from having partaken, by accident, as is commonly believed, of poisoned wine intended for his guests. Under his pontificate, the censorship of books was introduced, and Savonarola, the earnest and eloquent Florentine priest, who had advocated his deposition, was condemned to be burned as a heretic.

**ALEXANDERS**, *Smyrnium olusatrum*, a biennial plant of the natural order *umbellifera* (q.v.), found in waste ground, near ruins, etc., in Britain and the s. of Europe. The stem is 3 to 4 ft. high, very stout and furrowed; the leaves twice or thrice ternate, stalked, serrate, of a bright yellowish-green color; the leaflets very large. The flowers are yellowish-green, in very dense, numerous rounded umbels, destitute of involucre; the fruit almost black. The plant has an aromatic taste, strong and pungent, but becomes rather pleasant when blanched, and was formerly much cultivated and used in the same way as celery, although at present it is little regarded. The frequency of its occurrence near ruins in Britain, may probably be referred to its former cultivation. The fruit is carminative.—*S. perfoliatum*, a native of Italy, with the upper stem-leaves embracing the stem, is used in the same way.—The genus *smyrnium* contains only a few known species, chiefly natives of the temperate parts of the n. hemisphere. It has compound umbels; the involucre variable; the calyx obsolete; the petals inflected at the point; the fruit consisting of 2 nearly globose carpels, each with 3 sharp dorsal ribs; the lateral ones obsolete; several vittæ in the interstices; the albumen involute.

**ALEXANDER SEPTĒRUS**, a Roman emperor (222-235 A.D.), was the cousin, adopted son, and successor of Heliogabalus. The excellent education which he received from his mother, Julia Mamaea, rendered him one of the best princes in an age when virtue was reckoned more dangerous than vice in a monarch. He sought the society of the learned; Paulus and Ulpian were his counselors, Plato and Cicero were, next to Horace and Virgil, his favorite authors. Although a pagan, he revered the doctrines of Christianity, and often quoted that saying: "Whatsoever ye would that men should do to you, do ye so also to them." Beloved as he was by the citizens on account of his equity, he soon became an object of hatred to the unruly prætorian guards. His first expedition, against Artaxerxes, king of Persia, was happily terminated by a speedy overthrow of the enemy. But during one which he undertook against the Germans on the Rhine, to defend the frontiers of the empire from their incursions, an insurrection broke out among his troops, headed by Maximin, in which Alexander was murdered, along with his mother, not far from Mentz. The grateful people, however, placed him among the gods. After his death, military despotism obtained the ascendancy, and the Roman power rapidly declined.

**ALEXANDER THE GREAT**, son of Philip of Macedon and Olympias, daughter of Neoptolemus of Epirus, was b. at Pella, 356 B.C. Endowed by nature with a happy genius, he early announced his great character. Philip's triumphs saddened him. On one occasion he exclaimed: "My father will leave nothing for me to do." His education was committed first to Leonidas, a maternal relation, then to Lysimachus, and afterwards to Aristotle. This great philosopher withdrew him to a distance from the court, and instructed him in every branch of human learning, especially in what relates to the art of government, while at the same time he disciplined and invigorated his body by gymnastic exercises. As Macedon was surrounded by dangerous neighbors, Aristotle was anxious to inspire his pupil with military ardor, and with this view recommended him to

study the *Iliad*, a revision of which he himself undertook for his use. A. was 16 years of age when his father marched against Byzantium, and left the government in his hands during his absence. Two years afterwards, he displayed singular courage at the battle of Chaeronea (338 B.C.), where he overthrew the sacred band of the Thebans. "My son," said Philip, as he embraced him after the conflict, "seek for thyself another kingdom, for that which I leave is too small for thee." The father and son quarreled, however, when the former repudiated Olympias. A. took part with his mother, and fled, to escape his father's vengeance, to Epirus; but receiving his pardon soon afterwards, he returned, and accompanied him in an expedition against the Triballi, when he saved his life on the field. Philip being appointed generalissimo of the Greeks, was preparing for a war with Persia, when he was assassinated (336 B.C.), and A., not yet 20 years of age, ascended the throne. After punishing his father's murderers, he went into the Peloponnesus, and in a general assembly of the Greeks he caused himself to be appointed to the command of the forces against Persia. On his return to Macedon, he found the Illyrians and Triballi up in arms, whereupon he marched against them, forced his way through Thrace, and was everywhere victorious. But now the Thebans had been induced, by a report of his death, to take up arms, and the Athenians, stimulated by the eloquence of Demosthenes, were preparing to join them. To prevent this coalition, A. rapidly marched against Thebes, which, refusing to surrender, was conquered and razed to the ground: 6000 of the inhabitants were slain, and 30,000 sold into slavery; the house and family of the poet Pindar alone being spared. This severity struck terror into all Greece. The Athenians were treated with more leniency, A. only requiring of them the banishment of Charidemus, who had been most bitter in his invectives against him.

A. having appointed Antipater his deputy in Europe, now prepared to prosecute the war with Persia. He crossed the Hellespont in the spring of 334 B.C., with 30,000 foot and 5000 horse, attacked the Persian satraps at the river Granicus, and gained a complete victory, overthrowing the son-in-law of Darius with his own lance. The only real resistance the Macedonians met with was from the Greek auxiliaries of the Persians, who were marshaled in phalanxes, under the command of Memnon of Rhodes, but finally they were all slain except 2000, who were taken prisoners. A. celebrated the obsequies of his fallen warriors in a splendid manner, and bestowed many privileges on their relations. Most of the cities of Asia Minor, Sardis not excepted, opened their gates to the conqueror, nor did Miletus or Halicarnassus offer longer resistance. A. restored democracy in all the Greek cities, cut the Gordian-knot (q.v.) with his sword as he passed through Gordium, and proceeded to the conquest of Lycia, Ionia, Caria, Pamphylia, and Cappadocia. His career was checked for a time by a dangerous illness, brought on by bathing in the Cydnus. On this occasion he displayed his magnanimity in the following circumstances. He received a letter from Parmenio, insinuating that Philip, his physician, intended to poison him, having been bribed by Darius. A. handed the letter to Philip, and at the same time swallowed the draught which had been prepared for him. As soon as he recovered, he advanced towards the defiles of Cilicia, in which Darius had stationed himself, with an army of above 500,000 men. He arrived in Nov., 333 B.C., in the neighborhood of Issus, where a battle took place, between the mountains and the sea. The disorderly masses of the Persians were thrown into confusion by the charge of the Macedonians, and fled in terror. On the left wing 30,000 Greeks, in the pay of the Persian king, held out longer, but they, too, were at length compelled to yield. All the treasures as well as the family of Darius fell into the hands of the conqueror, who treated the latter with the greatest magnanimity. The king, who fled towards the Euphrates, twice made overtures of peace, which A. haughtily refused, saying that Darius must regard him as the ruler of Asia, and the lord of all his people. One of the conditions of the second overture was that A. should possess all Asia to the Euphrates. On hearing which, his general, Parmenio, exclaimed: "I would do it, if I were A." "So would I," replied the monarch, "if I were Parmenio." The victory at Issus opened the whole country to the Macedonians. A. now turned towards Syria and Phœnicia, to cut off Darius's escape by sea. He occupied Damascus, where he found princely treasures, and secured to himself all the cities along the shores of the Mediterranean. Tyre, confident in its strong position, resisted him, but was conquered and destroyed, after seven months of incredible exertion (332 B.C.). Thence he marched victoriously through Palestine, where all the cities submitted to him except Gaza, which shared the same fate as Tyre. Egypt, weary of the Persian yoke, welcomed him as a deliverer; and in order to strengthen his dominion here, he restored all the old customs and religious institutions of the country, and founded Alexandria in the beginning of 331 B.C., which became one of the first cities of ancient times. Thence he marched through the Libyan desert, in order to consult the oracle of Jupiter Ammon, whose priest saluted him as a son of Jove; and at the return of spring went against Darius, who had assembled an army in Assyria. A battle ensued, in Oct., 331 B.C., on the plains of Arbela, or rather Guagamela—for Arbela, the point to which A. pursued the Persians, is 50 m. from the scene of the fight. See ARBELA. Notwithstanding the immense superiority of his adversary, who had collected a new army of 500,000 men, A. was not for a moment doubtful of victory. Heading the cavalry himself, he rushed on the Persians, and put them to flight; but as soon as he had entirely dispersed them, he hastened to the assistance of his left wing, which, in the mean while, had been sorely pressed. He was anxious to make a prisoner of the Persian king him

self, but the latter escaped by flight on horseback, leaving his baggage and all his treasures a prey to the conqueror. Babylon and Susa, the storehouses of the treasures of the east, opened their gates to the conqueror, who next marched towards Persepolis, the capital of Persia, which he entered in triumph.

The marvelous successes of A. now began to dazzle his own judgment, and to inflame his passions. He became a slave to debauchery, and his caprices were as cruel as they were ungrateful. In a fit of drunkenness, and at the instigation of Thais, an Athenian courtesan, he set fire to Persepolis, the wonder of the world, and reduced it to a heap of ashes; then, ashamed of the deed, he set out with his cavalry to pursue Darius. Learning that Bessus, the satrap of Bactriana, held the king a prisoner, he hastened his march, in the hope of saving him, but he found him mortally wounded on the frontiers of that country (330 B.C.). He mourned over his unfortunate enemy, and caused his body to be buried with all the usual rites observed in Persia; but he pursued Bessus, who himself aspired to the throne, through Hyrcania, Iran, Bactriana, over the Oxus to Sogdiana (now Bokhara), whose satrap, Spitamenes, surrendered Bessus to him. Having discovered a conspiracy in which the son of Parmenio was implicated, he put both father and son to death, though Parmenio himself was innocent of all knowledge of the affair. This cruel injustice excited universal displeasure. In 329 he penetrated to the furthest known limits of northern Asia, and overthrew the Scythians on the banks of the Jaxartes. In the following year, he subdued the whole of Sogdiana, and married Roxana, whom he had taken prisoner. She was the daughter of Oxyartes, one of the enemy's captains, and was said to be the handsomest of the virgins of Asia. A new conspiracy broke out against A., at the head of which were Hermolaus and Callisthenes, a pupil of Aristotle, which occasioned the death of many of the culprits; while Callisthenes himself was mutilated, and carried about in an iron cage through the army, till some one put an end to his sufferings by poison.

In the year 327 B.C., A. proceeded to the conquest of India, then known only by name. He crossed the Indus near to the modern Attock, and pursued his way under the guidance of a native prince to the Hydaspes (modern Jelum), where he was opposed by Porus, another native prince, whom he overthrew after a bloody contest. Thence he marched as lord of the country through that part of India which is now called the Punjab, establishing Greek colonies. He then wished to advance to the Ganges, but the general murmuring of his troops obliged him, at the Hyphasis (modern Sutledge), to commence his retreat, which was accomplished under circumstances of extreme danger. When he had again reached the Hydaspes, he built a fleet, and sent one division of his army in it down the river, while the other followed along the banks, fighting its way through successive Indian armies. At length, having reached the ocean, he ordered Nearchus, the commander of the fleet, to sail thence to the Persian gulf, while he himself struck inland with one division of his army, in order to return home through Gedrosia (now Beloochistan). Here he had to traverse immense deserts, where a great part of his army perished for want of food and water, and were buried in the sand. The other division marched through Arachosia and Drangiana (Afghanistan) under Craterus, but they united again in Carmania. Of all the troops, however, which had set out with A., only about a fourth part arrived with him in Persia (325 B.C.). At Susa he married Stateira, the daughter of Darius, and he bestowed presents on those Macedonians (about 10,000 in number) who had married Persian women, his design being to unite the two nations as closely as possible. He also distributed liberal rewards among his soldiers. At Opis on the Tigris he declared it to be his intention to send home the invalids richly rewarded; and this he accomplished, but not till he had with some difficulty repressed the mutiny which broke out on the occasion. Soon afterwards he was deprived, by death, of his favorite Hephestion, on which occasion his grief was unbounded, and he interred the deceased with kingly honors. As he was returning from Ecbatana to Babylon, it is said that the Magi foretold that the latter city would prove fatal to him; but A. despised their warnings, and, in spite of the advice of his friends, marched to Babylon, before reaching which, however, he was met by ambassadors from all parts of the world—Libya, Italy, Carthage, Greece, the Scythians, Celts, and Iberians. Here he again occupied himself with gigantic plans for the future, both of conquest and civilization, when he was suddenly taken ill after a banquet, and died eleven days afterwards, on the 11th or 13th of May or June, 323 B.C., in the 32d year of his age, having reigned 12 years and 8 months. His body was deposited in a golden coffin at Alexandria, by Ptolemæus, and divine honors were paid to him, not only in Egypt, but in other countries. A. had appointed no heir to his immense dominions; but to the question of his friends: "Who should inherit them?" he replied: "The most worthy." After many disturbances, his generals recognized as kings the weak-minded Aridæus—a son of Philip by Philinna, the dancer—and A.'s posthumous son by Roxana, while they shared the provinces among themselves, under the name of satraps. Perdicas, to whom A. had, on his death-bed, delivered his ring, became guardian of the kings during their minority.

It is but right to observe that A. did something more than shed blood during his life. He diffused the language and civilization of Greece wherever victory led him, and planted Greek kingdoms in Asia, which continued to exist for some centuries. At the very time of his death, he was engaged in devising plans for the drainage of the unhealthy marshes around Babylon, and a better irrigation of the extensive plains. It is

study the *Iliad*, a revision of which he himself undertook for his use. A. was 16 years of age when his father marched against Byzantium, and left the government in his hands during his absence. Two years afterwards, he displayed singular courage at the battle of Cheronæa (338 B.C.), where he overthrew the sacred band of the Thebans. "My son," said Philip, as he embraced him after the conflict, "seek for thyself another kingdom, for that which I leave is too small for thee." The father and son quarreled, however, when the former repudiated Olympias. A. took part with his mother, and fled, to escape his father's vengeance, to Epirus; but receiving his pardon soon afterwards, he returned, and accompanied him in an expedition against the Triballi, when he saved his life on the field. Philip being appointed generalissimo of the Greeks, was preparing for a war with Persia, when he was assassinated (336 B.C.), and A., not yet 20 years of age, ascended the throne. After punishing his father's murderers, he went into the Peloponnesus, and in a general assembly of the Greeks he caused himself to be appointed to the command of the forces against Persia. On his return to Macedon, he found the Illyrians and Triballi up in arms, whereupon he marched against them, forced his way through Thrace, and was everywhere victorious. But now the Thebans had been induced, by a report of his death, to take up arms, and the Athenians, stimulated by the eloquence of Demosthenes, were preparing to join them. To prevent this coalition, A. rapidly marched against Thebes, which, refusing to surrender, was conquered and razed to the ground: 6000 of the inhabitants were slain, and 30,000 sold into slavery; the house and family of the poet Pindar alone being spared. This severity struck terror into all Greece. The Atheuians were treated with more leniency, A. only requiring of them the banishment of Charidemus, who had been most bitter in his invectives against him.

A. having appointed Antipater his deputy in Europe, now prepared to prosecute the war with Persia. He crossed the Hellespont in the spring of 334 B.C., with 30,000 foot and 5000 horse, attacked the Persian satraps at the river Granicus, and gained a complete victory, overthrowing the son-in-law of Darius with his own lance. The only real resistance the Macedonians met with was from the Greek auxiliaries of the Persians, who were marshaled in phalanxes, under the command of Memnon of Rhodes, but finally they were all slain except 2000, who were taken prisoners. A. celebrated the obsequies of his fallen warriors in a splendid manner, and bestowed many privileges on their relations. Most of the cities of Asia Minor, Sardis not excepted, opened their gates to the conqueror, nor did Miletus or Halicarnassus offer longer resistance. The marvelous successes of A. now began to dazzle his own judgment, and to inflame his passions. He became a slave to debauchery, and his caprices were as cruel as they were ungrateful. In a fit of drunkenness, and at the instigation of Thais, an Athenian courtesan, he set fire to Persepolis, the wonder of the world, and reduced it to a heap of ashes; then, ashamed of the deed, he set out with his cavalry to pursue Darius. Learning that Bessus, the satrap of Bactriana, held the king a prisoner, he hastened his march, in the hope of saving him, but he found him mortally wounded on the frontiers of that country (330 B.C.). He mourned over his unfortunate enemy, and caused his body to be buried with all the usual rites observed in Persia; but he pursued Bessus, who himself aspired to the throne, through Hyrcania, Iran, Bactriana, over the Oxus to Sogdiana (now Bokhara), whose satrap, Spitamenes, surrendered Bessus to him. Having discovered a conspiracy in which the son of Parmenio was implicated, he put both father and son to death, though Parmenio himself was innocent of all knowledge of the affair. This cruel injustice excited universal displeasure. In 329 he penetrated to the furthest known limits of northern Asia, and overthrew the Scythians on the banks of the Jaxartes. In the following year, he subdued the whole of Sogdiana, and married Roxana, whom he had taken prisoner. She was the daughter of Oxyartes, one of the enemy's captains, and was said to be the handsomest of the virgins of Asia. A new conspiracy broke out against A., at the head of which were Hermolaus and Callisthenes, a pupil of Aristotle, which occasioned the death of many of the culprits; while Callisthenes himself was mutilated, and carried about in an iron cage through the army, till some one put an end to his sufferings by poison.

In the year 327 B.C., A. proceeded to the conquest of India, then known only by name. He crossed the Indus near to the modern Attock, and pursued his way under the guidance of a native prince to the Hydaspes (modern Jelum), where he was opposed by Porus, another native prince, whom he overthrew after a bloody contest. Thence he marched as lord of the country through that part of India which is now called the Punjab, establishing Greek colonies. He then wished to advance to the Ganges, but the general murmuring of his troops obliged him, at the Hyphasis (modern Sutledge), to commence his retreat, which was accomplished under circumstances of extreme danger. When he had again reached the Hydaspes, he built a fleet, and sent one division of his army in it down the river, while the other followed along the banks, fighting its way through successive Indian armies. At length, having reached the ocean, he ordered Nearchus, the commander of the fleet, to sail thence to the Persian gulf, while he himself struck inland with one division of his army, in order to return home through Gedrosia (now Beloochistan). Here he had to traverse immense deserts, where a great part of his army perished for want of food and water, and were buried in the sand. The other division marched through Arachosia and Drangiana (Afghanistan) under Craterus, but they united again in Carmania. Of all the troops, however, which had set out with A., only about a fourth part arrived with him in Persia (325 B.C.). At Susa he married Stateira, the daughter of Darius, and he bestowed presents on those Macedonians (about 10,000 in number) who had married Persian women, his design being to unite the two nations as closely as possible. He also distributed liberal rewards among his soldiers. At Opis on the Tigris he declared it to be his intention to send home the invalids richly rewarded; and this he accomplished, but not till he had with some difficulty repressed the mutiny which broke out on the occasion. Soon afterwards he was deprived, by death, of his favorite Hephestion, on which occasion his grief was unbounded, and he interred the deceased with kingly honors. As he was returning from Ecbatana to Babylon, it is said that the Magi foretold that the latter city would prove fatal to him; but A. despised their warnings, and, in spite of the advice of his friends, marched to Babylon, before reaching which, however, he was met by ambassadors from all parts of the world—Libya, Italy, Carthage, Greece, the Scythians, Celts, and Iberians. Here he again occupied himself with gigantic plans for the future, both of conquest and civilization, when he was suddenly taken ill after a banquet, and died eleven days afterwards, on the 11th or 13th of May or June, 323 B.C., in the 32d year of his age, having reigned 12 years and 8 months. His body was deposited in a golden coffin at Alexandria, by Ptolemaeus, and divine honors were paid to him, not only in Egypt, but in other countries. A. had appointed no heir to his immense dominions; but to the question of his friends: "Who should inherit them?" he replied: "The most worthy." After many disturbances, his generals recognized as kings the weak-minded Aridaeus—a son of Philip by Philinna, the dancer—and A.'s posthumous son by Roxana, while they shared the provinces among themselves, under the name of satraps. Perdikkas, to whom A. had, on his death-bed, delivered his ring, became guardian of the kings during their minority.

It is but right to observe that A. did something more than shed blood during his life. He diffused the language and civilization of Greece wherever victory led him, and planted Greek kingdoms in Asia, which continued to exist for some centuries. At the very time of his death, he was engaged in devising plans for the drainage of the unhealthy marshes around Babylon, and a better irrigation of the extensive plains. It is

even supposed that the fever which he caught there, rather than his famous drinking-bout, was the real cause of his death. To A. the ancient world owed a vast increase of its knowledge in geography, natural history, etc. He taught Europeans the road to India, and gave them the first glimpses of that magnificence and splendor which has dazzled and captivated their imagination for 2000 years.

ALEXANDRA, CAROLINE MARIE CHARLOTTE LOUISE JULIE, b. Dec. 1, 1844; daughter of Christian IX., king of Denmark. She married Mar. 10, 1863, Albert Edward, prince of Wales, eldest son of Victoria, queen of England, and heir to the British throne.

ALEXANDRI, or ALEKSANDRI, VASILJO (Basil), a Rouman poet and *littérateur*, was b. at Jassy, the chief city of Moldavia, in 1821. His family was of Venetian origin. After spending several years at a French boarding-school at Jassy, he was sent, in his fourteenth year, with a tutor to Paris; and in due course he obtained from the university of Paris the degree of bachelor of letters. He is said to have thereafter made trial in succession of the study of medicine and the study of law, and to have found neither of them to his liking; he certainly followed up neither, but, without qualifying himself for any profession, went back to Jassy in 1839. He found at Jassy a band of young men educated, as he himself had been, in France, whose minds had been formed upon the literature and the political ideas of France; who, besides being ambitious of literary distinction, were zealous for political equality and for Rouman nationality and independence. He naturally became the associate of these men; and, soon after his return, made his *début* in literature by contributing a story, *The Flower-Girl of Florence*, to a periodical conducted by them under the editorship of Cogalniceano. He became a frequent contributor to this periodical. Unfortunately, it was not destined to live long, being suppressed by order of prince Stourdza. It was in 1842, after a long excursion among the mountains of his native province, that he first made his appearance as a poet, publishing several pieces, most of them strongly tinged with national feeling. At this time, too, it was that he began to write the songs and ballads upon which his chief claim to literary reputation at present rests. In 1844 he suddenly attained to an almost unbounded local popularity as a play-writer. Having become concerned in the management of two theaters at Jassy, the one French, the other Moldavian, he produced a series of pieces, some in French, others in Rouman, which, though mostly slight and hasty performances, had merit enough to excite the enthusiasm of his countrymen. *Georges de Sadagoura*, *Jassy en Carnaval*, *La Pierre de la Maison*, *La Noce Villageoise*, are the titles of the most important of them. In 1844, he had also, in conjunction with Cogalniceano and prince John Ghika, set on foot a new periodical, devoted to literature and science; but this, like the one already mentioned, was not suffered to live long—it was suppressed by the government, after a career of only nine months.

A. was engaged in the revolutionary movement which took place at Jassy in the year of revolutions, 1848, and on its failure had to betake himself to Paris. There, through the press, during the short period of his exile, he labored to arouse public opinion in favor of the independence of the Roumans; and his efforts, though they were unsuccessful at the time, helped, with those of others, to prepare the way for what took place several years after. It was to the Russian war that Moldavia and Walachia were destined to owe their virtual emancipation from the yoke of Turkey, and the chance of obtaining self-government and union. The union of the two principalities was carried by the resolution of their inhabitants, backed by the support of France, in spite of political obstacles that seemed almost insurmountable; and A. did not a little to inspire the resolution of his countrymen. A song which he wrote at the critical moment in 1856, *The Hour of Union*, became exceedingly popular, and by its stirring appeals to the feeling of Roumanian nationality, helped to allay the jealousies which divided the two principalities, and to make them work together for the union. A. took a prominent part in all the political transactions which culminated in this result. It should be stated that two years earlier, when the death of his father had put him into possession of the family estate, he had emancipated the serfs who lived upon it; and that this example found so many imitators that the government found itself almost immediately compelled to decree a general measure of enfranchisement.

A.'s *Popular Ballads of Roumania*, which he had begun to compose in 1842, appeared at Jassy in two parts in 1852 and 1853. One of the parts, translated into French by himself, was afterwards published at Paris under the title of *Ballades et Chantes Populaires de la Roumanie*. His collected dramatic works were published at Jassy in 1852. Another volume of poems appeared at Paris in 1853; and of this volume a French translation, with the title, *Les Doctes Poesies Moldaves*, was soon afterwards produced by M. Vanesco. *Le Collier Littéraire*, a miscellaneous collection of pieces in prose and verse, many of which had previously appeared in periodicals, he published in 1857. A., as may be inferred from facts already stated, has written largely in periodicals, but mostly on subjects of passing interest. All his works, besides their intrinsic merits, which are very considerable, are interesting from the connection they have with the growth of a national feeling among the Roumans.

ALEXANDRIA, a co. in n.e. Virginia, on the Potomac, opposite the district of Columbia, and a part of that district until the recession in 1846; 36 sq. m.; pop. '70, 16,755

—7310 colored. The surface is hilly and the soil thin. The chief productions are corn, wheat, oats, and hay. Co. seat, Alexandria.

**ALEXANDRIA** (called Skanderi'eh by the Turks and Arabs) was founded by Alexander the great in the autumn of the year 332 B.C. It was situated originally on the low tract of land which separates the lake Mareotis from the Mediterranean, about 14 m. w. of the Canopic mouth of the Nile. Before the city, in the Mediterranean, lay the island of Pharos, upon the n.e. point of which stood the famous light-house (Pharos), and which was connected with the mainland by a mole, called, from its length, the heptastadium, or "seven furlong" mole, thus forming the two harbors. The plan of A. was designed by the architect Dinocrates, and its original extent is said to have been about 4 m. in length, with a circumference of 15 m. It was intersected by two straight main streets, crossing each other at right angles in the middle of the city. Colonnades adorned the whole length of these streets, which were in general very regularly built. The most magnificent quarter of the city was that called the Bruchetium, which was situated on the eastern harbor. This quarter of the city contained the palaces of the Ptolemies, with the museum and the old library; the soma or mausoleum of Alexander the great and of the Ptolemies, the poseidonum, and the great theater. Further w. was the emporium or exchange. The Serapeion, or temple of Serapis, stood in the western division of the city, which formed the Egyptian quarter, and was called Rhacôtis; a small town of that name had occupied the site before the foundation of A. To the w. of the city lay the great necropolis, and to the e. the race-course, beyond which was the suburb of Nicopolis. The greater part of the space under the houses was occupied by vaulted subterranean cisterns, which were capable of containing a sufficient quantity of water to supply the whole population of the city for a year. From the time of its foundation, A. was the Greek capital of Egypt. Its pop. in the time of its prosperity is said by Diodorus to have amounted to about 300,000 free citizens, and if we take into account the slaves and strangers, that number must be more than doubled. This population consisted mostly of Greeks, Jews, and Egyptians, together with settlers from all nations of the known world. After the death of Alexander the great, A. became the residence of the Ptolemies. They made it, next to Rome and Antioch, the most magnificent city of antiquity, as well as the chief seat of Grecian learning and literature, which spread hence over the greater part of the ancient world. The situation of the city, at the point of junction between the e. and w. rendered it the center of the commerce of the world, and raised it to the highest degree of prosperity.

A. had reached its greatest splendor when it came into possession of the Romans, about 30 B.C. From this moment its prosperity began to decline—at first almost imperceptibly, but afterwards more rapidly, in consequence of the removal of the works of art to Rome, the massacres of Caracalla, the laying waste of the Bruchetium by Aurelian, the siege and pillage of the city by Diocletian, and lastly the rising prosperity of the rival city of Constantinople. All these causes combined to destroy A. so speedily that in the 4th c. no building of any importance was left in it except the temple of Serapis. The strife between Christianity and heathenism gave rise to bloody contests in A. The Serapeion, the last seat of heathen theology and learning, was stormed by the Christians in 389 A.D., and converted into a Christian church. This put an end to heathenism, and A. became henceforward a chief seat of Christian theology, and continued to be so till it was taken by the Arabs, under Amru, in June, 638 A.D. This siege, and still more its conquest by the Turks in 868 A.D., completed the destruction of the city. It revived, indeed, in some degree under the Egyptian caliphs, and continued during the middle ages to be the most important emporium of trade between the east and west; but the discovery of America, and of the passage to India by the cape of Good Hope, very much diminished the trade of A.; and the dominion of the Mamelukes, and the conquest of Osmanli, annihilated even the little which the Arabs had restored. The result was that in 1778 A.D., A. contained no more than 6000 inhabitants. After the conquest of Egypt by the French in the end of the 18th c., A. once more began to revive; and under Mehemet Ali, who resided in it a part of every year, it prospered to such a degree that it may now be reckoned one of the most important commercial places on the Mediterranean. It is specially important as the center of steam-communication between Europe and India.

The present city is not situated exactly on the site of the old one, but is chiefly built on the mole called the heptastadium, which has been increased by alluvial deposits till it has become a broad neck of land between the two harbors, of which the eastern is called the new port, and the western the old port. A. is connected with Cairo by rail (continued to Suez) and by the canal of Mahmoudieh. Although originally, like other oriental cities, dirty and ill-built, it is in this respect rapidly improving. In 1871, 4068 vessels, of 2,524,983 tons, entered and cleared. In 1870, the population was 238,888—Arabians, Turks, Jews, Copts, Greeks, and Franks. Of the few remains of antiquity still to be seen in A., the most prominent is Pompey's pillar, as it is erroneously called, the shaft of which, of red granite, is 73 ft. long. According to the Greek inscription on the base, which is still legible, this pillar was erected by the Egyptian prefect Publius, in honor of the emperor Diocletian. There are also the so-called Cleopatra's needles, two obelisks of the time of King Thothmes III., who lived in the 18th c. B.C. One of the needles, a monolith 72 feet high, is still standing; the other was brought to England

and erected on the Thames embankment in 1878. The other antiquities of A. are some catacombs of the ancient city of the dead, and some of the cisterns below the city, which are almost entirely filled up.

**ALEXANDRIA**, a port of entry on the right or Virginian bank of the Potomac, United States, about 7 m. below Washington, on the opposite side of the river, lat. 38° 49' n., long. 77° 4' w. Though A. is fully 100 m. from the entrance of the Potomac into Chesapeake bay, yet the stream in front of it, which forms its harbor, is still a mile wide. The place is accessible, all the way from the sea, to the largest vessels. In this commanding position with respect to the coast, A. has, since 1852, facilitated its communications with the interior, being connected by a branch canal with the Chesapeake and Ohio, and by a branch railway with the Virginia Central. Railways have also been opened to Leesburg and Washington. Owing to these combined advantages the trade of the city is steadily increasing, while cotton manufactures also have been introduced on an extensive scale. The value of its import and export trade amounts to about \$80,000. Pop. in '80, 13,655.

**ALEXANDRIA**, a t. of Dumbartonshire, Scotland, on the w. bank of the Leven, opposite to Bonhill, 3 m. from Dumbarton, on the Glasgow, Dumbarton, and Vale of Leven railway. It is a t. of recent growth, of a neat and pleasing appearance, in the midst of beautiful scenery. It has extensive cotton-printing works, and other public works. Pop. '71, 4650.

**ALEXANDRIA**, a village and township in Jefferson co., N. Y., on the St. Lawrence river, 25 m. n.e. of Watertown. The village is a port for steamboats, and has a light-house, glass factories, and a number of churches. The Thousand Islands (numbering really more than a thousand) are a little below in the St. Lawrence, and are among the most beautiful and popular resorts in America. Many of these islands are occupied by private owners who have elegant villas and cottages, and the whole series, not long ago almost unvisited, is a grand natural and artificial park. Pop. township, '75, 3472.

**ALEXANDRIAN CODEX**, an important manuscript of the sacred Scriptures in Greek, now in the British museum. It is written on parchment, in finely formed uncial letters, and is without accents, marks of aspiration, or spaces between the words. Its probable date is the latter half of the 6th century. With the exception of a few gaps, it contains the whole Bible in Greek (the Old Testament being in the translation of the Septuagint), along with the epistles of Clemens Romanus. For purposes of biblical criticism, the text of the epistles of the New Testament is the most valuable part, for with respect to the gospels, it is clear that the original text which the copyist had before him must have been far inferior. This celebrated manuscript belonged, as early as 1098, to the library of the patriarch of Alexandria. In 1628 it was sent as a present to Charles I. of England, by Cyrilus Lucaris, patriarch of Constantinople, who declared that he had got it from Egypt; and that it was written there appears from internal and external evidence. Grahe made this manuscript the foundation of his edition of the Septuagint (4 vols., Oxf. 1717-1720). Fac-similes have been published of the New Testament, by Woide (Lond. 1786), and by Cowper (Lond. 1830); of the Old Testament, by Baber (Lond. 1816).

**ALEXANDRIAN LIBRARY**. This remarkable collection of books, the largest of the ancient world, was founded by Ptolemy Soter, in the city of Alexandria, in Egypt. Even in the time of its first manager, Demetrius Phalereus, a banished Athenian, the number of volumes or rolls already amounted to 50,000; and during its most flourishing period, under the direction of Zenodotus, Aristarchus of Byzantium, Apollonius Rhodius and others, is said to have contained 400,000, or, according to another authority, 700,000. The greater part of this library, which embraced the collected literature of Rome, Greece, India, and Egypt, was contained in the museum, in the quarter of Alexandria called Bruchesium. During the siege of Alexandria by Julius Caesar, this part of the library was destroyed by fire; but it was afterwards replaced by the collection of Pergamos, which was presented to queen Cleopatra by Mark Antony, to the great annoyance of the educated Romans. The other part of the library was kept in the Serapeion, the temple of Jupiter Serapis, where it remained till the time of Theodosius the great. When this emperor permitted all the heathen temples in the Roman empire to be destroyed, the magnificent temple of Jupiter Serapis was not spared. A mob of fanatic Christians, led on by the archbishop Theophilus, stormed and destroyed the temple, together, it is most likely, with the greater part of its literary treasures, in 391 A.D. It was at this time that the destruction of the library was begun, and not at the taking of Alexandria by the Arabians, under the caliph Omar. The story, at least, is ridiculously exaggerated which relates that the Arabs found a sufficient number of books remaining to heat the baths of the city for six months. The historian Orosius, who visited the place after the destruction of the temple by the Christians, relates that he then saw only the empty shelves of the library. See Petit-Radel, *Recherches sur les Bibliothèques Anciennes et Modernes* (Paris, 1819); and Ritschl, *Die Alexandrinischen Bibliotheken* (Berlin, 1838).

**ALEXANDRINE AGE**. After liberty and intellectual cultivation had declined in Greece, Alexandria in Egypt became the home and center of science and literature. The time in which it held this position is styled the A. A., and may be divided into two periods: the first including the reigns of the Ptolemies, from 323 to 30 B.C.; the second from 30 B.C. to 640 A.D., or from the fall of the Ptolemaean dynasty to the irruption of the Arabs.

Ptolemæus Soter, the first ruler who introduced and patronized Greek science and literature in Alexandria, was followed by that yet more munificent patron, Ptolemæus Philadelphus, who regularly established the celebrated Alexandrian library and museum, which had been probably begun by his father. This museum contained porticos, a lecture-room, and a large hall, in which the learned men—the professors and fellows, as they might be called—dined together. The A. school consisted of Egyptians, Greeks, Jews, and latterly, Romans. The grammarians and poets made the greatest figure. The grammarians were both philologists and *littérateurs*, who explained things as well as words, and were thus a kind of encyclopædists. Among these rank Zenodotus of Ephesus, Eratosthenes of Cyrene, Aristophanes of Byzantium, Aristarchus of Samothrace, Crates of Mallus, Dionysius the Thracian, Apollonius the sophist, and Zoilus. Their chief service consists in having collected the writings then existing, prepared corrected texts, and preserved them for future generations. The most noted of the poets of the A. school were Apollonius Rhodius, Lycophron, Aratus, Nicander, Euphorion, Callimachus, Theocritus, Dionysius, and the seven tragedians called the A. Pleiades.

The A. school has a spirit and character altogether different from the previous intellectual life of Greece. From the attention paid to the study of language, it was natural that correctness, purity, and elegance of expression should become especially cultivated; and in these respects many of the A. writers are distinguished. But what no study and no efforts could give—the spirit, namely, that animated the earlier Greek poetry, was, in most of these works, wanting. In place of it, there was displayed greater art in composition; what had formerly been done by genius, was now to be done by the rules furnished by criticism. Only a few display real genius; the works of the rest, faultless according to rule, are destitute of life and soul. In a school, where imitation and rule thus took the place of inspiration, each generation of disciples became more artificial and lifeless than their masters. Criticism degenerated into frivolous fault-finding, and both prose and poetry became labored affectation.

The ALEXANDRINE PHILOSOPHY is characterized by a blending of the philosophies of the east and of the west, and by a general tendency to *eclecticism*, as it is called, or an endeavor to reconcile conflicting systems of speculation, by bringing together what seemed true in each. Not that the A. philosophers were without their sects; the most famous of which were the Neo-Platonists (q.v.). Uniting the religious notions of the east with Greek dialectics, they represent the struggle of ancient civilization with Christianity; and thus their system was not without influence on the form that Christian dogmas took in Egypt. The amalgamation of eastern ideas with Christian, gave rise to the system of the Gnostics (q.v.), which was elaborated chiefly in Alexandria.—The A. school was no less distinguished for the culture of the mathematical and physical sciences, which here reached a greater height than anywhere else in ancient times. As early as the 3d c. B.C., Euclid had here written his great work on geometry. The astronomers of the A. school were distinguished from all their predecessors by their setting aside all metaphysical speculation, and devoting themselves to strict observation. Among the distinguished physicists and mathematicians of the A. school were Archimedes, Eratosthenes, Aristarchus of Samos, Ptolemæus, etc. For about 4 c. the A. school was the center of learning and science in the ancient world. Counting from its origin to its complete extinction, it lasted 1000 years.

ALEXANDRINES are rhyming verses consisting each of 12 syllables or 6 measures. The name is most probably derived from an old French poem on Alexander the great, belonging to the 12th or 13th c., in which this measure was first used; according to others, it was so called from the name of one of the authors of that poem being Alexander. The A. has become the regular epic or heroic verse of the French, among whom each line is divided in the middle into two hemistichs, the sixth syllable always ending a word. In English, this rule is not always observed, as in the following verse from Spenser:

That all the woods shall answer, and their echo ring.

The only considerable English poem wholly written in A. is Drayton's *Polyolbion*; but the Spenserian stanza regularly ends in an Alexandrine, and the measure occurs occasionally in our common heroic verse, as the last line of a couplet:

When both are full, they feed our blest abode.  
Like those that watered once the paradise of God.—Dryden.

ALEXANDROPOL, or GOOMRI, a fortified t. in the Caucasus, 85 m. s.w. of Tiflis, an important strategic point commanding the entrance to Armenia. The fort is 300 ft. above the town level, and is large and strong.

ALEXANDROVSK, a t. in the s. of Russia, capital of the district of the same name situated on the left bank of the Dnieper, below the cataracts. It is 48 m. s. of Ekaterinoslav, is fortified, and has considerable trade. Inland productions are shipped here for the Black sea. Pop. '67, 4601.—There are various other towns and districts of the same name in Russia; the most important of which is that in the government of Vladimir, in the center of the empire. It was a favorite summer residence of the czar Ivan Vasilievitch, who introduced there the first printing-press known in Russia. It has also a magnificent imperial *stud*, commenced by the empress Elizabeth in 1761, and completed about 20 years after. Pop. '67, 5810.

ALEXEI, ALEXANDROVITCH, 3d son of the emperor of Russia, b. Jan. 2, 1850. In 1872, he traveled through the United States, meeting a very kind reception. He is a grand duke, admiral, major-general, etc.

ALEXEI MICHAÏLOWITCH, the 2d Russian czar of the house of Romanow (b. March 10, 1629—d. Jan. 29, 1676), succeeded his father, Michael Fedorowitch, in 1645. The young czar A., yielding himself to the control of his chancellor, Plessow, and his tutor, Morosow, the avarice of these bad advisers caused an insurrection in 1648, in which Plessow lost his life. Popular discontent favored the plans of two pretenders to the throne—Demetrius III. (q.v.) and Ankudinow. The latter, professing to be a son of the czar Wasili Shuiskoi, was executed at Moscow in 1658. A. possessed good qualities, which appeared when he came to riper years. In his two campaigns against the Poles (1654–1656, and 1660–1667), he took Smolensko, conquered and devastated almost the whole of Lithuania, and even secured for himself the possession of several provinces. He also gained a part of the Ukraine; and though his war with Sweden (1656–1658) was unfortunate, he lost nothing by the following peace. A. conferred great benefits on his countrymen, by the introduction of various important reforms into the Russian laws; he ordered translations of numerous scientific works, chiefly of a military nature, into Russian; and even ventured on some ecclesiastical changes. In his private character, he was amiable, temperate, and pious. His second wife, the beautiful Natalia Narischkin, was the mother of Peter the great.

ALEXEI, PETROWITCH. The eldest son of Peter the Great of Russia, was b. at Moscow, Feb. 18, 1690. Having shown himself opposed to the reforms and innovations made by the emperor, he was excluded by Peter from the line of succession to the throne. With this decision he appeared to be satisfied, and declared his intention of spending the remainder of his days in a monastery. But when Peter the Great undertook his second tour in northern Europe, A., under the pretence of following the czar, escaped in 1717 to Vienna, and thence went to Naples. He was induced to return to Russia, where, by the ukase of Feb. 2, 1718, he was disinherited, and an investigation was ordered to detect all parties concerned in his recent flight from Russia. His mother, Eudoxia, with Marie Alexiewna, step-sister to the czar, and several other eminent persons, were made prisoners, and either executed or otherwise punished. A. was condemned to death, but soon afterwards received a pardon. However, the terror and agitation of the trial so affected his health, that he d. June 26, 1718. The czar, to avoid scandal, ordered the trial to be published. Other accounts assert that A. was beheaded in prison. By his wife, Charlotte Christine Sophie, princess of Brunswick-Wolfenbüttel, A. left a son, who, as Peter II., was elevated to the throne.

ALEXIS. See ALEXEI, *ante*.

ALEXIUS COMNENUS, one of the ablest rulers of the Byzantine empire, was b. at Constantinople in 1048. He was the third son of Johannes Comnenus, the brother of the emperor, Isaac Comnenus. The family came originally from Italy, and settled in Asia Minor. His father having refused the purple on the abdication of Isaac, it was given to one Ducas, the son of a distinguished general. A. in his youth gave brilliant promise of the vigorous military genius which he afterwards manifested; and at length, after a series of anarchic reigns of brief duration, his soldiers succeeded in elevating him to the throne, while the old and feeble Nicephorus Botaniates, his predecessor, was obliged to retire to a monastery. Gibbon graphically paints the position and achievements of A. in the 48th chapter of his *Decline and Fall of the Roman Empire*. Everywhere he was encompassed with foes. The Scythians and Turks were pouring down from the north and north-east; the fierce Normans, who had violently effected a lodgment in Sicily and Italy, were menacing his western provinces; and, finally, the myriad warriors of the first crusade had burst into his empire on their way to Palestine, and had encamped around the gates of his capital. Yet he contrived to avoid all perils and disgraces by the wisdom of his policy, the mingled patience and promptitude of his character, his discipline in the camp, and his humanity on the throne. He reigned for 37 years; and if it had been possible to preserve the weak and corrupt Byzantine empire in its integrity, a ruler like A. might have done it. He could only delay its inevitable destruction. Undoubtedly, the great interest which attaches to A. arises from his relation to the crusaders. Historians differ as to the purity and sincerity of his conduct towards them. His daughter Anna, who wrote his life, defends his "policy" with filial piety; but it seems clear that he entertained a profound dread and suspicion of the half-civilized Franks, and, knowing the weakness of his own empire, was compelled to dissimulate. He certainly promised them help, and persuaded them to go off into Asia; it is equally certain that he did not fulfill his promises, and that he simply used them as instruments to reconquer from the Turks the islands and coasts of Asia Minor. Perhaps, however, little apology is needed for a monarch who "subdued the envy of his equals, restored the laws of public and private order, caused the arts of wealth and science to be cultivated, and transmitted the scepter to his children of the third and fourth generation." He died in 1118.

AL-FARABI, ABU NASR MUHAMMED IBN TARKHAN, one of the earliest of Arabian philosophers, living in the 10th century. He was court physician, and a student of

medicine and philosophy. He enumerates six orders of science: 1. language or grammar; 2. logic; 3. mathematics, embracing geometry, arithmetic, optics, the science of the stars, music, and weights and measures, the star science including astronomy, chronicles, astrology, dreams and auguries; 4. natural science; 5. civil science, including jurisprudence and rhetoric; 6. divine science, or metaphysics. This remarkably approximates the modern classification. He assumes that there must be some supreme necessary existence to account for the existences which we perceive as actual; and this supreme necessary existence has infinite life, wisdom, power, and goodness, but is an absolute unity without distinguishing attributes.

ALFHEIMR, in Norse mythology, the palace or home of Frey, the land of the elves of light or fairyland. It was presented by the gods to Frey as a "tooth gift," that is, when the young god had cut his first tooth.

ALFIERI, VITTORIO, COUNT, a modern Italian dramatic poet, was b. at Asti, in Piedmont, on the 17th Jan., 1749. He received a very defective education in his father's house, and was then sent to the academy of Turin, which he quitted, as ignorant and uninformed as he had entered it, to join a provincial regiment. After a hurried tour through the greater part of Europe, he returned to Turin in 1772. He then left the military service, and renouncing idleness and unworthy amours, devoted himself to literary occupation. The applause which his first attempts received, encouraged him in his determination to win fame as a dramatic author. But as he clearly saw the deficiencies of his education, he began at a mature age to learn Latin, and also to study the Tuscan dialect, for which purpose he went to Tuscany. On his journey thither, A. made the acquaintance of the countess of Albany (q.v.), to whom he became deeply attached. To render himself worthy of her esteem, he strove with unremitting earnestness after poetic excellence; and in order to be perfectly free and independent of all other cares, he transferred his whole property to his sister, in exchange for an annuity. A. now lived alternately in Florence and in Rome. Afterwards, when his friend the countess was released from other ties by the death of her husband, they lived together in the closest intimacy in Alsace or in Paris, where A. was incessantly occupied in writing, revising, and publishing his works. There appears to have been a marriage, although it was never made public. On the first outburst of the French revolution, A. went to England, but soon returned to Paris. In 1792 he was again forced to flee from France, and he then settled with his inseparable companion in Florence. Here he d., on the 8th Oct., 1803. The ashes of A. and those of his friend repose in the church of Santa Croce, in Florence, under a beautiful monument by Canova, between the tombs of Michael Angelo and Macchiavelli. As a dramatic author, A. has attempted three different departments of his art. He published 21 tragedies, 6 comedies, and 1 "tramelogedia," a name invented by himself. His dramatic works show a want of fresh imaginative vigor, and betray the laborious perseverance with which he did violence both to himself and to art. A. was inspired more by politics than by poetry. He wished to breathe a spirit of freedom into the dormant minds of his countrymen, and considered the theater as a school in which the people might learn to be "free, strong, and noble." In order to preserve the purity of his muse, A. had resolved to read no other poet. He wished to produce an effect by the very simplest means, and, renouncing the aid of ornament, to please by manly strength and earnestness alone. His works are on this account cold and stiff, his plots simple even to poverty, his verse hard and unpleasing, and his language destitute of that magic splendor of coloring which stirs the inmost soul. Notwithstanding this, A. did good service to Italian tragedy. He corrected the effeminate taste which had before prevailed, as well as the pedantry of an affected imitation of Attic models. Succeeding writers endeavored to imitate his strength and simplicity. A. was more unsuccessful in his comedies than in his tragedies. They manifest the same serious political tendency; the invention is poor, the development of the plot uninteresting, and the characters are only general sketches, without individuality. The most successful of his dramatic works is *Abel*, a mixture of tragedy and opera, invented by himself, which he designated by the singular name of "tramelogedia." Besides the dramatic works of A., we possess an epic poem, in four cantos, written by him, also many lyrical poems, 16 satires, and poetical translations of Terence, Virgil, and portions of Aeschylus, Sophocles, Euripides, and Aristophanes. After his death, appeared his *Misogallo*, a memorial of his hatred to the French. The countess of Albany had a collected edition of his works published (35 vols 4to, Pisa, 1805-1815) containing his autobiography; Centofanti published *Tragedie e Vita d'Alfieri* (Florence, 1842).

ALFON'SINE, a t. of Italy, in the prov. of Ravenna, nearly 4 m. n.w. from Ravenna, in a level, irrigated, and fertile district. Pop. of commune, 6741.

ALFON'SINE, or ALPHONSINE TABLES, certain astronomical calculations made by the ablest men of the period for Alphonso of Castile (1221-84). A room in the palace at Segovia is still shown as Alphonso's observatory. The tables were compiled in 1252, the year that A. came to the throne, and first published in 1483.

ALFONSO I., of Navarre and Aragon, succeeded Pedro I. in 1104. He united Castile to his kingdom by marrying the daughter and heiress of Alphonso VI. of Leon and Castile, and thereupon assumed the title of "Emperor of all Spain." A. was surnamed

"the fighter," and his victories were mainly over the Moors. In 1118 he took Saragossa after a siege of three years. In 1120, he slew 20,000 Moors on the field of Daroca. In 1123, he invaded Valencia, and two years later he went to the aid of the Christian Moors in Granada. In 1130, he crossed the Pyrenees and captured Bordeaux and Bayonne. He d. in 1134.

**ALFONSO V.**, King of Aragon, Naples, and Sicily (1416-58 A.D.), received the surname of "the magnanimous," because on his accession to the throne he destroyed a document containing the names of all the grandees who were hostile to him. His historical importance arises from his having brought southern Italy under the dominion of Aragon. In 1420, he attacked Corsica, but speedily hastened to Naples, at the request of queen Joanna II., who besought his assistance against Louis of Anjou. For some time he enjoyed the highest favor; but in 1423, having thrown into prison her minion Caraccioli, who was his enemy, the queen declared for his rival, Louis. At her death, in 1435, A. resolved to claim the kingdom; but René of Anjou, whom Joanna had appointed her successor after the death of Louis, opposed him. Rome and Genoa sided with René, and the Genoese fleet attacked and defeated that of A., the monarch himself being taken prisoner. He was sent to duke Philip of Milan, who, charmed by his manner and talent, set him at liberty, and even formed an alliance with him. After several battles, and a long mountain-war in the Abruzzi, A. overthrew his adversary, and entered Naples in triumph. Having once firmly established his power, he proceeded to suppress the disorders which had sprung up during the worthless reign of Joanna, and honorably distinguished himself by his patronage of letters. He d. at Naples while his troops were besieging Genoa, June 27, 1458.

**ALFONSO I.**, of CASTILE (VI. of Leon), 1030-1109; surnamed "the valiant." Leon was given to him by his father, while Sancho, the eldest son, received Castile; and García, youngest of the three, was given a part of Galicia and Portugal. War soon began among them, and in 1068 Sancho defeated A. in a bloody battle on the Pisurga. Three years later A. defeated Sancho on the Carrion; but during the night Sancho was reinforced, it is said, by the renowned Cid, Roderigo Diaz de Bivar, nearly exterminated the Leonese army, took A. prisoner, compelled him to abdicate, and shut him up in a monastery. A. escaped and sought shelter with the Moorish king of Toledo. Sancho took possession of Leon and immediately went against García, defeating and capturing him at Santarem. In 1073, Sancho was secretly killed, and A., upon solemnly declaring himself innocent of the murder, was reinstated in his kingdom of Leon, to which was added Castile. His brother García, who was preparing to recover the throne of Galicia, was treacherously invited to A.'s court, made a prisoner, and ten years afterwards died in confinement. A. now ruled over nearly all of his father's kingdom, and went to the assistance of the Moorish king who had befriended him, and whose kingdom was invaded by the Cordoyans. A.'s gratitude ended with the death of the old king; he did not scruple to attack the son, and soon captured the city of Toledo. A. was monarch of nearly the whole of Spain, when a powerful Almoravide army from Africa, with the assistance of the king of Seville, gave him a terrible defeat, in 1086, near Zalaca. He recovered after a time, but in 1108 the Moors destroyed his army and killed his only son. The next year A. died, and was succeeded by his daughter Urraca, who became the wife of Alfonso I. of Aragon. By an illegitimate daughter A. became an ancestor of the king of Portugal.

**ALFONSO III.**, surnamed THE GREAT, King of Leon, Asturias, and Galicia, b. 848 A.D. He succeeded his father, Ordoño I., in 866, but had to maintain his rights by force of arms against count Froila, who had usurped the throne. Having caused the latter to be murdered, he proceeded sternly to reduce to obedience the powerful nobility of the kingdom, who looked with a jealous eye on the monarchy remaining in one family; and then, carrying his arms against other enemies, he fought through more than 30 campaigns, and gained numerous victories over the Moors. He crossed the Douro, broke down the walls of Coimbra, penetrated to the Tagus and Estramadura, enlarged his territories by a portion of Portugal and old Castile, and repeopled the conquered and desolated Burgos. But these wars entailed great expense and misery on the nation. In 888, A. had to endure the pain of beholding, at the head of a rebel army, his own son García, who wished to seize the crown, although pretending a simple desire for the prosperity of the commonwealth. A. collected his forces, conquered his son, and threw him into prison. But García's mother, by the help of several of the grandees, excited a new conspiracy, which resulted in the abdication of the monarch in favor of his imprisoned son. In order, however, to be still useful to his country, A. became commander of García's forces in an expedition against the Moors. After returning in triumph, he d. at Zamora, 910.

**ALFONSO VI.**, of LEON. See ALFONSO I., of Castile.

**ALFONSO X.**, surnamed "the astronomer," "the philosopher," or "the wise" (*el sabio*), king of Leon and Castile, b. 1221, succeeded his father, Ferdinand III., in 1252. As early as the storming of Seville in 1248, he had given indications of his courageous spirit. But, instead of wisely attempting to expel the Moors and subdue the nobility, he lavished the resources of his kingdom in fruitless efforts to secure his election to the

imperial throne of Germany. Rudolph of Hapsburg was chosen in opposition to him. Nor would pope Gregory X. recognize his claims even to the duchy of Swabia. Soon after, his throne was threatened by the turbulence of the nobility and his wars with the Moors. The latter, however, he defeated in 1263, in a bloody battle, and took from them Xeres, Medina-Sidonia, San-Lucar, and a part of Algarve, uniting at the same time Murcia with Castile. In 1271, an insurrection broke out in his dominions, at the head of which was his son Philip. Three years elapsed before it was finally quelled. In the mildness with which he treated the rebels, men saw only indications of his weakness. But afterwards determining to employ more stringent measures, his son Sancho also rebelled, and in 1283 deprived him of his throne. He now sought the help of the Moors, but after fruitless efforts to recover his power, he died at Seville, April 4, 1284. He was the most learned prince of his time, and has acquired lasting fame through the completion of the code of laws commenced (though this is disputed) by his father, and called *Leyes de las Partidas*, which in 1501 became the universal law of the land. There are still extant several long poems of his, besides a work on chemistry, and another on philosophy. He is also credited with a history of the church and of the crusades, and is said to have ordered a translation of the Bible into Spanish. He labored much to revive knowledge, increasing both the privileges and professorships of the university of Salamanca. He sought to improve the Ptolemaic planetary tables, whose anomalies had struck observers even at that early time. For this purpose, in 1240, he assembled at Toledo upwards of 50 of the most celebrated astronomers of that age. His improved tables, still known under the name of the Alfonsine tables, were completed in 1252 at the cost of 40,000 ducats—an unprecedented sum to be expended on such a work in those days. The results obtained by means of the Alfonsine tables were no more accurate than those of the older ones, for both were based on the same erroneous hypothesis of Epicycles (q.v.). The *Opusculos Legales* of A. were published by the royal historical society of Madrid in 1836.

ALFONSO I., of NAPLES and SICILY. See ALFONSO V., of Aragon, *ante*.

ALFONSO I., earliest king of Portugal, was the son of Henry of Burgundy, conqueror and count of Portugal. He was born in 1110 A. D., and being only 2 years of age at his father's death, the management of affairs fell into the hands of his ambitious and dissolute mother, Theresa of Castile, from whom he was compelled forcibly to seize it on attaining his majority. He then entered on a war with Castile, whose supremacy he did not recognize, and, league himself with Navarre, made several conquests in Galicia, after which he proceeded to attack the Moors, whose invasions he had already begun to check by building the fortress of Leiria. A battle was fought in the plains of Ourique, July 25, 1139, when victory declared for the Portuguese, after a bloody struggle, in which, it is said, not less than 200,000 Moors perished. From that day, A. assumed the title of king, which the pope confirmed. On the 25th of Oct., 1147, he took Lisbon, by the help of the English fleet of crusaders; and in 1158, after a siege of 2 months, made himself master of Alcazar-de-Sul and Evora. In 1171, he took by assault the fortress of Santarem from the Saracens, and annihilated the garrison; and at the same place he defeated the Almohadian ruler, Jusuf-ben-Jakub, in 1181. He invited to his land the knights-templars and knights of St. John, and established the orders of Avis and of St. Michael. The Portuguese style him *el conquistador* (the conqueror). But he was also a legislator, establishing the cortes of Lamego, and promulgating a code of laws relating to the order of succession, the privileges of the nobility, the administration of justice, etc. He died at Coimbra, Dec. 6, 1185.

ALFONSO V., of PORTUGAL, 1432-81; surnamed "Africano," in honor of his victories over the Moors in Algiers. He succeeded his father in 1438, but did not govern until 1448, his uncle being regent in the meantime. A. declared this uncle to be a rebel, and defeated him in a battle in which he was slain. After a campaign in Africa, A. undertook to seize upon Castile and Leon, but was defeated at Toro. A. tried to get assistance from the king of France, but found that monarch deceiving him, and abdicated in favor of his son Juan. The son refused, and A. reigned two years longer, when he fell into a deep melancholy and retired to a monastery, where he died.

ALFONSO VI., King of Portugal, second son of John IV., was at first destined for the church, but the death of his elder brother in 1656 altogether changed his circumstances. Being then a minor, the government of the kingdom was intrusted to his mother, Louisa de Guzman, a woman of great wisdom and prudence, who felt it her duty to retain the power in her own hands, even after A. had reached his majority; for the sickly and dissolute prince displayed little aptitude for business. But the court minions, who had their own reasons for wishing him to rule, urged him to remove his mother from her office. This was accomplished in 1662. The minister, count Castel-Melhor, a mere trifler, possessed supreme authority. Nevertheless, Portugal was victorious in the war which she undertook against Spain, although for this she had to thank her English and French allies. In 1666, A. married Maria-Francisca-Elizabeth of Savoy, who, however, soon conspired with his brother Pedro against him. The plot succeeded. A. was seized and imprisoned at Cintra, where he died on the 12th of Sept., 1683. Pedro then obtained the throne, and married the widow of his deceased brother.

ALFORD, REV. HENRY, D.D., a biblical critic of the highest reputation, and also a poet of considerable genius, was born in London in 1810, but was educated first at Ilminster grammar-school in Somersetshire, and finally at Trinity college, Cambridge, where he took his degree, and entered the church. His first volume, published at Cambridge in 1831, was entitled *Poems and Political Fragments*. Three years afterwards, the young author was elected a fellow of Trinity, and in the following year, 1835, appeared his most popular work, *The School of the Heart, and other Poems*, which has been frequently reissued, especially in America. About the same time A. was appointed vicar of Wymeswold, Leicestershire, where he remained till 1853, gradually enlarging the circle of his studies, and obtaining fresh honors. In 1841 he published *Chapters on the Greek Poets*, which exhibit both purity of taste and breadth of scholarship. In 1844, appeared the first volume of his *magnum opus*, the *Greek Testament*, with notes and various readings; the second was not published till 1852. In 1853, he was removed to Quebec street chapel, London, where he continued to maintain his high reputation as a sound and eloquent preacher, until, in 1857, he was appointed dean of Canterbury by lord Palmerston. A.'s poetry is characterized not so much by depth or originality as by freedom from affectation, obscurity, or bombast. His *Greek Testament*, which was completed in 1861, occupies the first rank among English editions. Among his latest writings was *A Plea for the Queen's English*, which excited considerable discussion. He also published several volumes of sermons. He d. Jan. 12, 1871. See *Life, Letters*, etc., 1873.

ALFR, elves, or fairies; in Norse mythology, beings like the dwarfs, ranking between gods and men. There were two kinds—elves of light, and elves of darkness. Their abode is Alfheimr, (fairyland), and their king the god Frey.

ALFRED, surnamed THE GREAT, was b. at Wantage, in Berkshire, in 849. His father was Ethelwolf, son of Egbert, king of the West Saxons; and though the youngest of four sons, he succeeded to the throne, on the death of his brother Ethelred, at the age of 23. He had already given decisive proofs of high ability as a general in repelling the incessant incursions of the Danes, at that time the most terrible warriors in Europe. After he succeeded to the throne, he redoubled his exertions to restore the independence of his country. At first he strove without success, whilst the Danes continued to pour fresh bands upon the coast, and the Anglo-Saxons either bent to the yoke or forsook their homes. In 878 the invaders had completely overrun the whole kingdom of the West Saxons. A., no longer able to collect an effective army, was obliged to seek security in the hills and forests, and for some time found refuge in a cowherd's hut. He still, however, kept up some communication with his friends; and as soon as the people began once more to arm against the Danes, he built a stronghold on an elevation or island (still known as Athelney, i.e., the "island of the nobles," or the "royal island") amid the marshes of Somersetshire, to which he summoned his faithful followers. From this fortress he made frequent successful sallies against the enemy, and after a comparatively short time, he found himself at the head of a considerable army, with which he totally routed them, 878, near Edington, in Wiltshire. After holding out for some time in a stronghold to which they had retreated, the invaders capitulated. A. accepted hostages, and their solemn oath to quit his territory of Wessex, and receive baptism. Their king, Godrun or Guthrum, was baptized, with thirty of his followers, and ever after proved faithful in his allegiance to A.

After this decisive victory, the power of A. steadily increased, both by land and sea—for already he had built England's first fleet—he beat the Danes in numerous battles, and gradually their possessions were confined to the northern and eastern coasts. In 886, A., without any formal installation, became recognized as the sovereign of all England, a title to which he had proved his right by the most indisputable of arguments. During the ensuing years of peace, he rebuilt the cities that had suffered most during the war, particularly London; erected new fortresses, and trained the people to the use of arms; while at the same time he encouraged husbandry and other useful arts, and founded those wise laws and institutions which contributed so much to the future greatness and welfare of England. The grateful reverence of posterity has, as is usual with mankind, become prodigal in its awards, ascribing to A. the entire credit of having established many beneficial institutions, some of which had already existed among the Anglo-Saxons, but were by him revived, remodeled, and improved. Of his political institutions, little is known beyond the fact that he compiled a code of laws, divided England into counties, hundreds, and tithings, and thoroughly reformed the administration of justice by making these tithings, hundreds, etc., so far as was practically possible, responsible for the offenses committed within their jurisdiction. William of Malmesbury, with enthusiastic exaggeration, declared that a "purse of money, or a pair of golden bracelets," might in A.'s day be exposed for weeks in complete safety on the common highways. A. is also said—though erroneously, as is now believed—to have been the author of "trial by jury." In an age of ignorance and barbarism, A. was an accomplished scholar and a zealous patron of learning. No prince of his age did so much for the diffusion of knowledge, and few monarchs at any time have shown an equal zeal for the instruction of their people. He caused many manuscripts to be translated into Anglo-Saxon from Latin, and himself translated several works, such as Boethius on the

*Consolation of Philosophy*, the *History* of Orosius, Bede's *Ecclesiastical History*, and *Selections from the Soliloquies of St. Augustine*. Among his original works in the Anglo-Saxon language are *Laws of the West Saxons*, *Institutes*, *Chronicles*, *Meditations*, etc. All his works strikingly indicate the serious, elevated, and yet practical character of the man. In his translations, A. is frequently more than a translator. He adds his own reflections to those of his author; and expands the geographical outline of Orosius by a chart of Germany, an account of the Baltic, and the icy regions towards the north pole, which are pretty accurate, considering the means which then existed for acquiring a knowledge of these places. Several works attributed to A. are believed not to be genuine.

The peaceful labors of A. were, in 893, interrupted by a fresh invasion of Northmen under Hæsten or Hastings, more formidable than any that had yet been attempted in his reign. The defection of the East Anglians and Northumbrians added to the difficulties with which he had to contend. A., however, was fully prepared, and though, during their protracted stay in his dominions, the invaders overran a large extent of country, and committed considerable depredations, they were beaten in almost every encounter with the English, and finally quelled. A. died on the 27th of Oct., 1001, aged 52, leaving his country in the enjoyment of comparative peace and prosperity, the fruit of that wise and energetic rule which has made his memory dear to all generations of Englishmen as that of their best and greatest king. We cannot perhaps realize the resolute patience of A., in his political and military capacity, for we have but a very imperfect knowledge of the obstacles which stood in his way; but it must excite both our highest wonder and reverence to behold a man pursuing solitarily, in the midst of ferocity, barbarism, and ignorance, and in spite of the perpetual pains with which his body was racked, so many various and noble schemes for the civilization and true glory of his country.—The most authentic and interesting of the original sources of information on the history of A. is the life by Asser, bishop of Sherborne, a book distinguished by extreme simplicity and affection. The best edition is that of Wise, Oxford, 1782. Of the recent lives, the most complete and careful are that of prof. Reinhold Pauli, edited by T. Wright, and that by Mr. T. Hughes, 1869.

**ALFRETON**, a market-t. of Derbyshire, Eng., 12 m. n.n.e. from Derby, and a station on the Erewash branch of the Midland railway. It has manufactures of hats, stockings, and brown earthenware. There are collieries and iron-works in the vicinity. The town is irregularly built, and contains many very old houses, but has of late rapidly increased. It is said to derive its name from Alfred the great. Pop. '71, 3680.

**ALGA MARINA.** See GRASS WRACK.

**ALGÆ**, a natural order of plants, belonging to the class *cryptogamia* of Linnaeus, and to the *acotyledones* of the natural system. It contains a great number of species, about 2000 being known and described, and among these there is a great variety of forms. They grow for the most part in water, some in fresh and some in salt water, but some also on moist rocks or ground; whilst others are frequently found covering the glass and pots of hot-houses. Some species occur even upon diseased animal tissue, as *achlya prolifera* from the gills of fish, whilst *sarcinula ventriculi* (q.v.) appears to be formed in the human stomach. They are most numerous in still or stagnant water and in warm climates. Their structure is very various; they are found of all grades, from the little microscopic vesicle to great sea-weeds, which ramify like trees. The diversity in size is as great as in form; some species being visible only through the microscope, and resembling mold or rust; some a few inches, others several feet in length; whilst the *laminaria*, which float in the South American seas, measure more than 100 ft.; and *macrocystis pyrifera* of the Pacific ocean reaches the length of 1500 ft. Yet they are seldom to be found as thick as the finger, or as broad as the hand, although some far exceed these dimensions, the trunk of *lessontia fuscescens* attaining the thickness of a man's thigh. Some species are firmly fixed at the bottom of the water, some adhere to rocks and stones left dry by the retiring tide; some frequently break loose, and float about upon and beneath the surface. They have in no case proper roots, but merely processes for their attachment to the surfaces on which they are fixed; they seem to derive their nourishment by all parts of their surface from the water or moist air in which they grow. The gulfweed (*sargassum*) floats in long pieces in the Atlantic ocean and all the great seas; a large portion of the sea between the West Indies and the Canary islands is specially called the *Mer de Sargasse*. The weed is carried in such quantities by the current into the gulf of Mexico, that it covers the sea in tracts of many miles in breadth, and gives it the appearance of a meadow. Many fabulous stories were related of this gulfweed by the mariners of the 15th century. Ships were said to have been stopped in their course, and the crews obliged to cut their way through with hatchets. The discoveries of Columbus put an end to these exaggerated reports.

A. are entirely cellular in their structure, however elongated may be their fronds, having no proper vessels, but consisting of an irregular tissue of utricular cells. The fronds of many are articulated. Some of the simplest or lowest organization are propagated by spontaneous separation; in others, the reproductive organs consist of spores (see ACOTYLEDONOUS PLANTS) inclosed in *perispores*, and variously disposed in receptacles of different kinds; sometimes in the interior of the cells. *Antheridia* (q.v.) also occur in some; and *zoospores*, or spores with moving *cilia*, which exhibit phenomena

of motion, resembling those of animal life. The *diatomaceæ*, in which the ordinary mode of reproduction is by spontaneous separation, have by some been referred to the animal kingdom. They are entirely microscopic, resemble the animalcules called *infusoria*, and are generally found in still waters and moist places, but occur in prodigious numbers in some parts of the Antarctic ocean, where they give a color to the water.

A differ from fungi (q.v.) in deriving their nourishment exclusively, as it would seem, from the medium by which they are surrounded, and not from the substance upon which they grow. The substance of which they are composed is also very different. Yet it has been felt not a little difficult to determine to which order some of the lowest forms of vegetable life should be referred.

As to their substance, A. consist chiefly of vegetable gelatine, which dissolves in water when they are boiled in it. The harder parts of their fronds are sometimes coriaceous, or horny, or cartilaginous, but never really ligneous. Their color is not always green, but mostly brown or yellow, sometimes purple or violet, or rose-color; and many of them present a very beautiful appearance when examined through a microscope. Many contain an abundance of iodine. Different species of WRACK (*Fucus*) (q.v.), which are cast on shore in vast confused masses by the waves, are gathered and burned in the Orkney islands, in Normandy, and other parts of the world, the ashes forming an article of commerce under the name of KELP (q.v.), and containing much of the iodide of sodium. Sea-weeds of all kinds are an excellent manure. None of the species are poisonous, and some of them are used for food, a CARRAGEEN (q.v.) or Irish-moss, DULSE (q.v.), LAVER (q.v.), etc. The edible swallows nest of the Indian archipelago are composed of a species of sea-weed. Several kinds are eaten as articles of luxury by the Chinese. *Plocaria tenax*, one of the species so used, furnishes them also with an admirable glue, of which great quantities are prepared and brought to the market. *Plocaria helminthocorton*, Corsican moss, a native of the Mediterranean, and found principally around the shores of Corsica, is used as a vermifuge. See PLOCARIA.

This natural order is divided into 5 sub-orders, regarded by some as distinct orders—namely, CHARACEÆ (q.v.), FUCACEÆ (q.v.), CERAMICEÆ (q.v.), CONFERVACEÆ (see CONFERVA), and DIATOMACEÆ (q.v.). The Characeæ are sometimes separated as a distinct order of higher organization, whilst the rest are united under the name algae. See Kützinger's *Phycologia Generalis* (Leip. 1843), and his *Species Algarum* (Leip. 1849); Greville's *A. Britannica* (Lond. 1830); *British Sea-weeds*, nature-printed (London: Bradbury and Agnew).

**ALGAR DI, ALESSANDRO**, an Italian sculptor, b. at Bologna 1602, d. 1654, ranked next to Lor. Bernini among Italian sculptors of the 17th c., and especially excelled in the representation of nude figures. His works, however, suffered from the faults prevalent in his time, especially from a striving after pathos and picturesque effects, opposed to the true character of sculpture. His most important work is a colossal relievo of Attila in St. Peters, Rome. His statue of the god of sleep in the villa Borghese has frequently been mistaken for an antique.

**ALGAROTTA.** See CAROB.

**ALGAROTTI, FRANCESCO**, Count, an Italian author, was b. at Venice in 1712; studied in Rome and Bologna, and when 21 years old published in Paris (1733) a work, entitled *Newtonianismo per le Dame* (The Newtonian Philosophy adapted to the Ladies), which was the basis of his subsequent reputation. Until 1739, he lived in France. On his return from a journey to Russia, A. became acquainted with Frederick II. of Prussia, who elevated him to the rank of count, and made him, in 1747, lord chamberlain. He was also patronized by Augustus III. of Poland, and lived alternately in Berlin and Dresden until 1754, when he returned to Italy. He d. March 3, 1764, at Pisa, where, in the Campo Santo, Frederick the great raised a monument to his memory. In his own time he was recognized as a good judge of painting and architecture, and his reputation is confirmed by his work *Saggi sopra le Belle Arti* (Essays on Fine Arts), and by the paintings he selected for the Dresden gallery. His poetry displays no great genius; but his other works show that he was an accomplished man; and his letters rank with the best in the Italian language.

**ALGAROVILLA**, an astringent product of *Juga martha*, an acacia of New Granada; said to be four times as rich in tannin as the best oak bark. Black ink is made from it; also a yellow dye; and it is useful in medicine.

**ALGARVÊ**, the smallest and most southerly of the provinces of Portugal, lies between Andalusia and the Atlantic ocean. In ancient times it was much more extensive. It received its name from the Arabs, in whose language A. signifies "a land lying to the west." It was a Moorish province till 1253, when Alphonso III. united it to the crown of Portugal as a separate kingdom. Its area is estimated at 2020 sq. m., and its pop. is (1875) 192,000. The northern part of the province is occupied by a range of mountains of an average height of 4000 ft., which form the continuation of the Sierra Morena of Spain, and terminate in cape St. Vincent, the south-western extremity of Europe. The highest ridges are entirely destitute of vegetation; and the mountainous tract in general admits of but little cultivation. From the main ridge the country slopes southward in jagged terraces and low hills, leaving a level tract of a few miles along the coast. The soil of this plain

is but indifferently suited for the production of grain, or even of pasturage; but it produces abundance of the finest fruits of the south, even plantains and dates. The wine is also of excellent quality. The African heat of the climate is mitigated by the cool sea-breeze. The only river of importance is the Guadiana, on the frontiers of Spain. The inhabitants employ themselves chiefly in fishing, in manufacturing salt, and in cultivating fruit. They are considered the best sailors and the truest friends in Portugal. The chief t. is Faro (pop. 8500).

AL-GAZALI, ABU HAMED MUHAMMAD, 1058-1111; a Moslem theologian of the Ascharite sect, the head of the college at Bagdad. He visited the holy sepulchre at Jerusalem, and spent 10 years in Damascus; taught again in Bagdad 15 years, and spent his remaining life in retirement and philosophical speculation, settling finally with the Sufis, and becoming satisfied with their mystical claim to an intuition of the laws of life and of the immanent Deity.

ALGEBRA is a branch of pure mathematics. The name is derived from the Arabs, who call the science *al gebr wal mokibala*—i.e., supplementing and equalizing—in reference to the transposition and reduction of the terms of an equation. Among the Italians in early times it was called *arte maggiore*, as having to do with the higher kinds of calculation, and still oftener *regola de la cosa*, because the unknown quantity was denominated *cosa*, the "thing;" hence the name of *cosmical art*, given to it by early English writers.

The term algebraical is generally used somewhat vaguely, to denote any expression or calculation in which signs are used to denote the operations, and letters or other symbols are put instead of numbers. But it is perhaps better to restrict the name A. to the doctrine of equations (q.v.). Literal arithmetic, then, or multiplying, dividing, etc., with letters instead of Arabic ciphers, is properly only a preparation for A.; while analysis (q.v.), in the widest sense, would embrace A. as its first part. A. itself is divided into two chief branches. The first treats of equations involving unknown quantities having a determinate value; in the other, called the diophantine or indeterminate analysis, the unknown quantities have no exactly fixed values, but depend in some degree upon assumption.

The oldest work in the west on A. is that of Diophantus of Alexandria, in the 4th c. after Christ. It consisted originally of 13 books, and contained arithmetical problems; only 6 books are now extant. They are written in Greek, and evince no little acuteness. The modern Europeans got their first acquaintance with A. not directly from the Greeks, but, like most other knowledge, through the Arabs, who derived it, again, from the Hindoos. The chief European source was the work of Mohammed Ben Musa, who lived in the time of caliph Al Mamun (813-833); it has been translated into English by Dr. Rosen (Lond. 1831). An Italian merchant, Leonardo Bonaccio, of Pisa, traveling in the east about 1200, acquired a knowledge of the science, and introduced it among his countrymen on his return; he has left a work on A. not yet printed. The first work on A. after the revival of learning is that of the Minorite friar Paciolo or Luca Borgo (Ven. 1494). Scipio Ferreo in Bologna, discovered, in 1505 the solution of one case of cubic equations. Tartaglia of Brescia (d. 1557) carried cubic equations still further, and imparted his discoveries to Cardan of Milan, as a secret. Cardan extended the discovery himself, and published, in 1545, the solution known as "Cardan's rule." Ludovico Ferrari and Bombelli (1579) gave the solution of biquadratic equations. A. was first cultivated in Germany by Christian Rudolf, in a work printed in 1524; Stifel followed with his *Arithmetica Integra* (Nürnberg. 1544). Robert Recorde, in England, and Pelletier, in France, wrote about 1550. Vieta, a Frenchman (d. 1603) first made the grand step of using letters to denote the known quantities as well as the unknown. Harriot, in England (1631), and Girard, in Holland (1633), still further improved on the advances made by Vieta. The *Géométrie* (1637) of Descartes makes an epoch in A.; it is rich in new investigations. Descartes applied A. to geometry, and was the first to represent the nature of curves by means of equations. Fermat also contributed much to the science; and so did the *Arithmetica Universalis* of Newton. To these names may be added MacLaurin, Moivre, Taylor, and Fontaine. Among the chief promoters of A., in more recent times, are Euler, Lagrange, Gauss, Abel, Fourier, Peacock, De Morgan, etc.

ALGECIRAS, or ALGEEZIRAS, a t. in Spain, in the province of Cadiz, on the gulf of Gibraltar. Its harbor is bad, but it possesses a good dock, and the inhabitants are supplied with fine aqueducts. The citadel is in a very dilapidated condition, and the trade in corn and brandy is no longer important. The place, however, which is pleasantly situated, has a picturesque appearance. It was the first t. in Spain taken by the Moors (718), in whose possession it remained for 7 centuries; but in 1344, after a siege of 20 months, it was retaken by the brave Alfonso XI., king of Castile. It is said that crusaders from all parts of Europe were present at this siege, which was the siege of the age, and is spoken of as such. Edward III. of England purposed coming in person to the assistance of the Spanish monarch, whom he greatly admired. Alfonso destroyed the old Moorish town; the modern one was built by Charles III. in 1760. On the 6th of June, 1801, between A. and Tarifa, the English admiral Saumarez attacked the combined French and Spanish fleets under rear-admiral Luinois. He was defeated, but renewed the engagement a few days after, and gained a complete victory. A. is 5 m. from Gibraltar, across bay or gulf, and 10 round by land. Pop. 11,500.

ALGER, WILLIAM ROUNSEVILLE, b. Massachusetts, Dec. 11, 1823; a graduate of Harvard in 1847; author of a *Critical History of the Doctrine of a Future Life, Genius of Solitude, Friendships of Women*, etc. He was pastor of the church of the Messiah, Unitarian, in New York city, 1875-76.

ALGER'BA, a double star in the sign Leo, noted as a test for telescopes; one component is orange and the other green.

ALGE'RIA (in French, ALGÉRIE), a country on the n. coast of Africa, which was a subordinate part of the Turkish empire till 1830, and is now a French colony. It lies between 2° 8' w. long. and 8° 32' e. long. It is bounded on the n. by the Mediterranean, on the e. by Tunis, on the s. by Sahara, and on the w. by Morocco. The French have extended their dominions more than 200 m. into the interior, but those of the deys—the former rulers of A.—comprehended territories lying nearly twice as far s. The area of A. is now calculated to be about 150,000 sq. m.; and the pop. (1877) 2,867,626, including about 300,000 Europeans. The chief towns are Algiers, Bona, Constantine, and Tlemzen. Upwards of 5,000,000 acres are under cultivation. Physically, A. forms a part of the northern border of the great plateau of north Africa, which here rises from the sea in three terraces. The Atlas mountains run parallel to the coast-line. Behind these, a vast tract of healthy plains, called the *sebkhas*, interspersed with salt lakes, stretches southwards, until bounded by a second chain of mountains of various heights; beyond which, again, lies the great desert of Sahara, extending to the banks of the Niger. The plains and valleys which open out towards the sea in the n. of A., such as these round Bona, Algiers, Oran, etc., are extremely fertile, abound in wood and water, consist mostly of a calcareous soil, and are well adapted for agriculture. They form the *Tell*, which was once one of the granaries of Italy. In strong contrast to these are the *sebkhas*, or lesser deserts, covered with herbs and brushwood, but almost destitute of fresh water, except where here and there they are interrupted by an oasis. The most southern part of the country beyond the Atlas partakes of the nature of the Sahara, but contains oases covered with palm trees, and well peopled. This is a part of the "date country," or "Blad-el-Djerid." There are no rivers of any importance in the entire colony, nothing beyond mere coast-streams, which rise in the neighboring Atlas. The largest is the Shelif, about 230 m. in length. With respect to the climate, the heat in the *Tell* is sometimes very great. On the coast it is mitigated by the sea-breeze, and among the high mountains of the interior the winters are even cold. The average temperature of Algiers is about 63° F. A. is not unfrequently visited by the *simoom*, or hot wind, called by the Italians *sirocco*, and by the Spaniards *solano*. Its mineral wealth is considerable; iron, lead, copper, and manganese are found. The marble of Numidia was in requisition in ancient times. Extensive forests of oaks, cedars, pines, and pistachio-nut trees cover large portions of the country, and furnish an abundant supply of timber and resin. The cereals and the olive are cultivated in the *Tell*, and the oases of Sahara are famed for their dates. The domestic animals of A. are the ox, the sheep, the goat, and the camel; but the once noble race of Numidian horses is degenerated. The population is composed of various elements. Besides Europeans, there are Kabyles and Arabs, who compose the bulk of the people; also Moors, Negroes, and Jews.

*Language.*—Four languages are spoken in A.—the Berber, the Arabic, the Turkish, and the Negro dialects. The Berber, which is the most ancient of all, has a variety of dialects, and is spoken by all the Kabyle tribes. It possesses no literature written in its own alphabet. Arabic characters alone being used. The Arabic is of course an importation from the east, and has borrowed expressions and idioms from the various native languages with which it came into contact; but its differences are comparatively slight. The Koran is the great bond of union. The Turkish, since the French conquest, has become almost extinct. The Negro dialects are of little consequence.

*History.*—In the most ancient times we find the Numidians settled in the eastern part of the regency, and the Moors (or Mauri) in the west. Under the Romans, the former was included in the province of Africa, while the latter was called Mauritania Caesariensis. Like the rest of north Africa, it had then reached its highest prosperity. It had numerous cities, which were principally Roman colonies. But its conquest by the Vandals, under the famous Genseric, about 440, threw it back into a state of barbarism, from which it only partially recovered after the Mohammedan immigrants had established their dominion. About the year 935, the city, Al-Jezira, i. e., the island, and later Al-Gazie, i. e., the warlike, now called Algiers, was built by an Arabian prince, Zeiri, whose successors ruled the land till 1148, after which it was governed by the Almohades (q. v.) till 1269. It was then split up into many small territories. In 1492, the Moors and Jews who had been driven out of Spain settled at A., and began to revenge themselves on their persecutors by piracy. Ferdinand, the Spanish monarch, attacked them on this account, took the city of Algiers in 1509, and erected fortifications on the island which forms its harbor. One of the Algerine princes, the emir of Metidja, whose territories were threatened by the Spaniards, now invited to his assistance the Greek renegade, Horuk or Harude Barbarossa, who had made himself famous as a Turkish pirate chief. This laid the foundation of the Turkish dominion; for when Barbarossa arrived in 1516, he treacherously turned his corsair bands against the emir, whom he murdered, and then made himself sultan of Algiers. His subsequent successes alarmed the Spaniards, who marched an

army against him from Oran. Barbarossa was defeated in many encounters, and at last, being taken prisoner, was beheaded in 1518. His brother was then chosen sultan. He put himself under the protection of the Ottoman court, by the help of a Turkish army drove the Spaniards out of the country, and established that system of military despotism and piracy which lasted till 1830, and which sunk A. into a state of ruinous degradation. In 1541, the emperor Charles V. made a bold attempt to crush this nation of corsairs. He landed in A. with a fleet of 370 ships and 30,000 men; but a fearful storm, accompanied by earthquakes and water-spouts, destroyed the greater portion of the former, and rendered the latter destitute of victuals, etc.; so that the expedition proved a failure, and Charles was glad to re-embark, which he managed to do with extreme difficulty.

The history of A., under the Moslems, offers few episodes worthy of notice. The Algerines continued to carry on their piratical war against the powers of Christendom, venturing even to land on the Italian and Spanish coasts. Inland, too, they were constantly fighting to extend their territories. Before the end of the 16th c., they had subdued the whole country to the verge of Morocco, with the exception of Oran, which belonged to Spain. The Spaniards were invariably unsuccessful in their attempts at reprisals. Emboldened by success, the Algerines pushed their piratical expeditions even beyond the straits of Gibraltar. In the year 1600, the Turkish janissaries of Algiers obtained from the Constantinopolitan court the right to choose a dey from among themselves, who should share the power with the pasha appointed by the sultan, and be their commander-in-chief. The result of this divided authority was internal strife and confusion. Nevertheless, the insolence of the Algerines at sea increased. They attacked even the coasts of Provence, compelling Louis XIV. to chastise them thrice; which he did, however, with very little effect. An incident occurred during the first bombardment of Algiers by the French fleet in 1683, which illustrates the reckless ferocity of these corsairs. By way of answer to the cannonading of his enemies, the dey caused the French consul, Vacher, to be shot off from the mouth of a mortar! After the third bombardment, in 1687, the dey scornfully inquired of the French how much money the burning of Algiers had cost their master, and on being told, coolly replied that "he would have done it himself for half the sum, and spared their king the trouble." No more decisive result followed the attack of admiral Blake in 1655, nor of the English and Dutch fleets in 1669 and 1670; yet the English were the first to form treaties with the Algerines. In 1708, the dey, Ibrahim, made himself master of Oran, and his successor, Baba-Ali, succeeded in effecting the virtual emancipation of the country from the dominion of the porte. He banished the Turkish pasha; craftily persuaded the sultan of Turkey to leave the power solely in his hands; carried on war and concluded peace at his own pleasure, and paid no more tribute.

A. was now ruled by a military oligarchy, at the head of which stood the dey, and after him the powerful Turkish militia, recruited from Constantinople and Smyrna, because their children by native mothers could not enjoy the same privileges as themselves. Besides these, there was a divan, or council of state, chosen from the sixty principal civil functionaries. The internal history of the country henceforth presents nothing but a bloody series of seraglio revolutions, caused by the lawless janissaries, who permitted few of the deys to die a natural death. In the year 1775, Spain undertook her last great expedition against A., with 44 ships of war, 340 transports, and 25,000 soldiers. This, however, was as singularly unfortunate as all her previous ones. Everything went wrong, and the Spaniards had to re-embark as speedily as possible, leaving behind them 1800 wounded, and all their artillery. Thus A. continued to defy the greater Christian powers, and to enforce tribute from the lesser. During the French revolution and the time of the empire, its piracies were much diminished in consequence of the presence of powerful fleets in the Mediterranean sea; but at the close of the war they were recommenced as vigorously as ever. This brought down upon "the nation of corsairs" the vengeance of the Christian powers. The Americans took the lead, attacked the Algerine fleet off Carthage, on the 20th June, 1815; defeated it, and compelled the dey to acknowledge the inviolability of the American flag. About the same time, the English admiral, lord Exmouth, extorted from the other states of Barbary the recognition of an international law respecting the treatment of prisoners. A. alone refused to consent to it; and after a delay of six weeks, the English and Dutch fleets, under the command of lord Exmouth, fiercely bombarded the capital. The batteries of the pirates were soon silenced; and in a few hours the half of the city lay in ruins; its naval force and its magazines being all destroyed. The dey, an ignorant and obstinate barbarian, still wished to protract the fight, but his soldiery forced him to yield, and a treaty was concluded (1816), by which all Christian slaves were released without ransom (the number was 1211), and a promise was given that both piracy and Christian slavery should cease forever. But nothing could keep these wretches from piracy. As early as 1817, they ventured as far as the North sea, and seized all ships in their course not belonging to any of the powers who sent them tribute or presents, as was done by Sweden, Denmark, Portugal, Spain, Naples, Tuscany, and Sardinia. Nor did even treaties avail to protect European vessels at all times. The Spanish, the Papal, and in particular the German shipping suffered severely; while the dey mocked by his insolent replies the remonstrances addressed to him.

Meanwhile the internal condition of A. continued to present the spectacle of a cruel

prætorian despotism. In the year 1817, the power of the janissaries was greatly weakened by the skillful tactics of the dey Ali. Upon his death, which was occasioned by the plague in the following year, Hussein was chosen in his stead, under whom the Moslem dominion was terminated by a conflict with France. The causes of this conflict were various. A French trading brig was plundered in Bona in 1818; the dwelling of the French consul was attacked in 1823; Roman ships, sailing under the protection of the French flag, were seized; and even French ships were detained and plundered. But the chief cause of the quarrel was a dispute about the payment of a debt incurred by the French government to two Jewish merchants of Algiers at the time of the expedition to Egypt. This debt was fixed at seven millions of francs; four and a half millions were immediately paid; the rest was reserved until the counter-claims of certain French creditors should be decided in the French law courts. For three years the lawsuit dragged its slow length along, till the dey became impatient—being himself a principal creditor of the Jewish-Algerine house—and angrily demanded payment from the king of France. To his letter no answer was returned. The feast of Beiram occurring soon after, when it was customary for the dey to receive all the consuls publicly, he asked the French consul why his master had remained silent. The latter haughtily replied that “a king of France could not condescend to correspond with a dey of Algiers.” Upon this, the dey struck him on the face, and fiercely abused his sovereign. In consequence of this insult, a French squadron was sent to Algiers, which received the consul on board, and blockaded the city, 12th June, 1827. Six days after, the dey caused the French coral-fisheries at Bona to be destroyed. For three years the blockade was listlessly carried on; but in April, 1830, during the ministry of Polignac, a warlike manifesto appeared; and a month later, a fleet sailed for the African coast, consisting of 100 ships of war and 357 transports, having on board an army of 37,000 infantry, 4000 cavalry, and a proportionate number of artillery, under the command of Lt-gen. Bourmont. The landing was effected under trifling opposition. A perpetual skirmishing then took place previous to the bombardment of Algiers, which commenced on the 4th July. Next day a capitulation was agreed to. The Turkish soldiers marched out—for such were the conditions—with their families and private possessions, and the French took possession of the place. Fifteen hundred guns, 17 ships of war, and 50,000,000 francs fell into their hands as spoil. The dey retired to port Mahon, with his private property and a train of 118 persons, while the greater number of the Turkish janissaries were conveyed to Asia Minor. The conduct of the French soldiery, however, it must be confessed, tarnished the glory of their conquest. They went about plundering remorselessly the beautiful villas and gardens in the neighborhood of Algiers, as well as the ancient valuables and works of art; thus exciting a universal spirit of hostility in the natives, who kept up an incessant guerilla warfare outside the capital.

After the revolution of July, marshal Bourmont resigned, and gen. Clausel was appointed his successor. The latter, who was a prompt and vigorous man, set about subduing the country, and giving it a regular government. His predecessor had committed a great mistake in driving out the Turks, who might have been usefully employed in subordinate functions of authority. After their banishment, the Kabyles and Bedouins, believing themselves emancipated from all subjection, and stimulated by intense fanaticism against the new conquerors, rose in rebellion, or rather commenced a series of petty struggles, which obstructed the colonization of A. for many years, and which cannot be said to have altogether ceased even yet. The imposition of French laws and institutions was made not in the wisest spirit, most of the old Turkish regulations being summarily abrogated. Besides this, the natives were wounded in their most susceptible point. Their mosques and burying-grounds were frequently desecrated and destroyed; and Clausel, whose vigor was more remarkable than his justice or prudence, confiscated—in direct contradiction to the very words of the capitulation—all the immovable property of the deys, and other exiled Turks, and of the townships, besides various religious institutions. The effect of these political crimes was instant. The entire provinces determined obstinately to resist; some even of the provincial rulers who had previously submitted, now appeared in arms again. Clausel was compelled to undertake a military expedition against the refractory beys; but his uncertain successes only inflamed the hatred and patriotism of the Kabyles and Arabs, who opposed him energetically. A young emir at last appeared on the scene, Abd-el-Kader (q.v.), who soon became the rallying-point of the *jad* (“holy war”), which the Marabouts had begun to preach. Under these circumstances, it became impossible for Clausel to carry out his scheme of colonization, and only a reckless speculation in land took place, which was in every way injurious. To strengthen his position, the French general, whose army was now greatly reduced, made a treaty with the bey of Tunis; but the home-government disapproving of it, he was recalled in consequence. His successor, gen. Berthezène, having achieved nothing but defeat and disgrace in spite of his cruelties, was also speedily recalled, and Lt-gen. the duke of Rovigo appointed to the command. He arrived in Algiers on the 25th of Dec., 1831, and established a most severe and relentless system. He scrupled not to perpetrate the most arbitrary acts, cruelties, and treacheries. His two most remarkable actions were, first, the complete annihilation of the whole Arab tribe El-Uffia, when even old men, women, and children were massacred during the night, on account of a robbery committed by some of the members of the tribe; second, the exe-

ention of two Arab chiefs who were hostile to him, and whom he had treacherously allured into the city by the written promise of a safe-conduct. Such monstrous proceedings fired the entire nation. The most peaceful tribes flew to arms, and the French were attacked on all sides. The emperor of Morocco, who secretly fomented the strife, and even meditated the conquest of Oran, assisted the fierce and impetuous Abd-el-Kader in his designs. The health of the duke now declined. He returned to France in March, 1833, and the administration of affairs was provisionally intrusted to gen. Avizard, who gained some credit by establishing the *bureau Arabe*. After the death of the duke, gen. Voirol, a man exactly the reverse of his predecessor, was made interim commander-in-chief. His efforts were more directed to promote the material interests of the colony, than to extend the power of France. He met with little opposition in the province of Algiers, and in the eastern districts; but, on the other hand, the war raged fiercely in the west, where Abd-el-Kader had either gained over or subdued all the tribes between Mascara and the sea. At length a treaty was effected with him, in which he pledged himself to make peace, and to deliver up all his prisoners. In return, he received a monopoly of the corn-trade, and the right to buy arms and ammunition in the French ports. Towards the end of 1834, the French government, having resolved to retain permanent possession of the colony, organized its administration anew, placing the supreme power, both civil and military, in the hands of a governor-general, who received his orders from the minister of war. Gen. Drouet d'Erlon was the first appointed to this high dignity. Under him there were a commander of the troops, a commander of the naval force, a military intendant, a civil intendant, and a director of finance. The administration of justice was also regulated by the erection of many tribunals. Frenchmen and foreigners were to be subject to French laws, but the natives to their own. Moreover, the old Algerine courts of justice were still to be kept up. D'Erlon apparently desired, at first, to occupy himself with the internal administration of the regency, and, in truth, deserved much credit for the introduction of French municipal institutions, and the French system of education and police arrangements; but a disgraceful defeat suffered by the French army at Makta, on an expedition against Abd-el-Kader, who had secretly broken the treaty, caused the recall both of the officer in command and of D'Erlon himself. Clausel was now sent back to A. with the title of marshal. He arrived on the 10th of August, 1835, his first anxiety being to wipe away the disgrace of the defeat at Makta. About three months after, he marched out at the head of 11,000 men, to attack Mascara, the center of Abd-el-Kader's power: he had to fight many petty battles on his way, but was always successful. On reaching Mascara, he resolved to set it on fire, which he did on the 8th Dec., and then commenced his retreat, in which his army suffered severely from bad weather, and from perpetual harassments by the enemy. Abd-el-Kader was soon more powerful than ever, and gen. Bugeaud had to be sent out from France with reinforcements; but nothing came of this save a few fruitless victories over Abd-el-Kader, which did the latter no real harm. Bugeaud was at length compelled to make peace on the 30th May, 1837. Abd-el-Kader recognized the sovereignty of France over the regency: he received, in return, the government of the provinces of Oran, Titeri, and Algiers, with the exception of the cities of Oran, Arzeu, Masagran, Mostaganem, Algiers, Blidah and Koleah, Sahel (or the "sea-coast"), and the plain of Metidja. In exchange for the city of Tlemzen, he delivered to the French army 60,000 sacks of corn, and 5000 oxen: he was likewise permitted to buy arms and ammunition in France. In Feb., 1837, marshal Clausel was recalled, and Lt-gen. Damrémont succeeded him. The condition of the colony was at this moment desperate, for the disgraces which followed the rash and even reckless measures of Clausel had everywhere lowered the *prestige* of the French army. The duty of the new governor-general was clear, but difficult: he had to wipe out the stain which attached to the honor of his soldiery, and to re-create the conviction of their superiority. He first attacked the Kabyles of the province of Algiers, and chastised them with considerable severity, and then commenced his great work of taking Constantine, from which his predecessor had been compelled ignominiously to retire. In the month of May, with an army of 12,000 disciplined troops, besides *Zuavi* (originally light infantry raised among the natives), *bataillons d'Afrique* (convict-battalions at first), the *tirailleurs d'Afrique*, and the *chasseurs d'Afrique*, as well as the Spahis (a cavalry corps composed of native soldiers commanded by French officers), Damrémont marched to the attack of Constantine, and, in spite of fearful weather, succeeded in storming the city on the 18th. This victory laid the foundation for the entire subjugation of the province of Constantine, which was completed in the course of the two following years without any great effort.

On Dec. 1, 1837, gen. Valée was appointed governor-general in the stead of Damrémont, who had fallen at the storming of Constantine. He, like the others, misunderstood the character of Abd-el-Kader when he considered it possible for him to remain quiet. New treaties were made, which only delayed hostilities. Meanwhile, the work of colonization went on in spite of numerous obstacles. The province of Constantine was much improved by the building of towns and the making of roads; but suddenly, in Oct., 1839, Abd-el-Kader, whose power had now become formidable to an unprecedented extent, violated the treaty on an insignificant pretext, and fell upon the unprepared French with an overwhelming force. The European settlements in the open plain were attacked and laid waste, bodies of French troops were surprised on their

march and cut to pieces, small outposts and encampments were taken in a moment, and by the 24th of Nov. the dominion of the French was confined to the fortified cities and camps. Even the settlements in the plain of Metidja were lost. Forty thousand Arabs swept over it, and threatened Algiers itself. This state of things demanded energetic measures. The spring campaign was vigorously opened on both sides: everywhere the French gained splendid successes; while the heroic defense of the fort of Masagran, near Mostaganem (garrisoned by only 123 men), against from 12,000 to 15,000 Arabs, who stormed it incessantly, and with the utmost fury, for three days, raised the *prestige* of the invaders higher than ever. Still, however, nothing was really accomplished. After repeated bloody defeats, the native tribes again rushed to arms, swept the plains, and rendered life insecure at the very gates of Algiers. The only thing of any practical importance which took place during the whole year was the beginning of the circumvallation by which the fertile plain of Metidja was to be secured against the hostile incursions of the Arabs. Marshal Vulee was now recalled, and Lt.-gen. Bugeaud appointed his successor. The latter arrived at Algiers on Feb. 22, 1841, and adopted a new system, which was completely successful. A brave, inexorable, and unscrupulous man, he resolved to employ any and every means for the attainment of his purpose. He wearied out the enemy by incessant *vazzies* (predatory excursions) against individual tribes, corrupted them (not a difficult thing to do) by all the arts of bribery, and on special occasions undertook great expeditions to annihilate the regular power of Abd-el-Kader, whose strong defensive positions he destroyed, and whose authority he spared no pains to undermine. The French army was raised to 80,000 or 100,000 men. Its operations were carried on from three principal points. Victory followed Bugeaud wherever he went. He relieved and victualled hard-pressed garrisons; intimidated the surrounding country; penetrated to Tekedempt—the very stronghold of Abd-el-Kader himself—which he laid in ashes; marched thence to Mascara, which was also taken; and on all sides received the submission of the terrified Arabs. Even the hottest period of the summer was made use of. Bugeaud bribed and seduced from their allegiance those Arabs who were under the sway of Abd-el-Kader. The autumn campaign was for the time decisive. Saida, the last fortress belonging to the gallant emir, was utterly destroyed, and now almost the entire country was subdued. Abd-el-Kader retired into Morocco, where he raised a new army, for his old one had been completely annihilated. He was, however, defeated by gen. Bedeau, and again compelled to retreat into Morocco, from which, however, he issued a second time, in the summer of 1842, and contrived to maintain a fierce but desultory warfare, for two or three years, aided by the sultan of Morocco. At last, however, deserted by most of his followers, pursued by his late ally, and, in fact, hemmed in on all sides, he was forced to surrender to gen. Lamoricière, at the close of Dec., 1847. See ABD-EL-KADER.

The revolution of Feb., 1848, somewhat disturbed the progress of conquest and subjugation in A. That superb race of mountaineers, the Kabyles, descendants of the ancient Numidians, and possessed of the same fiery and dauntless spirit, broke out into a new insurrection, which, however, was speedily quelled. The national assembly now offered to the European population of A. to incorporate the country with the republic of France, and to grant it all the accompanying political privileges of a French province; but intelligent men of all parties acknowledged the uselessness and danger of this step. It was, therefore, simply declared to be a permanent possession of the republic. Four deputies from the colony were permitted to take a part in all discussions in the national assembly on Algerian affairs. Meanwhile, the work of conquest, colonization, and, in some respects, civilization went on. The French troops penetrated into the far south, almost to the borders of Sahara, sternly reducing to obedience the desert tribes, who manifested a not unnatural antipathy to these inroads, and in some cases fiercely resisted the invaders. Various tribes of the Kabyles, too, opposed every attempt at organized taxation, and the imposition of civilized discipline: the result of which patriotic obstinacy was, a new campaign against them by the French gen. Bugia. Fortune again declared for the invaders; but the most alarming insurrection was that excited by the Cherif Bou-zian, who fled for freedom to Zaatcha in the oases. The French pursued him thither; but were beaten, and had to retreat. Some months after, they returned largely reinforced, and in spite of the broad belt of palm-trees which hindered their operations, and the wild and strenuous heroism of the besieged, the place was stormed and destroyed. The defenders all perished.

In 1853-54, and again in 1856-57, expeditions were organized against the Kabyles, though not altogether with the will of the colonists, who could not but recognize the great intelligence and industry displayed by that highland race. The struggle was sanguinary and barbarous on both sides, but the French at last subdued their enemies. For two years (1858-60) the military government of A. was superseded by the institution of a special ministerial department for A. and the colonies, which was first of all intrusted to prince Napoleon. In Dec., 1860, however, a military government was re-instituted, and marshal Pélissier made governor-general, with a vice-governor under him, a director-general for civil affairs, and a council of thirty members. In 1863, the emperor Napoleon announced that he was willing to give the colony a new constitution, with a chamber of representatives for provincial affairs: he also addressed a letter to

the governor-general, in which he explained that A. was no colony in the strict sense of the word, but an Arabian kingdom; and that the natives had the same right to protection as the colonists. In 1864, however, strife again arose between the colonists and the Arabs; and it was only after several engagements, during the months of April and May, that peace was restored by the submission of the conquered tribes. Pélissier having died in May, 1864, marshal MacMahon was appointed to succeed him. In the following year, the emperor himself made a journey to A., and, on March 5 issued a proclamation, in which, although explaining to the Arabs that A. must continue to be united to France, he promised to maintain their nationality, and at the same time gave them assurance that they should always remain in undisturbed possession of their territories. Yet these and other measures for conciliating the Arabs were all in vain; for, shortly after the emperor's return to France, insurrections broke out in the province of Oran and elsewhere. Si-Hamed, a native chief, with 12,000 horsemen at his command, began to harass those tribes which remained in submission, until he was routed by col. Colomb of Geryville, and forced to escape into Sahara: after which, in the beginning of 1867, two expeditions, led by Colomb and Souis, succeeding in reducing to submission the other tribes which had revolted. In 1867 and 1868, a severe and general famine checked the military enterprises of the Arabs; and there was peace till 1870, when, the Franco-Prussian war having begun, the emperor found it necessary to withdraw to Europe the greater part of the forces in Africa. MacMahon's place was then taken by gen. Durieu, as interim governor-general; and the natives began to entertain hopes of freeing themselves from the yoke of France. Movements were begun in the provinces of Constantine and Oran, which it required all gen. Durieu's vigilance and activity to hold in check. After this, again, some disorder arose among the colonists themselves, who strongly desired the abolition of the military government—a change which the new republican government at Paris soon gratified them by effecting. To Durieu's place was appointed a civil governor, and under him prefects for each of the three provinces. A council was formed—composed of the prefects, archbishop, commander of the army, and other members appointed by the French government—with which, in all important cases, the governor has to take counsel. The territory of the Sahara and adjoining districts remain exclusively under military rule.

The French troops still stationed in A. consist of one "corps d'armée," numbering 60,000. It is said that the possession of A. has cost France the lives of 150,000 men, besides £120,000,000 in money. The revenue of A. is derived chiefly from indirect taxes, licenses, and customs duties on imports. In 1875 it amounted to 52,386,955 fr., and the expenditure to 57,110,872 fr. The cost of maintaining the army, however, the outlay for public works, and other large sums disbursed—estimated in 1877 at 25,111,472 fr.—are not included in the expenditure, being provided out of the French budget.

Since the subjugation of A., the French have conferred various benefits on the colonists and native tribes, not the least important of which has been the digging of Artesian wells (q.v.). In May, 1856, a "boring" was commenced in an oasis of the Sahara or desert of the province of Constantine. A civil engineer, a sergeant of Spahis, and a detachment of soldiers of the foreign legion, succeeded in bringing to light a splendid fountain or river, yielding not less than 4010 quarts of water per minute. The work was considered a miracle. From all quarters the Arabs flocked to behold and enjoy it. The native priests blessed it, naming it the "Fountain of Peace." Another well was termed the "Fountain of Benediction." In the oasis of Sidi-Rached, unproductive for want of water, a well was dug, and a depth of 54 mètres yielded 4300 quarts per minute. It is known as the "Fountain of Gratitude," and the enthusiasm excited at its opening was boundless. The idea of providing such wells has rightly been considered "a stroke of strong political wisdom."

The government has done service to the colonists by encouraging the formation of banking-companies, etc. In 1875 there were about 350 m. of railway in operation, consisting of three lines—viz., one from Algiers to Oran, one from the sea to Constantine, and one from Bona to the mines of Ain Mokra. A telegraph cable was laid in 1870 between Bona and Marseilles; and there are 5830 m. of inland telegraphs, including branches to Tunis.

It would be too much to affirm that the colonization of A. has advanced rapidly. The French government has acted neither very promptly nor very liberally towards settlers; and the number of formalities which require to be gone through before one can properly secure the land which he has purchased, often disgusts the poor farmer. However, great efforts have been made for the improvement of agriculture: altogether, 5,139,136 acres are stated as being under cultivation, 413,112 acres being cultivated by Europeans. The total exports of A. amounted in 1876 to £6,660,000: the imports, to £8,540,000. In 1875, 36,580 tons of alfa fibre or esparto grass for making paper was exported, chiefly to Great Britain. A number of Mohammedan schools for instruction in French and Arabic have been established, and are regularly attended by pupils of both sexes, who learn to read and write fluently in the French language, and to keep accounts. In Algiers itself there are several of these schools, where female children are taught sewing. Thus, although progress is slower than might have been anticipated, it is real, and its pace accelerating. When fierce memories have been softened by time, and such atroci-

ties as those of Dahra (q. v.) have been forgotten in the substantial blessings which an enlightened civilization cannot fail to bestow, the presence of the French in A. will cease to be deplored by the natives.

**ALGERIA** (*ante*). At the close of 1877, the area of A. was 122,914 sq. m., and the pop., exclusive of wandering tribes, 2,867,626. The country is divided officially into civil territory and military territory, and there are three divisions of each:

Territories.	Sq. Miles.	Civil Pop.	Sq. Miles.	Military Pop.
Algiers.....	3,180	484,771	37,369	387,836
Oran.....	5,906	416,465	27,310	256,716
Constantine.....	6,914	414,716	41,999	727,124
Total.....	16,000	1,315,952	106,478	1,351,676

The French settlers numbered 127,321, and the whole pop. of European descent was 302,576. At the end of 1877 there were 340 m. of railway open for traffic, in three lines: Algiers to Oran, 226 m.; Philippville to Constantine, 55 m.; Bona to the mines of Ain Mokra, with branches, 59 m.; and a central line was under construction in 1878 from the frontiers of Tunis to Morocco, 820 m. There were 5850 m. of telegraph, with 9860 m. of wire.

**ALGHERO**, or **ALGHERI**, a sea-port on the w. coast of the island of Sardinia, 15 m. s.w. from Sassari. It is well defended towards the sea, being built on a rocky point, and surrounded by thick walls, but is commanded by some hills which overhang the town. A. has a cathedral, several convents, a college, and public schools. It exports wine, tobacco, anchovies, skins, coral, bones, etc. It was a favorite residence of Charles V., in whose time it belonged to Spain. Pop. 8000.

**ALGIERS** (Arabic, Al-jezira, the island), the capital of Algeria, was built about 935 A.D. by an Arab chief. It rises from the sea-shore up the sides of a precipitous hill in the form of an equilateral triangle. The apex is formed by the Casbah, the ancient fortress of the deys, which is 500 ft. above the sea-level, and commands the whole town. The base is a mile in length. The present city may be regarded as divided into two parts: the old, or high town; and the new, or low town. With the exception of some mosques, the latter consists of wharfs, warehouses, government houses, squares, and streets, principally built and inhabited by the French, while the former is almost wholly Moorish both in its edifices and inhabitants. The great center of bustle and activity in A. is the Place Royale—a large oblong space in the center of the town, planted with orange and lime trees, and surrounded by houses in the European style. Here may be found as motley a crowd as anywhere in the world, denizens of all nations—Arabs, Moors, Jews, French, Spaniards, Maltese, Germans, Italians, etc. The city is intersected by two large parallel streets, Bab-el-Ouad and Bab-azoun, running n. and s. for more than half a mile. They are flanked by colonnades, but are very narrow, and therefore inconvenient for traffic; as promenades, however, nothing could be more agreeable. In 1853, A. had upwards of 100 mosques and marabouts. The mosques are divided into two classes—the djamas, or principal mosques, and the mesjids, or inferior mosques. The marabouts are the tombs and sanctuaries of saints. Everywhere A. wears the aspect of a rising colonial city. Other towns in the province still retain their oriental character, with the exception of a few military buildings; but the new town of A. might deceive the traveler into the belief that he is still in Europe, were it not for the throng of swarthy faces he meets. The streets are regular, spacious, and elegant, some of them as handsome as the Parisian boulevards, and adorned with arcades. The shops, too, are occasionally very good. The houses are in some instances five stories high, which, though it gives a massive and imposing appearance to the city, is yet a very perilous innovation in a place which has suffered dreadfully from earthquakes.

But perhaps greater interest attaches to the old Moorish town, which is connected with the new by a steep, narrow, jagged-looking street called the Casbah, leading down from the fortress of the deys. The houses are square, substantial, flat-roofed; rise irregularly one over the other, and have no windows, but only peep-holes, which are intended to exclude impertinent eyes, and are therefore fortified with iron gratings instead of glass, so that the houses have a very prison-like appearance. Although the streets at first contrast unfavorably with those of Europe, on account of their narrowness, the coolness which this secures soon reconciles the traveler to other inconveniences. The inhabitants have recourse to their flat roofs or terraces in the evening, to enjoy the delicious sea-breeze. The French have introduced many useful reforms. There are conduits in every part of the city, public baths, coffee-houses, hotels, omnibuses, etc. The markets are held in the squares de Chartres, Mahon, and d'Isly. Horse-racing is the great amusement. The Arabs are passionately fond of it. The French have also improved, at great expense and labor, the port, which was in a precarious condition. The town has supreme courts of justice, a chamber and tribunal of commerce, a college and schools, a Catholic cathedral and several churches, a French Protestant church, a synagogue, a bazaar for the exhibition of native industry, theaters, and banks.

A., which had been wretchedly misgoverned by a long succession of Turkish deys, fell into the hands of the French in 1830 (see **ALGERIA**), who swept away every trace of the ferocious despotism that had prevailed. The Turks withdrew in great numbers to Tunis

and Alexandria Pop. in '72, 48,908. The trade of A. in 1873 in British vessels alone amounted in exports to £129,700: in imports to £140,220.

**ALGO'A BAY**, an extensive inlet at the e. extremity of the s. coast of Africa, being intersected by the parallel of Cape Town, from which it is distant about 8 degrees of longitude. Its anchorage is sheltered, excepting on the s.e., the holding-ground being excellent. It receives two rivers, the Sunday and the Baasher. At the mouth of the latter is Port Elizabeth. A. B. is the harbor of the eastern province, by far the most flourishing section of the colony; and it will ever be locally memorable as the landing-place of about 4000 souls in 1820, the first British emigration to this once Dutch possession. Since then, the trade of the bay has steadily and rapidly increased. See further, CAPE OF GOOD HOPE.

**AL'GOL**, a remarkable variable star in the constellation Perseus. It continues of the second magnitude for about 62 hours, then in three and a half hours it dwindles to the fourth magnitude, remains so for about 20 minutes, and in three and a half hours more gradually returns to its greatest brilliance, its variations being completed in about 69 hours.

**ALGO'MA**, a n.w. district of the province of Ontario, on lakes Huron and Superior; famous for mines of silver, copper, tin, iron, and for abundance of lumber. Pop. '71, 4807; chief t., Sault Ste. Marie.

**ALGONQUINS**. The A. formed the most prominent of the three aboriginal races that the French found in the great basin of the St. Lawrence. They were then the lords not merely of the best part of Canada, but of much adjacent territory to the n. and w. At the present day, the A. as well as the Hurons and Iroquois, exist, at least within the pale of settlement, only as the shadow of a mighty name, being chiefly confined to several miserable villages, with hardly anything of civilization but its individual helplessness. This deplorable result, from whatever causes it may have arisen, is certainly not to be imputed either to oppression or to indifference on the part of the French, who, politically, religiously, and socially, have always treated the red man with consideration and humanity. On this interesting subject, see further under the general head of AMERICA.

**ALGUACIL**, or **ALGUAZIL** (derived from the Arabic *Wasil*, i.e., the "power" derived from the king), is the general name in Spain of the officers intrusted with the execution of justice. There are "Alguaciles mayores," who either inherit the office of executing justice in a town as a hereditary right belonging to their families, or are chosen to the office by the municipality; formerly, the name was also given to the officers that executed the sentences or orders of tribunals, such as the tribunal of the Inquisition, and of the various orders of knights. But usually, under the name of A. is understood the "Alguaciles menores," or "ordinarios," that is to say, the attendants or officers of the courts of justice, *gens-d'armes*, bailiffs—in short, all the inferior officers of justice and police.

**ALHA'GI**. See MANNA.

**ALHA MA** (Arab. *The Bath*; the Roman *Astigia Juliensis*), a t. of Andalusia, Spain, in the province of Granada, 25 m. s.w. from Granada. Its situation is extremely picturesque, on the edge of a projecting rock, overhanging a deep chasm of limestone hills, through which the river Marchan foams, and with mountains in the background rising to a height of 8000 ft. Vineyards and gardens mingled with the houses on the steep slopes add to the interest of the scene. A. is a decayed t., although its warm sulphurous baths are still frequented by visitors in the beginning and end of summer. The Moors derived a large revenue from its baths. It was a famous fortress of the Moors; and its capture, in 1482, prepared the way for that of Granada. There are still remains of the Moorish castle and town wall. There are ruins also of a Roman aqueduct: the principal bath still in use is a Moorish edifice; and a smaller one is supposed to be Roman. Pop. 6284.

**ALHAMA**, a t. of Murcia, Spain, 17 m. s.w. from Murcia. It is celebrated for its warm mineral waters, and is resorted to for bathing. It has a ruined castle. Pop. 5200.

**ALHAMBRA** is the name given to the fortress which forms a sort of acropolis or citadel to the city of Granada, and in which stood the palace of the ancient Moorish kings of Granada. The name is a corruption of the Arabic *Kal-'at al hamra*, "the red castle." It is surrounded by a strong wall, more than a mile in circuit, and studded with towers. The towers on the n. wall, which is defended by nature, were used as residences connected with the palace. One of them contains the famous *Hall of the Ambassadors*. The remains of the moorish palace are called by the Spaniards the Casa Real. It was begun by Ibnu-l-ahmar, and continued by his successors, 1248-1348. The portions still standing are ranged round two oblong courts, one called the *Court of the Fish-pond*, the other the *Court of the Lions*. They consist of porticoes, pillared halls, cool chambers, small gardens, fountains, mosaic pavements, etc. The lightness and elegance of the columns and arches, and the richness of the ornamentation, are unsurpassed. The coloring is but little altered by time. The most characteristic parts of the Casa Real have been reproduced in the "Alhambra Court" of the crystal palace at Sydenham. A great part of the ancient palace was removed to make way for the palace begun by

Charles V., but never finished. It is long since any part of the Moorish palace was inhabited; but it is kept in a state of preservation as a work of art, and as a memorial of the tragic legend of the Abencerrages (q.v.).

**ALHAURIN EL GRANDE**, a t. of Granada, Spain, in the province of Malaga, and 19 m. w. from Malaga, on the n. side of the Sierra de Mijas, and near the Faala, an affluent of the Guadalherce. It is a well-built t., with a number of squares, wide well-paved streets, and many fountains. There are remains of a Roman aqueduct and of an Arab fortification. Many of the inhabitants are employed in working the marble, freestone, and granite quarries of the vicinity, and its lead and antimony mines. Pop. 5514.

**ALHAZEN**, or **ABU ALI AL-HASAN IBN AL-HASAN**, d. 1038: a mathematician. He declared that he could construct a machine that would regulate the inundations of the Nile, but when the caliph directed him to make it he feigned madness. A. made valuable discoveries in optics, and it was he and not Ptolemy who explained why planets appear largest when near the horizon. He also taught, in advance of Vitello, that vision does not result from the emission of rays from the eye.

**ALHONDEGA**, a fortified granary near Guanajuato, Mexico, where, in 1810, in the beginning of the revolution against Spain, the commander of the city of Mexico took refuge and was captured after severe fighting by the insurgents under Hidalgo. About 2000 were slain in the city, a single family losing 17 members; and all their houses were destroyed. When the Spaniards in the granary had exhausted their stock of cannon balls, they used quicksilver flasks—some say bags of silver dollars, also—which did terrible execution.

**ALIA**, a t. of Sicily, in the province of Palermo, 30 m. s.e. from Palermo, picturesquely situated on the crest of a hill, in a mountainous and craggy district, near a torrent called the Fiume Torto. Pop. 5425.

**A'LIAS**, at "another time" or by "another name," as Jones *alias* Smith; i.e., he calls himself by either name. An "A. writ" is one issued where one of the same kind has issued before in the same cause.

**ALIBAUD**, LOUIS, notorious for his attempt to murder king Louis-Philippe, was, at the revolution of July, quarter-master in the 15th regiment of the line. Having been degraded subsequently for an accidental brawl in the streets of Strasbourg, he demanded his discharge in 1834, and went to live at Perpignan, and then at Barcelona, where, having become a fanatical republican, he returned to Paris, with the determination to murder the king. A weariness of life had also seized him, so great, that he thought of suicide. It was on the 25th of June, 1836, at the moment that the king, when driving through the gate of the Tuileries, bowed to the national guard as they presented arms, that A. fired the well-aimed ball, which passed close by the king's head. Being immediately seized, he regretted nothing but the failure of his attempt. After a short trial he was sentenced to death, and was guillotined on the 11th of July.

**ALI-BEN-ABI-TA'LEB**, the first convert to Mohammedanism, and fourth caliph, was the bravest and most faithful follower of the prophet, whose daughter, Fatima, he married. Being made caliph in the place of the murdered Othman, he was victorious over the rebels in ninety engagements. He took prisoner Aysha, the young widow of Mohammed, and his greatest enemy, in the battle of the Camel—so called because Aysha appeared in the field riding on a camel. Ali was murdered by a fanatic in the year 660. He was buried near Kufa, where a monument was afterwards erected to him, to which his votaries still go on pilgrimage, and which caused the building of the city Medjed Ali. The religious sect formed by the followers of Ali, called Shiites (q.v.), has spread extensively under that name in Persia and Tartary. The descendants of Ali and Fatima, called the Fatimites (q.v.), although much persecuted by the Omniades, have nevertheless ruled on the banks of the Nile and of the Tagus, in West Africa and in Syria. The best edition of the proverbs or maxims ascribed to Ali has been published by Fleischer (Ali's *Hundred Proverbs, Arabian and Persian*, Leip. 1837); Ali's *Diran*, the most complete collection of his lyrical poems, mostly on religious subjects, appeared in 1840 at Bulak, near Cairo.

**ALIBERT**, JEAN LOUIS, 1766-1837; physician to Louis XVIII. and author of *Description of Diseases of the Skin*, and other useful works.

**A'LI-BEY**, 1728-73; a native of the Caucasus, and a slave when a boy. He rose to be governor of the province; intrigued for more power, but voluntarily fled from Eysin to upper Egypt. In 1766, he returned to Cairo, and, seizing the government, freed himself from the power of the sultan, coined money, and assumed the rank of sultan of Egypt. Soon afterwards he captured and plundered Mecca, and undertook to conquer all Syria. At Damascus, June 6, 1771, he routed the Turks with great slaughter and took possession of the city through his general, Mohammed; but the latter turned against him and drove him from Cairo, when A. fled to Syria, defeated the Turkish army, and captured Sidon and Jaffa. On the way to Egypt he was attacked in the desert by Murad Bey, his wife's lover and made prisoner, dying soon afterwards from wounds or poison.

**ALIBI**, Lat., signifying "elsewhere." This is a defense resorted to in criminal prosecutions, when the party accused, in order to prove that he could not have committed the crime with which he is charged, tenders evidence to the effect that he was in a different place at the time the offense was committed. When true, there can be no better proof of innocence; but as offering the readiest and most obvious opportunity for false evidence, it is always regarded with suspicion. In the case of crimes the place of committing which is immaterial—as, for example, the act of fabricating the plates, or of throwing off the spurious notes, in a case of forgery—a proof of A. is of no avail.

**ALICANTE**, chief t. of a province of the same name in Spain. The province, formed of parts of the old kingdoms of Valencia and Murcia, contains, 70,440,470 inhabitants. The t., one of the most considerable seaports of Spain, is strongly fortified, has 31,500 inhabitants, and is the staple place for the products of Valencia, especially soda, cotton and linen fabrics, ropes, corn, oil, silk, and the wine of the neighboring district, known as A. or *vino tinto*, on account of its dark color. A good deal of this rough, and at the same time sweet, wine is used to doctor thin clarets for the British market. In 1331 the t. was besieged by the Moors; and again by the French under Asfeld in 1709. In 1873, it was unsuccessfully bombarded by the Cartagena insurgents.

**ALICATA** or **LICATA**, a t. of Sicily, in the province of Girgenti, and 26 m. s.e. from Girgenti. It is most beautifully situated on the sea-coast, at the mouth of the Salsa (anc. *Himera Meridionalis*), one of the largest rivers, if not the largest, in Sicily; its buildings stretch along the shore, and occupy the steep slope of the hill, which is crested by the great old fortress, now indeed of little strength, but of imposing appearance. On the brow of a hill to the w. of the town is the dismantled castle of St. Angelo, said to occupy the site of that in which the tyrant Phalaris kept the brazen bull, his celebrated instrument of torture. A. itself is generally believed to stand on the spot where the ancient *Phintias* was built (280 B.C.) by Phintias, tyrant of Agrigentum, after he had destroyed Gela, the inhabitants of which he transferred hither. The place and immediate neighborhood were the scene of some memorable battles in the wars between the Carthaginians and Sicilians, and between the Carthaginians and Romans. In the middle ages A. suffered severely from the depredations of Barbary corsairs. It has a very bad port, the sea being so shallow that only vessels of small size can approach the town; larger vessels are compelled to anchor about a mile from the town, and are loaded and unloaded by the aid of small craft. Yet A. has a considerable trade, exporting corn, macaroni, fruit, almonds, pistachio nuts, sulphur, soda, and wines. Pop. 14,338.

**ALICE MAUD MARY**, Princess, 1843-78; second daughter of queen Victoria, princess of England, grand duchess of Hesse-Darmstadt. She was the best known and most beloved of all the queen's daughters, and became especially dear to the English during her father's fatal illness, when her name became "synonymous with a father's farewell and a mother's consolation." She was married to prince Ludwig of Hesse-Darmstadt, July 1, 1862. The young couple remained a year or more in England, and their eldest daughter, princess Victoria, was born in Windsor castle. Her married life was happy, and promised to be as fruitful as that of her mother, for at her death she left five daughters and two sons, but of the last two only the eldest is living, the other having been accidentally killed by falling from a window in May, 1873. The youngest girl died of diphtheria a few days before the mother, whose death was occasioned by the same disease. Princess A. was active in hospital work during the Franco-German war; was a constant visitor at the Alice hospital, in Darmstadt, and presided over the "Alice Frauenverein," an association of women for charitable purposes. She was zealous in many reform movements, and was a generous patron of literature and education. Her only son was sent to a kindergarten for education, and she positively stipulated that no distinction whatever was to be made or permitted between him and the other pupils. She died on the anniversary of the death of her father, when nearly all the British royal family were assembled at Windsor castle to observe the customary memorial services.

**ALIEN** (Lat. *alienus*, belonging to another, foreign). The citizen of one state, when resident in another, unless naturalized (see **NATURALIZATION**), is an alien. The condition of an alien does not necessarily result from foreign birth, for the son of a natural-born or naturalized Englishman is not an alien, wherever he may be born (4 Geo. II. c. 21, s. 1). This privilege even extends to the second generation on the father's side; and thus a man whose paternal grandfather was an Englishman, is an Englishman himself, unless either his father or grandfather be liable to the penalties of felony, have been attainted of treason, or be serving in the army of a prince at war with England, at the period of his birth (13 Geo. III. c. 21, s. 1). Neither is this privilege affected by the fact that the mothers of such persons were foreigners. The children of aliens born in England, except in the case of a hostile invasion, are natural-born subjects; but the children of English women by aliens are aliens, unless born within the British dominions. By 7 and 8 Vict. c. 66, s. 16, alien women married to natural-born subjects are naturalized. The allegiance due by an alien or stranger to the prince in whose dominions he resides, is usually called *local* or *temporary* allegiance. It differs from natural allegiance chiefly in this, that whereas natural allegiance is perpetual, and unaffected by change of residence, local allegiance ceases when the stranger transfers himself to another kingdom. See

**ALLEGIANCE.** In 1792 and 1793, in consequence of the influx of foreigners caused by the French revolution, several acts of parliament were passed, which are known by the name of the alien acts. The object of these acts was expressly to confer on the crown the power of banishing aliens from the realm; a power which there is reason to think was included in the general prerogative which the crown possesses of declaring war against the whole or any portion of the inhabitants of a foreign state. They were superseded by the peace alien act (6 Will. IV. c. 11, 1836).

Changes extending the power of aliens to hold property, were introduced by 7 and 8 Vict. c. 66, and 10 and 11 Vict. c. 83; and the whole legislation regarding aliens was revised and placed on its present footing by the naturalization act of 12th May, 1870 (33 Vict. c. 14). By this act both real and personal property of every description may now be acquired, held and disposed of, by an alien, in the same manner, in all respects, as by a natural-born British subject; and a title to real and personal property of every description may be derived from an alien, in the same manner, in all respects, as from a British subject. An alien is not qualified for any office or municipal, parliamentary, or other franchise, unless naturalized in accordance with the provisions of the act. The act does not affect any interest arising in pursuance of any disposition made before the passing of the act, or in pursuance of any devolution by law on the death of any person dying before the passing of the act. Where a convention has been entered into with a foreign state to the effect that the subjects, or citizens, of that state, who have been naturalized as British subjects, may divest themselves of such status, any person, originally a citizen of the state with which the convention exists, may make a declaration of alienage, and on so doing he shall be regarded as an alien and subject of the state to which he originally belonged. Even a British-born subject may now cease to be such, provided that, at the time of his birth, he was, and still continues to be, the subject of another state, by making a declaration of alienage. The privilege of aliens of being tried by a jury *de medietate lingue* is abolished, and it is provided that henceforth they shall be tried in the same manner as natural-born subjects. On the subject of expatriation, it is enacted, that any British subject who has at any time before, or may at any time after the passing of this act, when in a foreign state and not under any disability, voluntarily become naturalized in such state, shall thenceforth cease to be a British subject. In the case of a British subject who, before the passing of the act, has been naturalized in a foreign state, desiring to retain his British nationality, he may do so by making a declaration and taking the oath of allegiance. Whilst resident within the limits of the foreign state, however, he shall not be deemed a British subject unless he has ceased to be a subject of that state. On naturalization and the resumption of British nationality, see **NATURALIZATION**.

By the above provisions it will be seen, that in so far as Great Britain is concerned, the injustice has been obviated of a man who had been naturalized in one state being still held to his citizenship in another, and thus exposed, in the event of war, to the guilt of treason if he took part on either side. The right of merchants to reside in England, and to possess goods, money, and other personal effects, is recognized by Magna Charta (art. 48). See **CONSPIRACY BILL**.

**ALIEN** (*ante*). In the United States, an A. is a person born out of the national jurisdiction of the country, who has not been made a citizen according to law. Children of U. S. ministers, born abroad, are citizens; so are children born abroad whose father has been a citizen and resident of the United States; so are children of American parents born at sea on vessels under the flag. An A. is not subject to military or jury duty; nor, though naturalized, can he be president or vice-president of the United States. With regard to the two usual modes of acquiring property, by purchase, and by descent, an A. may acquire title by purchase, conveyance, or devise; and may hold, in the absence of restraining statutes, subject to an inquiry by the state; then if he be found legally an A., the land may be adjudged to the state. But such confiscation is rare, the occasions being generally met by special acts of legislature authorizing by his name "an alien to hold," etc. An A. can convey no better title than he possesses. In case of descent, no title passes and no inquest is necessary; so a citizen's brother may inherit from a brother though their father was an A. The drift of statutes, and especially of late legislation, is liberal towards aliens. In most states an intention to become a citizen puts the A. almost on the plane with a citizen. In taking, holding, and disposing of personal property there is no difference between the rights of an A. and of a citizen. But laws of congress prevent an A. from procuring copyrights. An A. enemy cannot make a legal contract with a citizen; such contract is unlawful from its inception; but an A. friend, resident or not, may sustain an action in our courts for invasions of personal or property rights. The act of 1798 authorizes the removal of the aliens of a country with which we may be at war; and, on the commencement of a war, the A. of the enemy loses his status in courts, and his property can be confiscated; but these statutes have never been enforced. There was once a custom of having a jury half of aliens when an A. was party to a suit, but that custom is disused.

**ALIGARH'**. See **ALLYGURH**, *ante*.

**ALIGNMENT**, a term used in military tactics, equivalent to "in line." Thus the

A. of a battalion is effected when the men are drawn up in line; the A. of a camp is a rectilinear arrangement of the tents, according to some prearranged plan.

**ALIMENT** (Lat. *alimentum*), that which feeds or nourishes. A. is not known as a technical term, in the law of England. In the law of France and in that of Scotland, it has retained the meaning which it possessed in the Roman law (*Dig.* 34, 1, 6), and signifies the food, dwelling, clothing, and other things necessary to the support of life, or such money as may be judicially demanded in lieu of them. In this sense, it is applied in Scotland to the allowance granted to a wife deserted by her husband, or whilst an action of divorce is in dependence, whether it be at his instance or at hers, to a pauper by his parish, to a prisoner for debt by his creditors, and the like. Alimentary allowances, being generally barely sufficient for the support of the recipient, and made to him in consequence of his being in want of such support, are not attachable by arrestment (q.v.).

**ALIMENTARY CANAL**, in mammalia, is that portion of the digestive apparatus through which the food passes after mastication. It is lined by a mucous membrane, which extends from the lips to the anus, being modified in each region. See **MUCOUS MEMBRANE**. The A. C. really begins at the back of the mouth, in the lower part of the bag called the pharynx, which communicates with the nostrils above, and the gullet or œsophagus below, and also with the mouth and the larynx. The pharynx is surrounded by three muscles, the constrictors, which grasp the food, and force it into the next portion of the A. C., the œsophagus. This is a tube composed of an outer layer of longitudinal muscular fibers, and an inner of circular, which extend down to, and spread out upon the stomach. These fibers, by a series of peristaltic contractions, carry the morsel of food along into the stomach. In vomiting, there is a reversal of these actions, which ruminating animals can accomplish at will. The œsophagus passes through an opening in the diaphragm, and joins the stomach, which is a pouch curved with the concavity upwards, expanded into a *cul de sac* on the left side (the cardiac extremity), and gradually narrowed to the right or pyloric end. It consists of muscular fibers continuous with those of the œsophagus, which become thicker towards the pylorus. Its external surfaces are covered by peritoneum, and it is lined by a thick soft mucous membrane, which, when the stomach is empty, lies in folds. Between the muscular and mucous layers is a fibrous layer, in which the blood-vessels lie before they pass into the mucous layer. See **STOMACH**. At its pyloric or left extremity the stomach communicates with the small intestine, which is about 20 ft. in length, becoming gradually narrow towards its lower end, and arranged in numerous convolutions, which occupy the middle of the abdominal cavity, and are kept in position by the peritoneum, which attaches them to the back of the abdomen.

The small intestine is subdivided into three parts. The first 10. in from the stomach is the duodenum, into which open the duct of the pancreas and the common bile duct: of the remainder, the *jejunum* includes about two fifths, and the *ileum*, three fifths. The differences between these last two are not visible externally, but consist in modifications of their internal structure. The tube consists of peritoneum, longitudinal and circular muscular fibers, a fibrous layer, and a mucous membrane. See **INTESTINES**, SMALL.

The ileum ends at the right iliac region in the large intestine, which is from 5 to 6 ft. in length. It begins at the pouch called the blind gut (*caput cæcum coli*) or *cul de sac* (see **CÆCUM**), which has a small worm-like appendage (*appendix vermiformis*); a double valve guards the opening of the small into the large intestine. The colon passes upwards on the right side to below the liver (ascending colon), then crosses from the right hypochondrium across the upper umbilical to the left hypochondrium (transverse colon), then descends to the left iliac fossa (descending colon), when it bends twice like an S (sigmoid flexure), and then joins the *rectum* at the left margin of the true pelvis. The colon is distinguished by its pouched or sacculated appearance, the sacs being separated by three flat bands of longitudinal muscular fibers. The peritoneum only covers it in parts. See **COLON**. The rectum is not sacculated, but its muscular coat becomes much thicker; at its lower end the longitudinal fibers stop, but the muscular become more numerous, forming the internal sphincter muscle. The rectum is not straight, but takes a curved course.

The A. C. thus consists of a continuous passage lined by mucous membrane, which rests on a fibrous and muscular basement. Its length is generally about five or six times the length of the body, or, in other words, about 30 ft. It begins below the base of the skull and passes through the thorax, abdomen, and pelvis, and consists shortly of the mouth, pharynx, œsophagus, stomach, small intestine, and large intestine. The above is the description of the A. C. in human anatomy; its parts are variously modified in different animals, as will be found in the articles on its several subdivisions.

**ALIMONY** signifies, in English law, the allowance which a married woman is entitled to receive out of her husband's estate, on separation or divorce *a mensâ et thoro*. It is generally proportioned to the rank and quality of the parties. Where the wife elopes and lives with an adulterer, the law allows her no A. By Scotch legal writers the term is sometimes used as synonymous with *aliment* (q.v.).

**ALIMONY** (*ante*). In the United States jurisdiction in A. is conferred in general on courts of equity. A. is of two sorts, *pendente lite*, and permanent. The object of the first is to enable a wife to carry on litigation with her husband, by securing her support during the pendency of suits. Should she have sufficient means of her own, no allowance would be made; the amount is fixed at the discretion of the court, and may be changed by the same authority. Permanent A. is a periodical allowance from a husband decreed to a wife as the result of litigation in her favor. If the result be against her, no allowance is made. The amount varies with the means or position of the husband, but is usually from a third to one half of his income, and is subject to change from time to time as the court finds circumstances to warrant. The court can prevent a husband from leaving the state if he means thereby to avoid payment; or the wife can enforce her claim in the federal courts, if the two are citizens of different states. In some states A. becomes a lien on the husband's real estate; or the court may compel him to give security for its prompt payment; or, in proper cases, the husband may be restrained by injunction from so disposing of his property as to place it beyond the reach of the court.

**ALI PASHA**, one of the most ferocious and unscrupulous men that even the east has produced, was descended from an Albanian pasha, who perished at the siege of Corfu in 1716. He was b. at Tepelen, a small place at the foot of the Klissoura mountains, in Albania, in 1741. His mother was a vindictive and merciless woman, who never hesitated to employ the most revolting means of accomplishing her purposes. Having lost his father, a comparatively quiet and enlightened man, his education necessarily devolved upon her; and she did not fail to inspire him with the same remorseless sentiments that animated herself. His youth was passed in extreme peril and hardship, for the neighboring pashas combining, had robbed his father of nearly all his possessions, in the effort to recover which, young Ali was repeatedly defeated, and at last had to betake himself to the mountains, and even to pledge his sword to save himself from dying of hunger. These calamities were not calculated to soften the native ferocity of his disposition; they only nurtured a mingled boldness and cunning, which afterwards developed itself in a variety of qualities, such as subtlety, dissimulation, foresight, treachery, vigor, and diabolical cruelty. It is said that the change in his fortune arose from his having accidentally discovered a chest of gold, with which he raised an army of 2000 men, gained his first victory and entered Tepelon in triumph. On the very day of his return, he murdered his brother; and then imprisoned his mother in the harem on the charge of poisoning him, where she soon after died. He next reconciled himself to the porte by helping to subdue the rebellious vizier of Scutari; and thus acquired not only the lands that had been wrested from his father, but likewise several Greek cities. He also attacked and slew (with the permission of the sultan) Selim, pasha of Delvino, and, as a reward, was appointed lieutenant to the new pasha of Derwend; but instead of attending to the security of the high-roads (which was his office), he rendered them more insecure than ever, by participating in the plunder which the *klephtis* (robbers) were allowed to make. The result was, his deposition by the porte; but he speedily purchased back its favor, for he was a master-hand at bribery. Shortly after this, he acquired a high reputation as a soldier, and did such good service to the Turks in their Austro-Russian war of 1787, that he was named pasha of Trikala in Thessaly; at the same time he seized Janina or Joannina, of which he got himself appointed pasha by the instrumentality of terror, a forged firman, and bribery. It must be admitted that, as a ruler, he now displayed many excellent qualities. He swept his old friends, the robbers, from the mountain-roads, incorporated them into military troops, quelled the wretched factions that prevailed, and everywhere introduced order in the place of anarchy by the vigor and vigilance of his administration.

A short time after this, he entered into an alliance with Napoleon Bonaparte, who sent him engineers. When Bonaparte was defeated in Egypt, Ali, in 1798, took the places in Albania possessed by the French. After a three years' war, he subdued the Suliotes, for which the porte promoted him to be governor of Romania. About this time, he revenged upon the inhabitants of Gardiki an injury done to his mother 40 years before, by the murder of 739 male descendants of the original offenders, who themselves were all dead.

In the interior of his dominions, Ali maintained the strictest order and justice. Security and peace reigned, high-roads were constructed, and industry flourished, so that the European travelers, with whom he willingly held intercourse, considered him an active and intelligent governor. From the year 1807, when he once more entered into an alliance with Napoleon, the dependence of Ali on the porte was merely nominal. Having failed, however, in his principal object, which was to obtain, at the peace of Tilsit, through the influence of Napoleon, Parga, on the coast of Albania, and the Ionian islands, he now entered into an alliance with the English, to whom he made many concessions. In return for these, they granted Parga, nominally to the sultan, but really to Ali. As he now considered his power to be securely established, he caused the commanders of the Greek *armatoles* (or Greek militia), who had hitherto given him assistance, to be privately assassinated one by one, while at the same time he put to death the assassins, to save himself from the suspicion of having been their instigator.

The porte at length determined to put an end to the power of this daring rebel; and in 1820, sultan Mahmoud sentenced him to be deposed. Ali resisted for a time several pashas that were sent against him; but at last surrendered, on the security of an oath that his life and property would be granted him. Regardless of this, he was put to death, Feb. 5, 1822. Ali possessed, indisputably, great natural gifts, but along with them a character of the worst description. He never scrupled to use any means, provided it speedily secured his end. Yet we can hardly help admiring the singular talent which he invariably displayed. Like many other half-civilized monarchs and chiefs who have lived within the sphere of European influence, he was keenly alive to whatever transpired among the powers of Christendom. Though utterly illiterate himself, he had all the foreign journals translated and read to him. He watched every political change, as if conscious that the interests of his little region depended for their future prosperity on the west, and not on the east; and made friendly advances to both the French and the English, recognizing, with a sagacity remarkable in a barbarian, that the practical dominion of the world had passed from the crescent to the cross.

**ALiquot PART.** One quantity or number is said to be an A. P. of another, when it is contained in this other an exact number of times without remainder. Thus 2,  $2\frac{1}{2}$ , 4, and 5 are A. parts of 20, being contained in it 10, 8, 5, and 4 times. The consideration of A. parts occurs chiefly in the rule of *Practice*. Suppose we have to find the price of a number of articles at  $6\frac{1}{2}d.$ : since  $\frac{1}{2}d.$  is the 8th part of  $6d.$ , to the price at  $6d.$  (which is found at once in shillings, by taking half the number of articles) add  $\frac{1}{8}$  of that price.

**ALISMA CEEÆ**, a natural order of monocotyledonous plants, consisting of herbaceous plants either floating in water or growing in swamps. The leaves have parallel veins, even if expanded into a broad blade. The flowers are in umbels, racemes, or panicles; the sepals 3, the petals 3, the number of stamens definite or indefinite. The ovaries are several, superior, one-celled, distinct or united; the styles and stigmas equal to them in number. The fruit is dry, with one or two seeds in each carpel; the seeds exalbuminous.—There are about 50 known species, excluding the natural order JUNCAGINEÆ, which is very nearly allied, and is included in this by some botanists. The species of both orders are chiefly natives of the northern parts of the world. **WATER PLANTAIN** (*Alisma plantago*) is a very common plant in stagnant waters in Britain, and is not destitute of beauty. Its leaves, which have long footstalks, shoot up above the water, and amongst them but far above them rises the erect scape or leafless stem, dividing into slender whorled branches and branchlets, among which the little flowers appear to lie thinly scattered. The fleshy rhizome, or root-stock, is eaten by the Calmucks, after it has been deprived of its acidity by drying. The corns of the **ARROWHEAD** (*sagittaria*) possess somewhat similar properties. See **ARROWHEAD**.

**ALISON**, Rev. ARCHIBALD, was b. in Edinburgh in 1757. He studied at the university of Glasgow, and afterwards at Oxford. He took orders in the church of England in 1784, and subsequently held several preferments, among others a prebendal stall in Salisbury, and the perpetual curacy of Kenley, in Shropshire. From 1800, Mr. A. ceased to reside in England, and officiated in a chapel in his native city, where he d. in 1839. A. is principally known by his *Essays on the Nature and Principles of Taste*, first published in 1790. The second edition, in 1811, gave occasion to an article by Jeffrey, in the *Edinburgh Review*, which brought the book more before the public. It has since gone through several editions, and been translated into German and French. The *Essays* advocate what is called the "association" theory of the sublime and beautiful, and are distinguished for their pleasing and elegant style, and the fine feeling that pervades them. See **ESTHETICS**.

**ALISON**, Sir ARCHIBALD, Bart., b. at Kenley, Shropshire, in 1792, was the younger son of the Rev. Archibald A., author of the *Essays on the Nature and Principles of Taste*. His mother was Dorothea Gregory, daughter of Dr. John Gregory of Edinburgh. In 1800, his father removed to the Scottish metropolis, where he had accepted the senior charge in the Episcopal chapel in the Cowgate, and thus A. had the advantage of studying in a city then, as now, distinguished for its politeness and learning. At Edinburgh university he obtained the highest honors in Greek and mathematics. After he had finished his curriculum, he became a member of the Scottish bar in 1814, but spent a considerable number of years on the continent, before devoting himself to legal avocations. In 1822, he was named advocate-depute, which office he held till 1830. He now began to appear as a writer on law, politics, and literature. His *Principles of the Criminal Law of Scotland*, published at Edinburgh in 1832, is considered a standard authority on the subject. In the following year he published a sequel to the work, entitled *The Practice of the Criminal Law*. In 1834, he was appointed sheriff of Lanarkshire, by Sir Robert Peel; in 1845, the students of Aberdeen elected him "lord rector" of Marischal college; in 1851, he received the same honor from Glasgow university, and subsequently the title of D.C.L. from the university of Oxford. He received a baronetcy in 1852. His great work is undoubtedly *The History of Europe during the French Revolution* (10 vols. 8vo, 1839-42), which narrates the events from 1789 to 1815; a continuation, under the title of *The History of Europe from the Fall of Napoleon to the Accession of Louis Napoleon* (9 vols.), was finished in 1859. He also published a *Life of the Duke of Marlborough*, *The Principles of Population*, etc., *Free Trade and Protection, England in 1815 and 1845*,

besides contributing for many years to *Blackwood's Magazine* a series of tedious articles on tory politics. It is very difficult to characterize Sir A. A.'s *magnum opus*, *The History of Europe*. Although a work of immense industry, of very respectable accuracy, written with great animation and tolerable candor, it has failed to impress critics with a high idea of Sir A. A.'s abilities. The style is at times excessively wordy, and even when animated it is never picturesque. Neither has he much insight into events or characters. Nevertheless, as his work supplied a felt want, and is sufficiently entertaining for a large class of readers, it met with an excessive popularity. It has gone through numerous editions, and has been translated into German, French, Arabic, and other languages. A. d. May, 1867.

**ALISON**, WILLIAM PULTNEY, M.D., political economist, physician, and professor of the practice of medicine in the university of Edinburgh, from which last office, however, he retired in 1855, was an elder brother of the historian. He was extremely popular with all classes of the community, from the amiable and humane disposition which he invariably showed in his efforts to alleviate the sufferings of the poor. A pamphlet published by Dr. A., in 1840, to show how the inadequate provision for the poor in Scotland led to desolating epidemics, was the principal means of bringing about an improved poor-law for that country. His other writings are—*Outlines of Physiology*, and *Outlines of Pathology and Practice of Medicine*. In a work published at Edinburgh in 1850, entitled a *Dissertation on the Reclamation of Waste Lands*, he fully examines the subject, and recommends the colonization of these by paupers and criminals. He d. Sept., 1859.

**ALI WAL'**, a village near the southern bank of the Sutlej, and not far from the town of Loodiana, in lat.  $30^{\circ} 57'$  n. long.  $75^{\circ} 36'$  e. It was the scene of a fierce conflict between the British and Sikh forces on the 28th of Jan., 1846. The latter having crossed the river for the purpose of foraging, or otherwise obtaining supplies, had threatened Loodiana, when they were attacked by Sir Harry Smith, defeated, and driven back with great slaughter. The victory of A. is said by good judges to have been "without a fault."

**ALIZARINE**, the coloring matter of madder. It may be obtained by subliming on paper an alcoholic extract of madder, or by exhausting the root with water, precipitating with sulphuric acid, dissolving the precipitate in a solution of chloride of alumina, and separating the impure A. by the addition of hydrochloric acid. The impure A. is dissolved in alcohol, and separates as a lake on treating with hydrate of alumina, which is now boiled with carbonate of soda to separate another coloring matter called purpurine, and is finally treated with hydrochloric acid, which dissolves the alumina and leaves the pure substance. A. in the anhydrous state forms red prisms, and in the hydrate condition crystals like mosaic gold. It dissolves sparingly in water, even at the boiling point, but is soluble in alcohol or ether. Mineral acids do not decompose the coloring matter at ordinary temperatures. Caustic alkalies, or alkaline carbonates, dissolve A., forming deep purple solutions. A. has the atomic composition  $C_{11}H_8O_4$ , and has recently been made synthetically from the hydrocarbon  $C_{14}H_{10}$ , called anthracene, which occurs among the products of the destructive distillation of coal, and is the first example of the artificial formation of a natural coloring matter.

**AL'KAHEST**, or **ALCAHEST**, the universal solvent of the alchemists. See **ALCHEMY**.

**ALKALIES**. The word *alkali* is of Arabic origin, *kali* being the name of the plant from the ashes of which an alkaline substance was first procured. The name now denotes a class of substances having similar properties. The alkalies proper are four in number—potash, soda, lithia, and ammonia. The first three are oxides of metals; the last is a compound of nitrogen, hydrogen, and oxygen, and, being in the form of a gas, is called the volatile alkali. Potash being largely present in the ashes of plants, is called the vegetable alkali; and soda, predominating in the mineral kingdom, is designated the mineral alkali. The *alkaline earths*, as they are called—lime, magnesia, baryta, and strontia—are distinguished from the former by their carbonates not being soluble in water. The distinguishing property of alkalies is that of turning vegetable blues green, and vegetable yellows reddish brown. Blues reddened by an acid are restored by an alkali. The alkalies have great affinity for acids, and combine with them, forming salts, in which the peculiar qualities of both alkali and acid are generally destroyed; hence they are said to neutralize one another. In a pure state alkalies are extremely caustic, and act as corrosive poisons. Combined with carbonic acid, especially as bicarbonates, they are used to correct acidity in the stomach; but the injudicious and continued use of them is attended with great evil.

**ALKALIMETER**. Commercial potash and soda always contain greater or less quantities of foreign substances, such as sulphate of potash, common salt, silicates, oxide of iron, water, etc., which diminish the percentage of real alkali in a given weight. It is important, then, for the manufacturer to have some simple and ready means of determining the proportion of pure carbonate of potash or soda contained in any sample, that he may be able to judge of its value. Ordinary chemical analysis takes too much time. The A. serves this purpose. It consists of a graduated glass tube, filled with diluted sulphuric acid, and containing as much absolute sulphuric acid as would neutralize a given weight, say 100 grains, of carbonate of potash; 100 grains of the article to be judged of is then dissolved in water, and as much acid is gradually added to it from

the tube as to neutralize the solution, that is, take up all the alkali. The application of colored tests determines when the neutralization is complete. The purer the article, the more of the acid will be required; and if the tube, which is divided into 100 degrees, has been emptied to the 80°, the impure article contains 80 per cent of pure carbonate of potash.

This method of determining the strength of alkalies is called the *alkalimetry process*; but the instrument is not confined in its use to the estimation of the strength of alkaline substances. It is likewise employed in the determination of the strength of acids, such as sulphuric acid, hydrochloric acid, nitric acid, and acetic acid (vinegar). For this end, the graduated instrument is charged with a solution of an alkali of known strength, such as a given weight of crystallized carbonate of soda (washing soda), dissolved in water, and according to the number of divisions of the liquid poured from the A., the strength of the acid into which the alkaline liquid has been decanted, is calculated. The latter application of this instrument is called *acidimetry*. Again, the same graduated glass tube has been recently employed in many other ways, such as the determination of the strength of a solution of silver, by charging the instrument with a known or standard solution of common salt; and for this purpose it is used largely by the assayers to the royal mint, and other metallurgic chemists. This mode of analysis is every day becoming of more and more importance, and, in fact, has given rise to a new department of analytical chemistry, which has been designated *volumetric analysis*.

**ALKALOIDS** form an important class of substances discovered by modern chemistry. They are divided into two classes—namely, *natural* and *artificial*. The natural A. are found in plants and animals, and are often designated *organic bases*. Those obtained from plants are likewise called *vegeto-alkalies*. They are composed essentially of carbon, hydrogen, and nitrogen; besides which, the greater number contain oxygen. The A. have generally an energetic action on the animal system, and hence are every day employed in small doses as medicine; whilst in comparatively large doses they are powerful poisons. They have, although in low a degree, the characteristic alkaline properties on vegetable colors, etc.; have generally a bitter acrid taste; and form the active principles of the plants in which they are found. Such are morphia, codeine, and narcotine, found in opium; quinine and chinconine, in cinchona bark; strychnine, in nux-vomica; hyoscyamine, in henbane; nicotine, in tobacco; piperine, in black pepper; caffeine or theine, in coffee and tea, etc.

The animal A. are few in number, the more important being urea, found in the urine of the mammalia; and kreatine and kreatinine, two of the constituents of the juice of flesh. The artificial A. are those organic bases which are not found in any known plant or animal, but of which the later researches of chemists have contrived to form a large number. As the artificial A. do not differ essentially from the natural A. in composition, structure, or properties, it is confidently believed that the day is not far distant when all of the A. will be prepared artificially; indeed, recently several of the natural A. have been manufactured on the small scale without the intervention of the living plant or animal. For instance, urea can be formed from the simplest form of dead organic nitrogenous matter.

**ALKANET** (*anchusa*), a genus of plants belonging to the natural order *boraginæ*, and having a 5-partite calyx, a funnel-shaped or salver-shaped corolla, with five scales closing its mouth, five stamens, an obtuse stigma, and ovate achenia, which are surrounded at the base by a plaited tumid ring. The species are herbaceous plants, rough with stiff hairs, and having lanceolate or elonga to-ovate leaves, and spike-like, bracteated, lateral, and terminal racemes of flowers, which very much resemble those of the species of *myosotis*, or forget-me-not.—The COMMON A. (*A. officinalis*) grows in dry and sandy places, and by waysides, in the middle and n. of Europe. It is rare and a very doubtful native in Britain. The flowers are of a deep purple color. The roots, leaves, and flowers were formerly used in medicine as an emollient, cooling, and soothing application.—The EVERGREEN A. (*A. sempervirens*) is also a native of Europe, and a doubtful native of Britain, although not uncommon in situations to which it may have escaped from gardens, being often cultivated for the sake of its beautiful blue flowers, which appear early in the season, and for its leaves, which retain a pleasing verdure all winter. It is a plant of humble growth, rising only a few inches above the ground.—A number of other species are occasionally seen in our flower-borders.—*A. tinctoria*, to which the name A. or ALKANNA (Arab. *al-chenneh*) more strictly belongs, is a native of the Levant and of the s. of Europe, extending as far n. as Hungary. The root is sold under the name of A. or alkannaroot; it is sometimes cultivated in England; but the greater part is imported from the Levant or the s. of France. It appears in commerce in pieces of the thickness of a quill or of the finger, the rind blackish externally, but internally of a beautiful dark-red color, and adhering rather loosely to the whitish heart. It contains chiefly a resinous red coloring matter, called *alkanna red*, *anchusic acid*, or *anchusine*. The color which it yields is very beautiful, although not very durable. It is readily soluble in oils, and is therefore in very general use amongst perfumers for coloring oils, soaps, pomades, lip-salves, etc. It is extensively used for coloring spurious port-wine. It also enters into compositions for rubbing and giving color to furniture. Its solutions in oils and alcohol have almost a carmine red color, although to water it gives

only a brownish hue. It combines with alkalies, forming blue solutions; with chloride of tin, it becomes of a carmine red; with acetate of lead, blue; with sulphate of iron, dark violet; with alum, purple; and with acetate of alumina, violet.—*VIRGINIAN A.* (*A. Virginica*) yields a similar coloring-matter, and is used in the same way.

**ALKANNA** (*al-henna*) is also a name given to a coloring-matter prepared from the leaves of *Lawsontia inermis*, and used by oriental ladies to give a red color to their nails. See *HENNA*.

**AL-KIN'DI**, **ABU YUSUF**, lived in the first half of the 10th c., called "The Philosopher of the Arabs;" author of more than 200 works on philosophy in general, logic, politics, ethics, arithmetic (under which he discusses the unity of God), spherology, theory of music, astronomy, meteorology, geometry, cosmology, astrology, medicine, and various arts, besides controversial writings. Only those in astrology and medicine remain. He was one of the earliest translators and commentators of Aristotle, and his name marks the first philosophical revolt against Islamism.

**ALKMAAR'**, an old t. in the province of North Holland, in the Netherlands, situated on the Helder canal, 20 m. n.n.w. of Amsterdam, in lat. 52° 38' n., long. 4° 43' e.; pop. '76, 12,245. It is well built, has very clean streets, and is intersected by broad canals. It possesses a town-house, ornamented with curious gothic carving. The inhabitants support themselves by important manufactures of sail-cloth, sea-salt, etc., as well as by trade in grain, butter, and cheese. A. is said to export more of the last mentioned commodity than any other town in the world; 9,000,000 lbs. annually is the quantity specified. It is the birthplace of Henry of A. See *REINEKE FUCHS*. Here, on Oct. 18, 1799, the duke of York signed a not very honorable capitulation, after his Russo-British army had been twice defeated by the French gen. Brune.

**ALKMAAR'**, **HEINRICH VON**, a German writer, lived in the latter half of the 15th c. He was the translator of the famous satirical historical poem, *Reineke de Voss* (Reynard the fox), which he declared that he took from the Walsch language, now supposed to be the Walloon. He was tutor of the duke of Lorraine, and little is known of his history. Some have thought A. to be a pseudonym.

**AL LA BREVE**. In old music, the breve,  $\equiv$ , as the longest note, was equivalent to our semi-breve,  $\simeq$ , the longest note commonly used in modern music. Consequently, the minims anciently used were equivalent to our crotchets. Music written with four minims in a bar is signed *alla breve*, which implies that the four minims must be sung as four crotchets. The difference between the two styles of writing is merely formal. Other signs for A. B. time are— $\frac{2}{4}$ ,  $\frac{3}{4}$ , or  $\frac{4}{4}$ , or *alla capella*.

**ALLAH** (compounded of the article *al* and *ilah*—i.e., "the worthy to be adored") is the Arabic name of the one God, to whose worship Mohammed pledged his followers; and the word has passed into all languages wherever the name of Islam has been heard. The notions of the character of this God given by Mohammed in the Koran bear manifest traces of Jewish and Christian influence, and are much superior to the national superstitions and impassioned fancies of the orientals in general. Above all other things, Mohammed inculcated the unity of God in the strictest sense, in opposition not only to idolatry, but also in some points to the belief of the Jews and Christians, as is seen in the following formula or creed: "There is no God but the God (Allah). This only true, great, and highest God has his existence of himself, is eternal, *not begotten*, and *begets not*, suffices for himself, fills the universe with his infinity, is the center in whom all things unite, manifest and concealed, Lord of the corporeal and spiritual worlds, creator and ruler, almighty, all-wise, all-good, merciful, and his decrees are irrevocable." Mohammed has ventured on very bold illustrations of these attributes for popular representation, as in the passage of the Koran where he says: "If all the trees on earth were pens, and if there were seven oceans full of ink, they would not suffice to describe the wonders of the Almighty." The different attributes of God, divided under his 99 names, and connected together in a certain order in a litany, form the rosary of the Mohammedans, which concludes with the name A., as the hundredth, including in itself all the former epithets.

**ALLAHABAD'**, a British district in the n.w. provinces of India, between lat. 24° 49', 25° 44'; long. 81° 14', 82° 26'. It is 85 m. in length by 50 in breadth—area, 2765 sq.m. The surface of the country is in general level, with a slope towards the s.e. The principal rivers are the Ganges (flowing partly within it, and partly dividing it from Oude and Mirzapore), and its great affluent the Jumna, which joins it at the city of A. The district is well watered, and vegetation is luxuriant. The native agriculture at the end of the last century was singularly rude and deficient, but the efforts of British residents have done much for its improvement. The principal products of the district are cotton and salt; and there is a brisk transit trade by the Jumna in cotton, indigo, and sugar. The population in 1871 was 1,394,245, chiefly agricultural, about 100,000 being Mohammedans and others not Hindoos. The four principal towns are Allahabad, Shahzadpore, Bhugaisur, and Adampore.—The province or "division" of A. comprehends the districts of Cawnpore, Futtehpur, Humeerpore, and Calpee, Banda, and A. It is bounded n. by Oude and Agra, e. by Behar, s. by Gundwana, and w. by Malwa. Its

length is about 270 m.; breadth, 120; area, 13,574 sq.m.; pop. 5,466,116. It comprises one of the most populous and productive territories in India.

**ALLAHABAD** ("city of God"), the seat of the government of the n.w. provinces of British India, occupies the fork of the Ganges and Jumna, lat. 25° 26' n., long. 81° 85' e., thus forming the lowest extremity of the extensive region which, as lying between these natural boundaries, is distinguished as the *Doab*, or the country of *Two Rivers*—an analogous term to the *Punjab*, or the country of *Five Rivers*. The situation of A., at the confluence of the holy streams of India, besides giving the city its sacred appellation, has rendered it a much frequented place of pilgrimage for the purposes of ablution, some of the devotees sinking themselves with weights to rise no more. In point of appearance, A. was scarcely worthy of its character and renown. With the exception of a few ancient monuments of costly, elaborate, and tasteful workmanship, the native part of the city consists of mean houses and narrow streets. As in the towns generally of India, the European quarter, on the whole, is vastly superior. Its nucleus appears to have been the native fort, which, on the e. and s., rises directly from the banks of both rivers, while towards the land its artificial defenses, of great strength in themselves, are not commanded from the neighborhood by any higher ground. This citadel, described by Herber as having been at one time "a very noble castle," has lost much of its romance by having had its lofty towers pruned down to bastions and cavaliers. The Europeans of the garrison occupy well-constructed barracks. Beyond the fort are the cantonments for the native troops. In connection with these are numerous villas and bungalows, few other spots in India boasting such handsome buildings of this kind; and these showy retreats are rendered still more attractive and agreeable by avenues of trees, which wind between them, and connect them with the fort, the city, and several of the circumjacent localities.

The summer of 1857 brought disaster to A. On the 6th of June of that year, the insurrection, which had begun at Meerut on 10th May, extended itself to A. Though the Europeans continued to hold the fort, yet the mutineers were, for some days, undisputed masters of all beyond; and between the ravages of the marauders and the fire of the garrison, the city soon became little better than a heap of blackened ruins. In the history of this fearful outbreak, A. must be "a magic word" to every English ear, as the spot where the fiery Neill entered on his brief career of glory. It was here also that Lord Canning, after the close of the mutiny, distributed three millions sterling in presents to the chiefs who had remained loyal. But although situated thus in the heart of the outbreak, and feeling its disastrous effects, the city possesses natural advantages that have allowed it to recover. Its position at the confluence of the holy rivers, which has so long made it a center of superstitious reverence and worship, now renders it naturally a center of commerce and civilization, and has been fully appreciated by government. It commands the navigation both of the Ganges and of the Jumna. It is on the direct water-route between Calcutta and the upper provinces; and is a main station, not only on the Grand Trunk road, but also on the East Indian railway. New buildings, many of them possessing great architectural merits, have accordingly sprung up with rapidity since 1857; the most noteworthy buildings being still, however, the great mosque and the Sultan Khosrow's caravanserai—a fine cloistered quadrangle. The fort is of red stone, and is approached by a very handsome gate; it contains the palace or residency, and the Gada pillar or club of Bhin Sen, in the Challee Satoom temple, which is said to communicate with Benares by a subterranean passage, through which flows a third holy river, the Sereswati, visible only to the eye of faith. A. possesses a college, a hospital, theaters, bazaars, etc. The inhabitants number (1872) 143,693. So many poor pilgrims throng the city, especially at the time of the great fair, which is held once every twelve years, that instead of Allahabad, the natives call it "Fakirabad," or the city of beggars. The cotton, sugar, and indigo produce of the fertile district of A. is brought in large quantities into the city, to be transported thence to Calcutta and elsewhere. Steamers sail to Calcutta and barges to Delhi. A. is distant from Calcutta, by land, 496 m.; by water, 808 m. in the rainy season; by water, 985 m. in the dry season. From Delhi it is distant 386 m.; and from Bombay by the Jubbulpore branch of the East Indian railway, 840 m.

**ALLAMAKEE**, a co. in n.e. Iowa; 667 sq.m.; pop. '80, 19,791. It is fertile and well timbered; agriculture is the chief business. Co. seat, Lansing.

**ALLAMAND**, JEAN NICHOLAS SÉBASTIEN, 1713-87; a Dutch philosopher and professor of natural history at Leyden. He did good service to science in translating Buffon's and other works, collecting plants, and investigating electricity. He was a member of the British royal society.

**ALLAMANDA**, a genus of plants of the natural order *apocynaceæ* (q.v.), distinguished by a 5-parted calyx without glands, a funnel-shaped corolla with its limb campanulate, and the fruit a prickly capsule. *A. cathartica*, a native of the West Indies, is a shrub with whorled or opposite oblong leaves, and large yellow flowers on many-flowered footstalks. It has violently emetic and purgative properties; but in small doses, an infusion of the leaves is esteemed a valuable cathartic medicine, especially in the cure of painter's colic. All the species are natives of the tropical parts of America.

**ALLAN, BRIDGE OF**, a beautiful village, consisting chiefly of lodging-houses, lying within the shelter of a spur of the Ochils, on the road from Stirling to Perth, from the former of which towns it is only three m. distant. It is situated on the banks of the Allan, which, like the heights behind the place, are richly wooded. It owes its prosperity partly to its mineral (saline) wells, and partly to its sheltered situation and mild climate, which render it a favorable resort of invalids, especially in spring and autumn. There are excellent hotels, and abundance of good lodgings. Pop. of 1871, 3055.

**ALLAN, DAVID**, a distinguished Scottish painter of domestic subjects, in which he was the forerunner of Wilkie, was b. at Alloa in 1744. In 1755, he entered the academy for drawing, painting, and engraving, established in Glasgow by the celebrated printer Foulis, where he studied for seven years. The liberality of friends enabled him, in 1764, to go to Rome, where he resided for 16 years. In 1773, he gained the gold medal given by the academy of St. Luke for the best historical composition. The subject was the "Origin of Painting," the old legend of the Corinthian maid who drew her lover's profile from the shadow. This picture, the highest effort of Allan's powers, was engraved by Cunego. Of his other pictures executed at Rome, the best known are four humorous pieces illustrating the carnival, which were engraved by Paul Sandby. In 1777, A. came to London, where he painted portraits; after a year or two, he removed to Edinburgh; and in 1786, succeeded Runciman at the head of the art academy established there by the board of manufacturers. His works subsequent to this date were chiefly of a humorous description, and illustrative of Scottish domestic life. His illustrations of Allan Ramsay's *Gentle Shepherd* became very popular, but are of no great merit. A. died at Edinburgh in 1796. "His merits," says Allan Cunningham, "are of a limited nature; he neither excelled in fine drawing nor in harmonious coloring; and grace and grandeur were beyond his reach. His genius lay in expression, especially in grave humor and open drollery."

**ALLAN, Sir WILLIAM**, a distinguished Scottish historical painter, was b. in Edinburgh in 1782. He was educated at the high school; and having early displayed a taste for drawing, was entered as a pupil in the school of design connected with the royal institution, with the intention of becoming a coach-painter. Among his fellow-students and friends were David Wilkie, John Burnet, and others who afterwards rose to eminence. He subsequently studied for some time at the royal academy of London. Finding difficulties in the way of professional advancement in the metropolis, he determined to go abroad; and in 1805, set out for St. Petersburg, where the friendly interest of his countryman, Sir Alexander Crichton, the imperial family physician, soon procured him employment. In the Russian capital he spent several years, diligently pursuing his professional labors, and making occasional tours to the s. of Russia, the Crimea, Turkey, and Circassia, where he made numerous sketches, some of which supplied the materials of his best known works. In 1814, he returned to Edinburgh, and soon after exhibited his "Circassian Captives," a large picture, distinguished by the picturesqueness of the subject and the elaborate fidelity and spirit of its treatment. He had exhibited several pictures before this, but not till now was his reputation as an artist fairly established. The remuneration of his labors, however, was not so ready as the public acknowledgment of their worth. The purchase of two of his pictures by the grand duke Nicholas, afterwards emperor, when on a visit to Edinburgh, contributed in no small degree to promote the sale of his works. A severe attack of ophthalmia obliged him for a time to suspend his exertions. He employed his leisure in visiting Italy, Turkey, Greece, and Asia Minor. On returning home he resumed his brush, and for many years labored with great assiduity. In 1826, he was elected an associate of the London academy; in 1835, an academician. In 1838, on the death of Mr. George Watson, the royal Scottish academy elected him as its president, and on the death of Sir David Wilkie in 1841, he was appointed limner to her majesty for Scotland. He was at the same time knighted. At intervals he made excursions into the continent, visiting Spain and Morocco in 1834, St. Petersburg in 1841, and Germany and Belgium in 1847. At St. Petersburg, he received a commission from the emperor to paint a large picture of "Peter the Great teaching Shipbuilding to his Subjects;" it was exhibited at London in 1845, and is now in the imperial winter palace. For some time before his death, he had been diligently working at a great picture of "Bruce at Bannockburn." He died in his painting-room, to which his bed had been removed, on the 22d of Feb., 1850. The great merits of Sir W. A. as a painter consist in his conscientious fidelity, his skill in composition, and the dramatic force of his representations. The impulse contributed by him to historical painting, especially of national subjects, entitles him to a very high place in the history of Scottish art. Among his chief works, many of which are well known through engravings, are—"John Knox admonishing Queen Mary," 1823; "Queen Mary signing her Abdication," 1824; "Death of the Regent Moray," 1825; "Polish Exiles," 1834; "The Slave-market at Constantinople," 1837; "Battle of Prestonpans," 1842; "Waterloo," two pictures, from the French and English positions, the first of which was bought by the duke of Wellington.

**ALLAN TOIS**, a delicate membranous bag, which makes its appearance in the eggs of birds during incubation, and is a provision chiefly for the aëration of the blood of the embryo or chick. It sprouts from the lower part of the intestine of the chick, and rapidly

enlarges, so as almost completely to inclose it, lining nearly the whole extent of the *membrana putaminis*—the double membrane which is immediately within the egg-shell. It is covered with a net-work of arteries and veins, corresponding to the umbilical artery and vein of mammalia; and the aëration of the blood is accomplished by the air which enters through the pores of the shell; but as the lungs become capable of their function, the circulation in the A. diminishes, and its footstalk contracts, and at last divides, leaving only a ligamentous remnant. The A. is never developed in the eggs of fishes and amphibians, hence these are called anallantoid vertebrates; while reptiles, birds, and mammalia, in which it is present, are called allantoid. In the mammalia, it is superseded at an early period of foetal life by other contrivances, but continues to exist in the lower animals for receiving the urinary secretion through the urachus, a purpose which it serves in birds and reptiles likewise. In the human species, it disappears very early, only a minute vesicle remaining.

**ALLARD**, generalissimo of the army of Lahore, and previously adjutant to marshal Brune under Napoleon, was b. in 1783. After the murder of marshal Brune (q.v.), A. left France (1815), intending to emigrate to America; but changed his plan, entered into the service of Abbas-Mirza of Persia, and afterwards went to Lahore (1820), where he engaged in the service of Runjeet Singh (q.v.), by whom he was made generalissimo, and whose forces he organized and trained in the European modes of warfare. Having married a native of Lahore, he identified himself with the interests of his adopted country, but could not entirely forget France. The July revolution brought him back to Paris, where he was received with distinction, and was made French *chargé d'affaires* in Lahore. He presented to the royal library of Paris a valuable collection of coins, and returned to Lahore (1836), leaving his wife and children in Paris. In the subsequent battles of Runjeet Singh with the Afghans, A. repeatedly distinguished himself, and died at Peshawur, Jan. 23, 1839. His remains were, according to his own wish, buried with military honors at Lahore.

**ALLEGAN**, a co. in w. Michigan, on lake Michigan; 840 sq.m.; pop. '70, 32,105. A navigable river, the Kalamazoo, flows through it, and several railways intersect it. The soil is fertile, lumber is produced, and brick and carriages are made. Co. seat, Allegan.

**ALLEGANY**, a co. in w.s.w. New York, on the Pennsylvania border; intersected by Genesee river and New York and Erie railroad; 1033 sq.m.; pop. '80, 42,007. Bog ore and limestone are found; cattle, wool, hay, and grain are produced; leather, lumber, flour, etc., manufactured. Co. seat, Angelica.

**ALLEGANY**, a co. in the extreme n.w. of Maryland; 800 sq.m.; pop. '70, 38,536—1166 colored. The Potomac river is on the s.; the Alleghany mountains occupy part of the co. Bituminous coal, limestone, and iron ore are found; dairy produce, lumber, leather, hydraulic cement, and fire-brick are produced. There is abundant water-power. Co. seat, Cumberland.

**ALLEGHANIES**, a name perhaps originally limited to the mountain-cradle of the river next mentioned, but often popularly extended to the whole chain, otherwise called the Appalachians (q.v.).

**ALLEGHANY**, a co. in n.w. North Carolina; 300 sq.m.; pop. '70, 3691—290 colored. It is in the Alleghany mountains, and the region is noted for copper ore. Co. seat, Gap Civil.

**ALLEGHANY**, a co. in n.w. Virginia, drained by Jackson river, one of the heads of the James; 500 sq.m.; pop. '70, 3674—579 colored. The Chesapeake and Ohio railroad, and the James river canal connect it with the seaboard. Tobacco, grain, and wool are raised. There are valuable mineral springs. Co. seat, Covington.

**ALLEGHANY**, a river, which, rising in the n. part of Pennsylvania, unites with the Monongahela at Pittsburgh to form the Ohio. Though it flows through a hilly country, yet it is navigable for nearly 200 m. above Pittsburgh, whence by the Ohio and the Mississippi the navigation extends to the gulf of Mexico.

**ALLEGHENY**, a co. in w.s.w. Pennsylvania; 750 sq.m.; pop. '70, 262,204. Near the middle of the co. the A. and Monongahela rivers join and form the Ohio. The surface is greatly diversified, with fine scenery; soil fertile; coal, iron, and limestone are found; cattle, wool, grain, and hay are the staples; manufactures very extensive, especially of iron. Co. seat, Pittsburgh.

**ALLEGHENY**, a c. of Pennsylvania, opposite Pittsburgh, on the n. bank of the Allegheny river, has besides its factories numerous and important public institutions, such as the western penitentiary, a Presbyterian college, a Catholic orphanage, a college for colored persons. Pop. '80, 78,472, of whom about a half are Germans.

**ALLEGHENY CITY** (*ante*), one of the chief manufacturing centers of Pennsylvania, on the w. side of the A. river, opposite to Pittsburgh; pop. '80, 78,472. It is a favorite place of residence for the business men of the neighboring c., and there are some important public buildings. The western penitentiary is a very large structure in the old Norman style, completed in 1827 at a cost of \$183,000. There are usually between 400 and 500 inmates, nearly all of whom are employed in some mechanical labor. The

Western Theological Seminary of the Presbyterian church was established here in 1837. Before the reunion of the "old" and the "new school" branches of the church, it was managed by the "old school." In 1878 the seminary had five professors and 183 students. The theological seminary of the United Presbyterian church, established in 1825, is also here, and at last report had four professors and 46 students. There is also the Allegheny Theological Institute, organized in 1840 by the Reformed Presbyterian church. There are about 50 churches; and among charitable institutions are the home for the friendless, the house of industry, the widows' home, and an orphan asylum. The city park comprises 100 acres, handsomely laid out; and there is a fine monument to the soldiers who fell in the civil war. The chief business of the place is manufacturing, including rolling-mills for iron, cotton-mills, foundries, machine-shops, breweries, a steel factory, a blast furnace, and extensive locomotive works. The two rivers are crossed by twelve bridges, and there is railroad communication in all directions.

**ALLEGIANCE** (Fr. *allégeance*, from Lat. *aligo* or *ad-ligo*, to bind to, or attach). "A." says Blackstone, "is the tie or *ligamen* which binds the subject to the sovereign, in return for that protection which the sovereign affords the subject. A. is the highest legal duty of the subject, and consequently its violation, *Treason* (q.v.), is the highest legal offense. A. is of three kinds: 1. *Natural or implied A.*, which every native or naturalized citizen owes to the community to which he belongs. Independently of any express promise, every man, by availing himself of the benefits which society affords, comes under an implied obligation to defend it, and this equally whether the attack be from without or from within. In time of war, this obligation involves the duty either of bearing arms in defense of the state, or of contributing to the additional taxes and other impositions which the support of a standing army may render necessary. In peaceful times it will be adequately fulfilled by an efficient performance of ordinary citizen duties. 2. *Express A.* is that obligation which arises from an expressed promise, or *oath of A.* The old English oath of A. corresponded in the case of the sovereign, as absolute superior of all the lands in England, to the oath of fealty which, by the feudal law, all vassals were required to take to subject superiors: "As administered for upwards of 600 years, it contained a promise to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honor, and not to know or hear of any ill or damage intended him, without defending him therefrom."—Blackstone, Kerr's edition, vol. i. 238. This oath being thought to favor too much the notion of non-resistance, another form was introduced by the convention parliament. That in use since the passing of the new naturalization act in 1870 (33 Vict. c. 14), is as follows: "I do swear that I will be faithful and bear true A. to her majesty queen Victoria, her heirs and successors, according to law. So help me God." From the reign of queen Elizabeth down to the present time, the oath of A. has been required from all public functionaries, before entering on their offices, and by all professional persons before being permitted to practice. 3. *Local or temporary A.* is that obedience and temporary aid due by an *alien* (q.v.) to the state or community to which he resides. Local differs from the higher kinds of A. in this, that it endures only so long as the alien resides within the queen's dominions, whereas natural A., whether implied or expressed, is perpetual, following not only the individual himself, but his children and grandchildren. By the provisions of the act above referred to, A. may now be renounced, even by natural-born subjects, and this, whether born within the realm or not, by a declaration of alienage (sec. 4), and it is forfeited by the acceptance of the A. of a foreign state (sec. 6). But the A. thus forfeited may be resumed. A natural-born British subject who has become an alien in pursuance of this act, may, on performing the same conditions as are required of an alien applying for a certificate of nationality (see NATURALIZATION), apply to one of her majesty's principal secretaries of state for a certificate of readmission to British nationality (sec. 8). In a colony, the like powers are conferred on the governor.

By the law of England, and agreeably to the spirit of the constitution, a usurper in undisputed possession of the crown, or king *de facto*, is entitled to A., because he then represents, not the sovereign whom he has dispossessed, but the general will in which the ultimate sovereignty of England resides. This doctrine was applied when Edward IV. recovered the crown from the house of Lancaster, and treasons committed against Henry VI. were capitally punished. The sovereign may by proclamation summon his subjects to return and take part in the defense of the kingdom, when menaced or endangered. Of this, an instance occurred in 1807, when all seamen and seafaring men who were natural-born subjects were recalled from foreign service. The option of accepting the foreign A. would now be given them, and the same legal outlet is furnished from the provisions of the otherwise unenforceable foreign enlistment act (q.v.).

**ALLEGIANCE** (*ante*). It is but recently that foreign governments have come to recognize the right of persons to change their allegiance as well as their residence. The United States always held it to be a natural right, and our legislation so recognizes it. The difference was strikingly manifest in the war of 1812, when the prince regent proclaimed that every native-born Briton taken prisoner while fighting for the Americans should be shot for treason, to which president Madison replied that if any naturalized American of the United States should suffer death in such manner he would execute two British prisoners. There were no executions of the sort which England had threatened.

Very recently the question has been discussed as to the right of a government to subject to military service men who were once its citizens but were afterwards citizens of another country; and late decisions tend to show that most governments are abandoning the old claim, "once a citizen always a citizen." For instance, Germans naturalized in the United States on returning to Germany were formerly required to enter the army; but now they plead American citizenship, and with success. Allegiance is often transferred *en masse*, as on the treaty of peace in 1783, when British subjects who should so elect became Americans; also, when Louisiana and Florida were purchased and Texas was annexed; no inquiry was made about allegiance, but the official transfer made the creoles and the Texans as completely citizens owing allegiance as though born under the U. S. flag. The law of congress, July, 1868, very clearly sets forth the extent and obligations of allegiance. The preamble states that the right of expatriation is natural and inherent in all people and indispensable to the enjoyment of rights to life, liberty, and the pursuit of happiness; that, recognizing this right, our government has received emigrants from all nations and given them citizenship and protection; that it is necessary for the maintenance of public peace that the claim of foreign allegiance as to such adopted citizens should be promptly and finally disavowed; and therefore it was enacted that any declaration, opinion, order, or decision of any officer of this government which denies, impairs, restricts, or questions the right of expatriation, is inconsistent with the fundamental principles of the government; that all naturalized citizens of the United States, while in foreign states, are entitled to, and shall receive from this government, the same protection of person and property that is accorded to native-born citizens in like circumstances. This broad declaration of our rights and duties was followed in May, 1870, by the British parliament in an act revising all British laws on alienage, expatriation, and naturalization—the government for the first time recognizing the right of subjects to renounce allegiance to the crown.

**ALLEGORY**, as a figure of rhetoric, signifies properly, the embodiment of a train of thought in a visible form, by means of sensible images, having some resemblance or analogy to the thoughts. A., therefore, is one of the tropes (q. v.), for it involves a transfer of meaning. It differs from metaphor chiefly in extent; metaphor is confined to a single expression, or at most to a sentence. A. is carried through the whole representation. It is not abstract ideas alone that are adapted to allegorical treatment; not only may virtue and vice, for instance, be personified and treated allegorically, but real persons may be represented by allegorical persons.

We find A. in use from the earliest ages. Oriental people are specially fond of it. As examples from antiquity may be cited, the comparison of Israel to a vine in the 80th psalm; the beautiful passage in Plato's *Phaedrus*, where the soul is compared to a charioteer drawn by two horses, one white and one black; the description of fame in the 4th book of the *Æneid*. Bunyan's *Pilgrim's Progress* is perhaps the most fully carried out A. of modern times.—A. is not confined to language, but is carried into painting and sculpture, and also into scenic representation—as in the ballet and pantomime; the consideration of it is, therefore, of importance in the fine arts generally.

**ALLEGORICAL INTERPRETATION** is that kind of interpretation by which the literal significance of a passage is either transcended or set aside, and a more spiritual and profound meaning elicited than is contained in the form or letter. The common idea is that it originated with the Alexandrine school, but this is by no means the case, as we find it employed by the older Hindus. From the scholars of Alexandria, however, it was adopted by the Jews of Palestine, a sect of whom in particular, namely, the Essenes, made abundant use of it. The apostle Paul himself allegorizes, or at least spiritually interprets the history of the free-born Isaac and the slave-born Ishmael (Gal. iv. 24). Allegorical interpretation, however, with reference to the Old Testament, was most extensively employed by Philo Judæus, a philosophical Jew of Alexandria, and a contemporary of Jesus Christ. His writings stimulated the allegorizing tendencies of the Alexandrine school of Christian theologians, the most famous of whom are Clemens Alexandrinus and Origen. The latter went so far as to say that "the scriptures are of little use to those who understand them as they are written." As a specimen of his method of biblical interpretation, we may adduce the following: He maintained that the Mosaic account of the garden of Eden was allegorical; that paradise only symbolized a high primeval spirituality; that the fall consisted in the loss of such through spiritual and not material temptation; and that the expulsion from the garden lay in the soul's being driven out of its region of original purity. The Neo-platonists were at first averse to allegorizing, but gradually acquired a relish for it from the Jews and Christians, and applied it to the ancient myths.

**ALLEGRI, GREGORIO**, 1580-1652: a musical composer, b. in Rome, probably of the Coreggio family. He studied under Nanani, and was a friend of Palestrini. He composed motets and sacred pieces: was appointed to the choir of the Sistine chapel, Rome, by Urban VIII., remaining until his death. He was one of the earliest composers for stringed instruments; but his most celebrated work is the *Miserere*, still annually rendered in the Sistine chapel.

**ALLEGRO**, the fourth of the five principal degrees of movement in music, implying that the piece is to be performed in a quick or lively style. A., like all the other degrees of movement, is often modified by other terms, such as *A. non tanto*, *A.*

*ma non troppo, A. moderato, maestoso, giusto, commodo, vivace, assai, di molto, con brio*, etc. As a substantive, A. is used as the name of a whole piece of music, or a movement of a symphony, sonata, or quartet.

**ALLEMANDE**, the name of a dance invented by the French in the time of Louis XIV., and which again became popular at the Parisian theaters during the reign of the first emperor. It has a slow waltz kind of tempo, and consists of three steps (*pas marchés*) made in a sliding manner, backwards and forwards, but seldom waltzing or turning round. The whole charm of the dance lies in the graceful manner of entwining and detaching the arms in the different steps. Both the dance and the music are said to have originated in Alsace; and thus the introduction of the A. at the court of Versailles was a sort of artistic way of symbolizing the incorporation of the newly acquired German provinces.

**ALLEINE**, or **ALLEIN**, **JOSEPH**, 1633-33; an English non-conformist divine; author of *An Alarm to the Unconverted*. He was educated in Corpus Christi college, and became a tutor there. He was offered a political place, which he declined, but gladly took the office of assistant to George Newton, rector of the church of St. Mary Magdalene, Taunton. About this time he married Theodosia, daughter of Richard Alleine. He was not only constant in religious work, but deeply learned in various sciences, and on intimate terms with the patriarchs of the royal society. When the persecution of non-conformists came, he and his senior pastor were ejected, and A. became an itinerant preacher of the gospel wherever he could find opportunity. For this he was imprisoned, but released in May, 1664; yet in spite of the conventicle act or five-mile act, he pursued his work and was again imprisoned. His later years were full of persecution and suffering. No Puritan non-conformist name is more affectionately cherished than his.

**ALLEINE**, or **ALLEIN**, **RICHARD**, 1611-81; an English writer and theologian, author of *Vindicia Petatis*; educated at Oxford; assistant in the ministry to his father, Richard A., and noted for eloquence. He declared for the Puritans, but continued for 20 years rector of Batcomb in Somerset. On the passage of the act of uniformity he went with the ejected, and, after the five-mile act, preached where he could find occasion. His *Vindication of Piety* was refused license, and Roger Norton, the king's printer, caused a large part of the first edition to be seized and sent to the royal kitchen for kindling; but, on reading it, he brought back the sheets and sold the work from his own shop, for which he had to beg pardon on his knees at the council table.

**ALLEMAN'NI**. See **ALEMANNI**, *ante*.

**ALLEN**, **Bog** of, a general name applied to a congeries of morasses e. of the Shannon, in King's co. and Kildare, Ireland, comprising in all about 238,500 Eng. acres. The strips of arable land which intersect this bog are occasionally watered by rivers which have their sources in the contiguous fens, such as the Barrow, Boyne, and Brosna; the Grand canal also passes through it. The average elevation of the morasses is 350 ft. above the sea-level. They approach to within 17 m. of Dublin on the e., and almost to the Shannon on the w. The depth of the peat found in them is about 25 ft.

**ALLEN**, a co. in Indiana, on the Maumee river, and intersected by four railroads; 698 sq.m.; pop. '80, 54,555. It is level and fertile; agricultural products are the staples; machinery, flour, metal ware, and carriages are made. Co. seat, Fort Wayne.

**ALLEN**, a co. in s.e. Kansas; intersected by the Neosho river, and the Galveston and Leavenworth railroad; 432 sq.m.; pop. '80, 11,252. It has good timber, the soil is good for stock raising and general agriculture. Coal is found. Co. seat, Iola.

**ALLEN**, a co. in Kentucky, on the Tennessee river; 300 sq.m.; pop. '80, 12,330—1104 colored. The surface is level; soil moderately fertile. Limestone caverns abound. Cattle, grain, tobacco, and wool are produced. Co. seat, Scottsville.

**ALLEN**, a co. in w.n.w. Ohio; intersected by the Auglaize and Ottawa rivers, and the Wabash and Erie canal; 405 sq.m.; pop. '70, 23,623. It is level, well timbered, and fertile; cattle, hay, wool, lumber, and grain are produced, and wheeled vehicles are made; two railroads intersect it. Co. seat, Lima.

**ALLEN**, **ELIZABETH AKERS**, an American poet, known by her *nom de plume* of "Florence Percy;" b. Me., Oct. 9, 1832. She married Paul (Benjamin) Akers, an American sculptor, and afterwards married E. M. Allen, of New York. She published a volume of poems in 1867, and has contributed largely to magazines.

**ALLEN**, **ETHAN**, 1739-89, b. Conn. He early settled in Vermont with four brothers, and became conspicuous in the contest in which both New Hampshire and New York claimed territorial jurisdiction. He was the agent of the settlers in a suit at Albany; the suit went against them and they resolved upon resistance, making A. colonel of a force which drove out the New York settlers; whereupon gov. Tryon offered £150 reward for his arrest. In this condition they were when the war of the revolution began, and one of the first points decided upon was the occupation of Ticonderoga. Allen starting at once with his Green Mountain boys, was soon joined by others, including Arnold; and on the morning of May 10, 1775, he surprised the English captain, Delaplace, in his bed, demanding surrender "in the name of the great Jehovah and the Con-

tinental congress." This stroke wrested all the northern region from the English. The Americans also took Skenesborough and Crown Point. A dispute between A. and Arnold about the command was ended by the arrival of a Connecticut regiment, with col. Hinman, who ranked both; and then A. proposed an invasion of Canada, but was not heeded. He went to Philadelphia, where congress acknowledged his services. Then he joined gen. Schuyler's army, and was employed in secret missions to Canada, rendering valuable aid in Montgomery's expedition. He was taken prisoner, Sept. 25, 1775, in an unfortunate demonstration by major Brown upon Montreal, and was sent to England. Some months later he was returned to this country and kept in the prison ships and jails in Halifax and New York until May 8, 1778, when he was exchanged. While a prisoner he was for the most part barbarously treated and kept heavily ironed. He was warmly received by Washington, and was going into the army again when he was diverted towards the old boundary troubles between New York and New Hampshire. While thus engaged an effort was made by the English through a conspicuous tory, Beverly Robinson, to seduce A. from his American loyalty, but of course without success, though he made the affair serve to preserve the neutrality of the English towards his mountaineers. A. was twice married and left a widow and seven children. He was noted as a free-thinker, or deist, and wrote *Reason the only Oracle of Man*, in which the Bible and religion are assailed with considerable vehemence.

ALLEN, IRA, 1752-1814; brother of Ethan. He served in the revolutionary army; was a member of the Vermont constitutional convention; was secretary of state; then treasurer, surveyor general, and held other offices. While in France in 1795 he bought 20,000 muskets and 24 cannon, intending to sell them to Vermont; but he was captured at sea and taken to England on charge of furnishing arms to Irish rebels. He was acquitted after a lawsuit that lasted eight years. He published *The Natural and Political History of Vermont*.

ALLEN, JOHN, M.D., a *littérateur* of considerable talent, was born at Redford, in the parish of Colinton, near Edinburgh, in 1770. He was educated at the university of Edinburgh, where he took his degree at the age of 21. Four years later, he entered the lists against Dr. Gregory in defense of Hume's speculations on liberty and necessity. In 1801, he published *An Introduction to the Study of the Animal Economy*, translated from Cuvier. About a year after, along with his friends, lord and lady Holland, he set out on a tour through France and Spain, where he resided till 1805. On his return, he devoted himself to the discussion of political questions in the pages of the *Edinburgh Review*. He was a keen reformer, and brought to bear upon constitutional questions a wealth of research, a closeness of reasoning, and a vigor of understanding that rendered him a formidable adversary. He is said to have contributed upwards of 40 articles to the *Edinburgh Review*, chiefly on British, French, Spanish, and South American politics. His most valuable work is considered to be his *Inquiry into the Rise and Growth of the Royal Prerogative in England* (1830). On one or two occasions, he held temporary political offices, and was, in addition, for some time master of Dulwich college. He died in 1843.

ALLEN, SAMUEL, 1635-1705; a London merchant, who bought a large tract in New Hampshire, including Portsmouth, and extending 60 m. inland, which purchase caused a lawsuit with the actual settlers that lasted until A.'s family became extinct. He acted as governor of New Hampshire until the arrival of the earl of Bellamont in 1699.

ALLEN, SOLOMON, 1751-1821; a revolutionary soldier who rose to the rank of major. He was one of the guards of Andre after his capture, and he assisted in putting down Shay's rebellion. At the age of 50 he became a clergyman.

ALLEN, STEPHEN, b. 1767; d. in the burning of the *Henry Clay* steam-boat on the Hudson river, July, 1852; a sail-maker and eminent merchant; mayor of New York in 1831. He was a strong advocate of local improvements, especially the introduction of Croton water.

ALLEN, STEPHEN, D.D., b. Me., 1810; a minister and teacher in the M. E. church; graduate of Bowdoin, 1835. He entered the ministry in 1839; and for a long period was principal of the Maine Wesleyan seminary.

ALLEN, THOMAS, 1742-1810; b. Mass., graduate of Harvard, 1762; ordained the first Congregational minister of Pittsfield, Mass., in 1764. He was twice chaplain in the revolutionary army, and was active in the battle of Bennington. He was minister of the church in Pittsfield until his death, after 46 years of service.

ALLEN, WILLIAM, 1770-1848; an English chemist, lecturer in Guy's hospital, fellow of the royal society, and one of the founders of the pharmaceutical society. With Mr. Pepys he established the proportion of carbon in carbonic acid, and showed that the diamond was pure carbon. In later life he was devoted to improving the condition of the poor by founding schools, building improved houses, and kindred labors.

ALLEN, WILLIAM, 1806-79; b. N. C. He studied law, and became partner of col. King, son of Rufus King, of New York. He settled at Chillicothe, O., and was twice elected to congress by the democrats, but was beaten in the third trial. He was elected senator from Ohio and took his seat March 4, 1837, and was re-elected six

years later. In 1848, he was offered the nomination for president, but declined it on the ground that he was pledged to gen. Cass. In 1873, he was elected governor of Ohio. In the last year or two of his life he became prominent as an advocate of "soft money" or greenbacks, and was credited with originating what was inaptly styled "the Ohio idea" in national finance.

ALLEN, WILLIAM, D.D., 1794-1869; b. Mass.; a graduate of Harvard in 1802; licensed to preach in 1804. He preached in western New York, became regent and assistant librarian in Harvard college, at which time he prepared his *American Biographical and Historical Dictionary*, the first work of general biography published in the United States. The third edition has notices of nearly 7000 Americans, while the first edition has only 700. In 1810, he became his father's successor in the pulpit in Pittsfield. He was president of Dartmouth college in 1817; from 1820 to 1829, president of Bowdoin college. He spent his later life in literary work, publishing *Junius Unmasked*, *Accounts of Shipwrecks*, *Psalms and Hymns*, *Christian Sonnets*, *Poems of Nazareth and the Cross*, *Winnison, or the Fate of the Hoosatunnuk*, etc. He was a philologist, and contributed many thousands of words to Webster's and Worcester's dictionaries.

ALLEN, WILLIAM HENRY, 1784-1813; b. R. I. He was in the American navy as a lieutenant on the frigate *United States* in the action with the *Macedonian*, Oct. 25, 1812, in which the latter was captured. Afterwards he commanded the brig *Argus*, cruising off England in 1813, and capturing \$2,000,000 worth of property, until, Aug. 14, he encountered the British brig *Pelican*, and lost his own vessel, and died the next day of wounds received in the fight.

ALLEN, WILLIAM HENRY, LL.D., b. Me., 1808; a graduate of Bowdoin college in 1833; Latin teacher in Cazenovia, N. Y., seminary, 1833-35; professor of natural philosophy and chemistry in Dickinson college, Carlisle, Pa., 1836-46; professor of philosophy and English literature in the same, 1846-49; and acting president, 1847-48; president of Girard college, Philadelphia, 1849-62; and for one year president of Pennsylvania agricultural college. In 1867, he returned to Girard college as president. In 1872, he was chosen president of the American Bible society.

ALLENTOWN, a thriving borough of Pennsylvania, U. S., 85 m. to the e. of Harrisburg, and 50 to the n. of Philadelphia. It is situated on an affluent of the Lehigh, with canal and railway communication. It is within easy reach of slate, limestone, coal, and iron. Pop. in '80, 18,162.

ALLEYN, EDWARD, a distinguished actor, the contemporary and friend of Shakespeare, was born in 1566, and died in 1626. His connection with the English stage during the period of its highest prosperity, invests his life with interest to the student of literary history; but it is as the munificent and pious founder of Dulwich college, (q.v.) that he principally claims the remembrance of posterity. The building of the college was begun in 1613, and in 1619 the institution obtained the royal charter, after some obstruction on the part of lord Bacon, who wished the king to apply part of the grant to the foundation of two lectureships at Oxford and Cambridge. A. himself took up his quarters in the college as master, living, with his wife as a pensioner, on equal terms with the sharers of his bounty. He also founded numerous almshouses in London.

ALLERTON, ISAAC, d. 1659; one of the Plymouth pilgrims in the *Mayflower*; at first he had much influence, but he became unpopular and removed to New York, where he was for some time a merchant of note. He was married three times, once to a daughter of William Brewster.

ALLES'TREE or ALLEST'RY, RICHARD, D.D., 1619-81; an English divine; moderator in philosophy; canon of Christ's church, Oxford; doctor of divinity; chaplain in ordinary to the king, and regius professor of divinity. He served with distinction in the royalist army, undergoing much suffering and imprisonment for his devotion to the royal cause. He built a portion of Eton college and the grammar school of Christ church college. His library he bequeathed to the university.

ALL'GAIER, JOHANN, d. Prague, 1826; a German chess player and writer. He was captain in the Austrian service, and lived chiefly in Vienna. His name is preserved in the "Allgaier gambit," a chess opening which he devised.

ALL-HALLOW. See ALL SAINTS, *ante*.

ALL'IA, a small stream which fell into the Tiber, 11 m. n. of Rome. It is celebrated as the scene of the defeat of the Roman army by the Gauls under Brennus in 387, or, according to others, 390 B.C. Immediately afterwards, Rome was taken, plundered, and burnt. It is difficult to identify the A. with any of the modern streams; but the evidence seems in favor of the *Secolo del Casale*.

ALLIA'CEOUS PLANTS are those of the genus *allium* (q.v.), or others nearly allied to it. The term is generally employed to denote not only the possession of certain botanical characters, but also of a certain smell and taste, well known by the term *alliaceous*, and of which examples are readily found in the onion, leek, garlic, and other familiar species of *allium*, much employed for culinary purposes. These plants contain free phosphoric acid, and a sulphureted oil, which is partly dissipated in boiling or roasting. The A. flavor is, however, found also, although in comparatively rare instances,

in plants of entirely different botanical affinities—for example, in *alliaria officinalis*, of the natural order *cruciferae* (see ALLIARIA), in the young shoots of *cedrela angustifolia*, a tropical American tree of the natural order *cedrelaceae*, allied to mahogany; and in certain species of *diospyron* and *hartighsea*, of the kindred order *melicaceae*, the fruit of which is used instead of garlic by the mountaineers of Java.

**ALLIANCE**, a compact between independent families or nations. See TREATY, HOLY ALLIANCE, TRIPLE ALLIANCE.

**ALLIANCE**, a t. in Stark co., Ohio, where the Fort Wayne and Chicago and Cleveland and Pittsburgh railroads cross; pop. '80, 4633. It has many factories of horse-rakes, reapers, pumps, etc.; also rolling-mills, lead works, newspapers, a college, and libraries.

**ALLIARIA**, a genus of plants of the natural order *cruciferae* (q.v.), closely allied to *sisymbrium* and *erysimum*, but differing from both in having the stalks of the seeds flat and winged. The best known species is *A. officinalis* (*erysimum* A. of Linnaeus, and ranked by some botanists in the genus *sisymbrium*), known by the popular names of sauce-alone and jack-by-the-hedge. It is a native of Britain, not unfrequently found on hedge-banks and in waste places in dry rich soils, and is common in most parts of Europe. It is a biennial, with a stem 2 to 3 feet high; large, stalked, heart-shaped leaves; white flowers, and pods much longer than their stalks, which are somewhat spreading. It is remarkable for its strong alliaceous odor, is occasionally used as a pot-herb in Britain, and very generally, at least by the poorer classes, in some continental countries. It seems more deserving of cultivation than many other plants which have long received the constant care of the gardener, being wholesome, nutritious, and, to most persons, pleasant. The powdered seeds were formerly employed as a sternutatory.

**ALLIBONE, SAMUEL AUSTIN**, LL.D., b. 1816; an American bibliographer, compiler of *A Critical Dictionary of English Literature, and British and American Authors, Living and Deceased, from the earliest accounts to the latter half of the Nineteenth Century*, with notices of 46,499 writers. He has written controversial essays and articles for various periodicals, including *The North American Review* and *Evangelical Quarterly Review*. In 1876, he published two volumes of English quotations, one of prose and one of verse.

**ALLICE**, or ALLIS. See SHAD.

**ALLIER**, a river in France, a tributary of the Loire, has its source in the water-shed of the e. of the department of Lozère; flows with a northerly course through Haute-Loire, Puy-de-Dôme, and Allier; and after a course of more than 200 m., falls into the Loire below the t. of Nevers. It is navigable for a considerable portion of its length.

**ALLIER**, a department in the center of France, has an area of 2810 sq. m., and a pop. of (76) 405,783. It is a hilly district, especially in the s., sloping down towards the river Loire in the n., and is partly woody, but generally well cultivated, producing the usual kinds of grain with wine and oil. It is also rich in minerals, especially iron, coal, antimony, manganese, and marble. There is some manufacturing industry in cotton, wool, linen, carpets, pottery, and glass; but the majority of the population is engaged in agriculture. Mineral springs are found at Vichy, Neris, and Bourbon-l'Archambault. The chief t. is Moulins. Other important places are Montluçon, La Palisse, Gannat. At Chantelle-le-Chateau are the extensive ruins of king Pepin's castle.

**ALLIGATION**, from a Latin word signifying "to bind together," is a rule in arithmetic which teaches to solve such questions as the following: 3 lbs. of sugar at 6*d.* are mixed with 5 lbs. at 10*d.*; what is the price of a pound of the mixture? or: In what proportion must sugar at 6*d.* be mixed with sugar at 10*d.*, to produce a mixture at 8½*d.*?

The solution of the first is  $\frac{3 \times 6 + 5 \times 10}{3 + 5} = 8\frac{1}{2}d.$

In the second, the proportional number for one ingredient is the difference between the price of the other and that of the mixture; the number for the cheap sugar is therefore 1½, and for the dear, 2½, which are as 3:5, so that there must be 3 lbs. at 6*d.* for every 5 lbs. at 10*d.* If there are more than two ingredients, the problem becomes indeterminate; that is, it admits of a variety of answers. Thus: Of three metals, whose specific gravities are 10, 15, and 16, it is required to compose an alloy, whose specific gravity shall be 14. The conditions will be answered by mixing them in any of the following proportions: 1, 2, 1; 2, 2, 3; 6, 2, 11, etc.

**ALLIGATOR**, a genus of saurian reptiles, of the family of the *crocodilidae*, and still regarded by some naturalists as a mere sub-genus of *crocodilus*; although it has recently been proposed to constitute a family or sub-family of *alligatoridae*, and to divide it into the genera *jacare*, *alligator*, and *caiman*. The alligators differ from the true crocodiles in the shorter and flatter head, the existence of cavities or pits in the upper jaw, into which (and not into mere notches between the teeth, as in the crocodiles) the long fourth teeth of the under jaw are received, and the much less webbed feet. In consequence of the different manner in which provision is made in the upper jaw for the reception of the longest teeth of the lower, the head of the alligators is broader and the snout more obtuse than in the crocodiles. Their habits are less perfectly aquatic; they frequent swamps and marshes, and may be seen basking on the dry ground during the day, in the heat of

the sun. They are most active during the night, and then make a loud bellowing. They have great strength in their tails, with which the larger ones can easily upset a light canoe. They feed chiefly on fish, but do not object to other animal food. The females lay their eggs, 20 to 60 in number, in the mud, and leave them to be hatched by the heat of the sun, but keep watch over the spot, and show much affection for their young ones, many of which, however, fall a prey to the old males, and to vultures and fishes. There are several species, varying from 2 to 20 ft. and upwards in length. Perhaps the most fierce and dangerous is that found in the southern parts of the United States, as far up the Mississippi as the Red river, *A. lucius*. The snout is a little turned up; and its resemblance to that of a pike has led to the specific name *lucius*. In cold weather, these animals bury themselves in the mud, and become so torpid, that they may be cut to pieces without showing signs of sensibility; but a few hours of bright sunshine are enough to revive them. Like the other species, they are so protected by their mailed plates, that they are not easily killed, except by a shot or blow over the eyes. A very strong kind of leather is prepared from the skin, which is used for making saddles. It is said that a considerable quantity of oil can be extracted from an *A.*, which is transparent and burns well. The alligators of South America are there very often called *caymans*, probably an Indian name, and some of them bear the name of *yacaré*, particularly *A. sclerops*, also distinguished as the spectacled cayman, on account of a prominent bony rim surrounding the orbit of each eye. This species appears to be widely distributed over tropical America, and attains a great size. Alligators are not known to exist in any quarter of the world except America, in which, however, true crocodiles are also found. But among the fossils of the s. of England are remains of a true *A.* (*A. hantonensis*) in the Hordle beds. The flesh of alligators is eaten by Indians and negroes. It has a musky flavor.—The origin of the name is uncertain, but it is supposed to be a corruption of the Portuguese *lagarto*, a lizard. Cuvier adopted it as a scientific name.

**ALLIGATOR APPLE.** See CUSTARD APPLE.

**ALLIGATOR PEAR.** See AVOCADO PEAR.

**ALLINGHAM, WILLIAM**, an English poet, b. about 1828, in Ireland; author of *Day and Night Songs*, *Laurence Bloomfield*, and many excellent short poems. He has been employed in the custom service, and since 1864 has enjoyed a literary pension.

**ALLITERATION** is the frequent occurrence in a composition of words beginning with the same letter. In old German, Anglo-Saxon, and Scandinavian poetry, *A.* took the place of rhyme. This kind of verse, in its strict form, required that in the two short lines forming a couplet, three words should begin with the same letter, two in the first line or hemistich, and one in the second; as in the following couplet of Anglo-Saxon poetry:

*Firum foldan  
Frea almihtig.—Cædmon.*

*A.* has not quite disappeared from Icelandic poetry to this day. Alliterative poems continued to be written in English after it had assumed its modern form; the most remarkable is *Pierre Plowman*, a poem of the 14th c., of which the following is a specimen, the two hemistichs being written in one line:

*Mercy hight that maid, | a meek thing withal,  
A full benign burd, | and buxom of speech.*

Even after the introduction of rhyme, *A.* continued to be largely used as an embellishment of poetry, and is so, though to a less extent, to this day:

*The fair breeze blew, the white foam flew,  
The furrow followed free.—Coleridge.*

Besides the Gothic, there are other nations widely separated from each other, among whom the essential distinction of verse is *A.*; the Finns, for instance, and the Tamuls in the s. of India.

But *A.* is not confined to verse; the charm that lies in it exercises great influence on human speech generally, as may be seen in many current phrases and proverbs in all languages: Ex., "life and limb," "house and home," "wide wears, tight tears," etc. It often constitutes part of the point and piquancy of witty writing. Among modern writers this application of *A.* is perhaps most felicitously exemplified by Sidney Smith, as, when in contrasting the conditions of a dignitary of the English church and of a poor curate, he speaks of them as "the right reverend Dives in the palace, and Lazarus-in-orders at the gate, doctored by dogs and comforted with crumbs."

In the early part of the 17th c., the fashion of hunting after alliterations was carried to an absurd excess; even from the pulpit, the chosen people of God were addressed as "the chickens of the church, the sparrows of the spirit, and the sweet swallows of salvation." *One New-Year Gift*, or address, presented to Mary queen of Scots by the poet, Alexander Scott, concludes with a stanza running thus:

*Fresh, fulgent, flourist, fragrant flower formose,  
Lantern to love, of ladies lamp and lot,  
Cherry naist chaste, chief carbuncle and chose, etc.*

In the following piece of elaborate trifling, given (but without naming the author) in H. Southgate's *Many Thoughts on Many Things*, alliteration is combined with acrosticism:

A n Austrian army, awfully arrayed,  
B oldly by battery besieged Belgrade;  
C ossack commanders cannonading come,  
D ealing destruction's devastating doom;  
E very endeavor engineers essay  
F or fame, for fortune, forming furious fray.  
G unt gunners grapple, giving gashes good;  
H eaves high his head heroic hardihood;  
I braham, Islam, Ismael, imps in ill,  
J ostle John Jarovitz, Jem, Joe, Jack, Jill;  
K ick kindling Kutusoff, kings' kinsmen kill  
L abor low levels loftiest, longest lines;  
M en march 'mid moles, 'mid mounds, 'mid murch'rous mines.  
N ow nightfall's near, now needful nature nods,  
O pposed, opposing, overcoming odds.  
P oor peasants, partly purchased, partly pressed,  
Q uite quaking, "Quarter! quarter!" quickly quest.  
R eason returns, recalls redundant rage,  
S avessinking soldiers, softens signiors sage.  
T ruce, Turkey, truce! truce, treach'rous Tartar train!  
U nwise, unjust, unmerciful Ukraine,  
V anish, vile vengeance! vanish, victory vain!  
W isdom wails war—wails warring words. What were  
X erxes, Xantippe, Ximenes, Xavier?  
Y et Yassy's youth, ye yield your youthful yest.  
Z ealously, zanies, zealously, zeal's zest.

**ALLIUM**, a genus of plants of the natural order *Liliacea* (q.v.) containing a large number of species, perennial—more rarely biennial—herbaceous plants, more or less decidedly bulbous-rooted, natives chiefly of the temperate and colder regions of the northern hemisphere. The flowers are umbellate, inclosed in a spathe, and the umbel often bears also small bulbs along with its flowers. The perianth is of six-spreading pieces, resembling petals, having the stamens inserted in their base. The fruit is a triangular capsule, and the seeds are angular. The leaves are generally narrow, although in some species, as *A. ursinum*, they are rather broad, and in a considerable number they are rounded and fistulose. **GARLIC** (q.v.), **ONION** (q.v.), **LEEK** (q.v.), **SHALLOT** (q.v.), **CHIVE** (q.v.), and **ROCAMBOLE** (q.v.) are species of this genus in common cultivation. The first four are cultivated in the gardens of India as well as of Europe, along with *A. tuberosum*; and the hill-people of India eat the bulbs of *A. leptophyllum*, and dry the leaves, and preserve them as a condiment. A number of other species are occasionally used in different countries.—Eight or nine species are natives of Britain, of which the most common is **RAMSONS** (*A. ursinum*), a species with much broader leaves than most of its congeners. It is most frequently found in moist woods and hedge-banks; but occasionally in pastures, in which it proves a troublesome weed, communicating its powerful odor of garlic to the whole dairy produce. **Crow garlic** (*A. vineale*), another British species, is sometimes very troublesome in the same way, in drier pastures. Both are perennial, and to get rid of them their bulbs must be perseveringly rooted out, when the leaves begin to appear in spring.

**ALLIX, PIERRE**, 1641-1717; a divine of the French reformed church, pastor at Charenton, near Paris. After the revocation of the edict of Nantes he went to London, where he opened a church for French exiles, in which the service was in that language but according to the English ritual. He wrote much, chiefly controversial works. His learning was great.

**ALLOA**, a seaport t. in Clackmannanshire, Scotland, is situated on the left bank of the Forth, where the river widens into its estuary, 7 m. (by road) below Stirling. Pop. in '71, 9362. It is a t. of considerable antiquity, and is an active center of trade and manufactures. The principal articles manufactured are whisky and oil, the latter of which is highly esteemed. There are extensive glass, iron, and brick works, and ship-building yards. Copper utensils, shawls and blankets, leather, tobacco, and snuff are manufactured to a considerable extent; and a large quantity of coal is regularly exported from the pits in the immediate neighborhood of the t. The latter forms one of the chief items in the coasting trade, besides which there is a considerable foreign trade, chiefly outwards. The 537 vessels that entered the port in 1876 had a tonnage of 72,443 tons. The harbor is good, with 16 ft. of water at neap and 22 at spring tides; it is furnished with a dry-dock. There is a steam-boat ferry across the Forth, connecting the t. by a short junction line with the Scottish Central railway. It is also connected with that line, and with the Edinburgh and Northern railway, by the Stirling and Dunfermline branch. There is regular steam-communication by the river with Edinburgh and Stirling. In the neighborhood is Alloa tower, 89 ft. high, supposed to have been built in the 13th c., once the residence of the Erskines, and at different times of Scottish princes.

**ALLOBROGES**, a people of Gaul whose territory is now Savoy and Dauphin. Vienna (the modern Vienne) was their chief town. They were subjected to Rome, 121 B.C., by Fabius Maximus, and remained loyal.

**ALLOCU'TION**, which simply means an "address," is applied, in the language of the vatican, to denote specially the address delivered by the pope at the college of cardinals on any ecclesiastical or political circumstance. It may be considered as corresponding in some measure to the official explanations which constitutional ministers give when questions are asked in parliament, or to the political messages of the French emperor. The court of Rome makes abundant use of this method of address, when it desires to guard a principle which it is compelled to give up in a particular case, or to reserve a claim for the future which has no chance of recognition in the present.

**ALLO'DIUM**, or **ALLODIAL TENURE** (in law), is the free and absolute right of property in land, independent of any burden of homage or fidelity to a superior. When the principal land-holders of England submitted to the yoke of military tenure, and surrendered their lands into the hands of the conqueror at the council of Sarum, feudality, the previous existence or non-existence of which has been a subject of much discussion, was formally recognized, and it henceforth became a fundamental maxim in the law of real property, that "the king is the universal lord and original proprietor of all the lands in his kingdom, and that no man doth or can possess any part of it, but what has mediately or immediately been derived as a gift from him, to be held upon feudal services" (Blackstone, vol. ii. p. 51, Kerr's edition). This maxim, though, as Blackstone remarks, it was even at first little more than a fiction, was not peculiar to England, but prevailed wherever the feudal system obtained, and still forms what may be called the starting-point in all feudal tenures of land. Even where subinfeudations have prevailed to the greatest extent, every title is traceable, in the last instance, to the paramount and universal superiority of the crown. See **FEDERAL SYSTEM**. The surrender of lands in England being the result of political measures, was one universal national act, and, consequently, allodial tenures at once ceased to exist; but in many other countries it was accomplished by private arrangements between the allodial proprietors and the prince, the former being anxious to exchange their normal independence for the greater security enjoyed by the vassals of the sovereign, the latter being willing to receive them as dependents, for the sake either of their personal services in war, or latterly, for the equivalents of these services in money or the produce of the lands. In such countries, feudality, though general, was not universal; and allodial tenures consequently continued to subsist alongside of those originating with the crown. In this position was Denmark, and it is curious that the only examples of allodial tenures to be met with in Great Britain are the Udal rights in the islands of Orkney and Shetland, which formerly belonged to that country. "When these islands," says Mr. Erskine, "were first transferred from the crown of Denmark to that of Scotland, the right of their lands was held by natural possession, and might be proved by witnesses, without any title in writing, which had probably been their law formerly while they were subject to Denmark; and to this day, the lands, the proprietors of which have never applied to the sovereign, or those deriving right from him, for charters, are enjoyed in this manner." By the law of Scotland, all property and superiorities belonging to the crown itself, and all churches, churchyards, mansees, and glebes, the right to which does not flow from the crown, are regarded as allodial; and the term in a wider sense, as opposed to *feudal* generally, is sometimes used with reference to movable property.

The etymology of the word *A.* has been much discussed, and both Celtic and Teutonic origins have been assigned to it. The latter seem the more probable conjectures, as the word, in senses closely resembling that which we attach to it, is to be found in all Scandinavian and Germanic languages. On this supposition, its derivation from *all* (all, or wholly) and *od* (property), seems probable. Another conjecture assigns it to *all* and *oede* (waste). That adopted by Mr. Erskine, of its having been composed of *a* privative, and *leude* or *teute*, people (taken from the people), seems wholly inadmissible, as being inconsistent with the forms of Teutonic speech.

**ALLOP'ATHY.** See **HOMOEOPATHY**.

**ALLO RI, ALESSANDRO**, 1535-1607; a Florentine painter; trained in art by his uncle, Angelo Bronzino, whose name he sometimes assumed. A. was successful in various departments, but especially in portraits.

**ALLO RI, CRISTOFANO**, 1577-1621: a Florentine painter, son of Alessandro. He studied with Pagani, and became one of the foremost of the Florentine school. His pictures are distinguished by their close adherence to nature, and for delicacy and technical perfection of execution. His finest work is "Judith and Holofernes" in the Pitti palace, the model for "Judith" having been the beautiful Mazzafira, the artist's mistress.

**ALLOTMENT OF LAND**, although not a technical, is a well-understood expression in the law of England; and under the general inclosure act (41 Geo. III., c. 109), is used to denote the kind of conveyance or distribution directed to be made to the person or persons who at the time of the division and inclosure shall have the actual possession of the lands, tenements, or hereditaments, in lieu of, or in right of which the allotment is made, but without prejudice to any question of title. By the ancient statute of Merton (20 Henry III., c. 4), the lord of the manor, or any other owner of a common, may inclose so much of the waste as he pleases for tillage or wood-ground, provided sufficient is left for other parties entitled to the use of the same. This right to inclose common fields

and waste lands has in modern times been very generally extended throughout England by means of local acts of parliament, a number of the regulations of which have been consolidated by the act above referred to, by section 7 of which commissioners are appointed to make the allotment.

Generally speaking, this term, as a legal word, may be considered as signifying the grant or allowance of a portion of land too inconsiderable to be made the subject of a formal conveyance; and in this sense it has been used to denote the system or species of agricultural holding which prevailed to some extent in England towards the close of the last century, but which was not in common use throughout the country till 1830, when the agricultural laborers in many counties—owing to the use of threshing-machines and other improvements, which they dreaded would lower their wages—rose in insurrection against their employers. To meet this danger, the A. system was resorted to, and different societies were established for its promotion; and by the comparative contentment and comfort it produced, it may be considered to have been successful in its object. It has been stated to have diminished crime among the peasantry, and generally to have improved and elevated their character. By the form of agreement usually signed by A. tenants, the use of the spade in the cultivation of land is insisted upon, and the plough prohibited, and there are other conditions of the occupancy more or less capricious. The A. may be forfeited for non-payment of the rent, the tenant's misconduct or crime, or willful neglect of his land; but it has been thought unadvisable to exclude any one from enjoying an A. on account of his previous bad character, as, from the nature of the industrious occupation which the A. necessitates, there is the chance of his reclaiming his character. See SPADE HUSBANDRY.

**ALLOTROPY** is the term applied in chemistry to the existence of the same element in various forms, each of which, though containing no extraneous substance, possesses different properties from the others. The various conditions in which a single element can be obtained are known as its allotropic modifications, and though as yet only a few elementary substances have been observed to exhibit such modifications, yet it is generally believed that every element is capable of existing in several allotropic forms. Phosphorus affords an excellent illustration of this doctrine. In ordinary circumstances, and when freshly prepared, phosphorus is a pale, yellow solid, of the consistence and aspect of wax, and to some extent flexible and translucent. It requires to be placed in a vessel with water to keep it from taking fire spontaneously. At any ordinary natural temperature it appears luminous, and evolves an alliaceous odor when exposed to air, owing to a slow process of combustion taking place; and when warmed to  $140^{\circ}$  F., it bursts into flame, and burns vividly. Common phosphorus is soluble in alcohol, ether, the fixed and volatile oils, and especially in bisulphuret of carbon, 100 parts of which, when warm, dissolve 20 parts of phosphorus. But the same element, when dried and kept for some days, with little or no access of air, at a temperature ranging from  $446^{\circ}$  to  $482^{\circ}$  F., passes, weight for weight—without addition or subtraction of matter—into a reddish substance, which is known to chemists as *amorphous* phosphorus. The color of this new variety is scarlet, brownish red, or even blackish red; and it exists as a powder or cake, which does not evolve any odor, or readily take fire, and therefore needs not to be preserved under water. When heated to  $140^{\circ}$ , and even to a temperature a little short of  $482^{\circ}$ , it refuses to burn; and, in fact, it is questionable if phosphorus in this condition will take fire at all; though at  $482^{\circ}$ , and above, the red variety passes back again to the ordinary or yellow phosphorus, and then bursts into flame. Moreover, amorphous phosphorus is insoluble in alcohol, ether, the fixed and volatile oils, and even in bisulphuret of carbon. Probably the most striking difference between these two forms of the same substance is, that ordinary phosphorus is a deadly poison, as is too often evidenced in the death of children from sucking the ends of lucifer-matches; whilst the red or amorphous phosphorus is not known to be poisonous at all.—Besides the two varieties already mentioned, and which are best known, there are *black phosphorus*, *white phosphorus*, and *scaly phosphorus*. The only manner of accounting for the difference of properties evinced by ordinary and red phosphorus, is to refer the change to an absorption of heat during the passage of the ordinary into the red variety. It is an observed fact that such absorption or disappearance of heat does then take place; whilst, when the red phosphorus is heated till it passes back to the ordinary kind, a very rapid disengagement of heat occurs.

Sulphur furnishes another example of A. In the ordinary condition of roll-sulphur, it is a pale, yellow, brittle, crystalline solid; insipid to taste, odorless when cold, and evolving a peculiar odor when heated or rubbed. It dissolves in small quantity in turpentine and the fixed oils, and to the extent of 35 per cent in bisulphuret of carbon. When common sulphur is heated to  $232^{\circ}$ , it fuses, and forms a thin, yellow, limpid liquid like olive-oil; at  $480^{\circ}$  it passes into a thick, dark-brown, viscid liquid, resembling in consistence ordinary treacle; and if, at this stage, it be poured into water, the sulphur forms itself into a thread-like mass or net-work, possessing great elasticity, like india-rubber, not at all brittle, and so soft that it can be molded by the fingers into casts and seals. Again, this elastic form of sulphur is not soluble in turpentine and the fixed oils, or even in bisulphuret of carbon. There are also other allotropic forms of sulphur.

Oxygen may be taken as a third illustration of the same doctrine. In the ordinary form in which oxygen exists in the atmosphere and elsewhere, it is a gas with no odor,

no bleaching properties, and no disinfectant powers. To a certain extent it oxidizes metals, etc.; but comparatively, it may be regarded as a feeble oxidizing agent. By several processes—viz., the introduction of a heated glass rod into a jar containing ordinary air and a little ether; or the presence of clean-scraped sticks of phosphorus in a glass vessel with a confined portion of air; or the passage of electric discharges through or round a glass tube or bottle with air—the oxygen of the atmospheric air is transformed into an allotropic form called *ozone*. In the latter condition, oxygen possesses a very strong and peculiar odor, long known as the electrical odor; has great bleaching powers, and is regarded as the agent in the air which bleaches clothes on the household bleaching-green; and possesses such powerful disinfecting properties, that tainted meat introduced into ozonized air has the disagreeable odor destroyed, and smells fresh when taken out. Ozone is doubtless the great natural agent which removes many deleterious gases and vapors, and destroys infectious matter floating in or diffused through the air. See OZONE.

ALLOUEZ, CLAUDE JEAN, 1620-90; one of the early Jesuits who visited the American lakes; trained in work in the Algonquin missions on the St. Lawrence. He founded the mission of the Holy Ghost on lake Superior in 1635, explored Green Bay, and established missions among the Illinois Indians, settling at Kaskaskia and continuing the mission begun by Marquette; but he retired in 1679 on the approach of La Salle, an enemy of the Jesuits. He died among the Miamis on St. Joseph's river. A. contributed much valuable matter to Indian history.

ALLOWANCES, OFFICERS'. In the British army—and to various degrees in the armies of other countries—military officers, besides their recognized pay, receive certain A. for special duties, or when placed under exceptional circumstances. Without detailing the actual amount of these A., it may be well to enumerate the principal modes in which they arise. An officer commanding and paying a troop or company receives a contingent allowance as an indemnification for the expense of repairing arms, swords, and scabbards; for burials; and for the debts of soldiers who become non-effective. A kind of general average is struck for the probable amount of these charges. An officer on duty in the United Kingdom, in a situation entitling him to be lodged at the public expense, and whose lodging is not otherwise paid for by the public, receives an allowance as "lodging-money," varying in amount according to his rank. An officer marching with troops in the United Kingdom, on a route determined by competent authority, if unable to mess with his regiment or detachment on a particular day, receives an allowance in compensation. An officer sent on permanent or temporary duty from one place to another, receives a traveling allowance of so much per mile. An officer serving on a court-martial receives an allowance of so much per day, besides a traveling allowance if the place be distant. An officer temporarily detached on duty, where he cannot join his regimental mess, has an allowance for mess-money. Besides those here enumerated, there are A. for detention at ports of embarkation, etc., and others of a minor kind.

A. or extra payments to private soldiers and non-commissioned officers will be noticed under PAY, PENSION, etc.—The daily food served out at the public expense, which is called a *ration* by soldiers, is more usually known to sailors as an *allowance*. See RATION.

ALLOWAY KIRK, an old ruined church in the parish of Ayr, near the mouth of the Doon, celebrated in Burns's *Tam o' Shanter*. At very short distances from it are the cottage in which the poet was born, the monument erected to his memory in 1823, and "the Auld Brig o' Doon," over which Tam o' Shanter made his escape.

ALLOY (in chemistry) is a mixture of two or more metals, either natural, or produced artificially by melting them together. The A., or mixture, has often different properties from the component metals, and bears a distinct name. Thus, bell-metal is an A. of copper and tin; tombak, of copper and zinc; brass of copper, with a larger proportion of zinc, etc. Alloys are generally harder than the metals that compose them, and this is the motive for alloying the precious metals. Both gold and silver, when pure, are very soft, and easily worn away by use; and therefore, a certain proportion of copper is added, to give these metals the requisite hardness. In this case the word "alloy" signifies the inferior metal added, and not the mixture. For coin, the proportion of copper to be added is fixed by law (see the following article), and differs in different states. It has been found by experiment that  $\frac{1}{12}$  of A. gives the greatest durability. This is exactly the proportion in British gold coin, a pound troy of the metal containing 11 parts gold and 1 part copper. The A. in our silver coin is somewhat less, being 18 dwts. in the pound instead of 20 dwts. For convenience in reckoning, the standard of the coinage in France, and other countries that adopt its monetary system, as well as in the United States, is made  $\frac{9}{10}$  pure metal and  $\frac{1}{10}$  A., usually stated 900 (in 1000) parts fine. Our gold and silver standards similarly stated would be 917 and 925 respectively. Gold is sometimes alloyed with silver, or with a mixture of silver and copper. The color of gold and silver is affected by the nature and amount of the A. A strong A. of copper makes gold red; of silver, green; and a still stronger of silver, a bright yellow. A compound of mercury with another metal is an *amalgam* (q.v.).

Alloys seldom possess the density which theory or calculation from the specific gravity

of their constituents would indicate. Thus, many alloys possess a greater density than the mean density of their constituents, whilst others have a less density. The increase in density of the A. indicates that the metals have contracted; in other words, that the metallic molecules have approached each other more closely; whilst the decrease in density denotes a separation of the molecules to greater distances from each other.

## ALLOYS

which exhibit a greater density than the mean density of the metals composing them.

Gold	and zinc.
"	" tin.
"	" bismuth.
"	" antimony.
"	" cobalt.
Silver	and zinc.
"	" tin.
"	" bismuth.
"	" antimony.
Copper	and zinc.
"	" tin.
"	" palladium.
"	" bismuth.
Lead	and antimony.
Platinum	and molybdenum.
Palladium	and bismuth.

## ALLOYS

which possess a less density than the mean density of the metals composing them.

Gold	and silver.
"	" iron.
"	" lead.

"	" indium.
"	" nickel.
Silver	and copper.
Iron	and bismuth.
"	" antimony.
"	" lead.
Tin	and lead.
"	" palladium.
"	" antimony.
Nickel	and silver.
Zinc	and antimony.

The strength or cohesion of an A. is generally greater than that of the mean cohesion of the metals contained therein, or even of that of the most cohesive of its constituents. Thus, the breaking weight of a bar of copper or tin (meaning the longitudinal strain it can bear) is very much lower than the breaking weight of a bar composed of an A. of tin and copper. The following tables represent the

## COHESION OF METALS.

Bar, 1 in. square, breaks with lbs.	Bar, 1 in. square, breaks with lbs.
Barbary copper.....	22,570
Japan.....	22,570
English black tin.....	20,272

The power of conducting electrical currents is not so great in an A. as the mean conducting power of its components.

The composition of the more commonly occurring and commercially important alloys is as follows: Plumber's solder, 1 tin and 2 lead; soft solder, 2 tin and 1 lead; common pewter, 4 tin and 1 lead; gun metal, 9 copper and 1 tin; bronze, 9 copper and 1 tin and zinc; cymbals and Chinese gongs, 4 copper and 1 tin; bell-metal, 3 copper and 1 tin; speculum metal, 2 copper and 1 tin; pot-metal or cock-metal, 2 copper and 1 lead; gilding metal, 16 copper and 1 to 1½ zinc; Mannheim gold—pinchbeck or bath-metal, 16 copper and 4 zinc; Bristol brass, for soldering, 16 copper and 6 zinc; ordinary brass, for casting, 16 copper and 8 zinc; Muntz sheathing-metal, 16 copper and 10½ zinc; spelter solder, for copper and iron, 16 copper and 12 zinc; spelter solder, for brass-work, 16 copper and 16 zinc; Mosaic gold, 16 copper and 16½ zinc; hardest silver solder, 4 silver and 1 copper;

hard silver solder, 2 silver and 1 copper; soft silver solder, 2 silver and 1 copper; German silver, 100 copper, 60 zinc, and 40 nickel; type-metal, ordinary, 15 lead, 4 antimony, and 1 tin, or 14 lead, 5 antimony, and 1 tin—small types, 4 lead and 1 antimony—large types, 3 lead and 1 antimony; stereotype metal, 48 lead, 6 antimony, and 1 tin; Britannia metal, 50 tin, 4 antimony, 4 bismuth, and 1 copper.

**ALLOY**, or **ALLAY** (in law), the term used to denote the base metal mixture with gold and silver in the coinage of the realm. The gold and silver to be converted into sovereigns, half-sovereigns, shillings, and the other current silver coins, must be of the true standard, or of *sterling* quality, as it is called; and by the statute 25 Edward III. c. 13, all the coin of the kingdom must be made of such sterling metal. By the 56 Geo. III. c. 68, gold coin—with certain exceptions recited in the act—is declared to be the only legal tender for payments, and that such gold coin shall be of the weight and fineness prescribed by the indenture with the master of the mint; and according to the standard thus indicated, the pound troy of gold, consisting of twenty-two carats—or twenty-four parts—fine, and two of A., is divided into forty-four guineas and a half, of the present value of twenty-one shillings each. In the case of silver, the pound troy is declared by the same act—extended by a recent statute, the 12 and 13 Vict. c. 41—to consist of eleven ounces two pennyweights of fine silver, and eighteen pennyweights of A., and in weight to be divided into sixty-six shillings. The regulation of the coinage forms part of the prerogative of the crown, although parliament also exercises a control over it; indeed, since the revolution, the coinage has been chiefly regulated by the authority of parliament. See **COINAGE** and **MINT**.

**ALL-SAINTS' BAY**, in the province of Bahia, Brazil, in 12°-13° s. lat., and 38°-39° w. long. It forms a superb natural harbor, in which the navies of the whole world might anchor. Its length from n. to s. is 3½ m.; its breadth from e. to w. 27. It contains several islands, the largest of which, Itapatica, is 18 m. long and 3 broad. The entrance to the bay is easy. The t. of Bahia (q. v.) lies just within it, on the right hand.

**ALL-SAINTS'-DAY**, in old English, All-Hallows, All-Hallowmas, or simply Hallowmas, a festival of the Roman Catholic church, introduced because of the impossibility of keeping a separate day for every saint. As early as the 4th c., on the cessation of the persecution of the Christians, the Sunday after Easter was appointed by the Greek church for commemorating the martyrs generally; and in the church of Rome a similar festival was introduced about 610 A.D., when the old heathen pantheon (the present rotunda, or Santa Maria del Martiri) was consecrated, on the 13th Mar., to Mary and all the Martyrs. But the real festival of All Saints was first regularly instituted by Gregory IV., in 855, and appointed to be celebrated on the 1st Nov. It was admitted into England about 870. The choice of the day was doubtless determined by the fact that Nov. 1, or rather the eve or night preceding it, was one of the four great festivals (1st Feb., 1st May, 1st Aug., and 1st Nov.) of the heathen nations of the north; for it was the policy of the church to supplant heathen by Christian observances. See **BEITANE** and **HALLOW-EVE**.

**ALL SOULS' COLLEGE**, Oxford, was founded in 1437 by Henry Chichele, sometime fellow of new college, and successively bishop of St. David's and archbishop of Canterbury, for a warden, 40 fellows, 2 chaplains, and clerks. However, by an ordinance framed by the commissioners appointed under the statute 17 and 18 Vict. c. 81, ten of the fellowships have been suppressed in order to the endowment of two professorships, to be called "the Chichele professorship of international law and diplomacy," and "the Chichele professorship of modern history." The remaining fellowships are open to all, irrespective of birth (date or place), position, or profession, provided only the candidates have passed all the examinations required for B.A., and have obtained either some prize or scholarship open to general competition, or a "first-class" place in one of the public examinations of the university. The candidates also must be examined in jurisprudence and modern history. The patronage includes 19 benefices, situated in Kent, Oxford, Essex, Gloucester, Berks, Bucks, Herts, Northampton, Salop, Surrey, and Wilts, of an annual value of £7935. In 1875, this college had 115 members on its books.

**ALL-SOULS'-DAY**, a festival of the Roman Catholic church, which falls on the 2d of Nov. The object of it is by prayers and almsgiving to alleviate the sufferings of the souls in purgatory. It was first instituted in the monastery of Clugny, 993, and the following is the account given of the circumstance in which it originated: A pilgrim returning from the holy land was compelled by a storm to land on a rocky island somewhere between Sicily and Thessalonica. Here he found a hermit, who told him that among the cliffs of the island was situated the opening into the under-world, through which huge flames ascended, and the groans and cries of souls tormented by evil angels were audible. The hermit had also frequently heard the complaints and imprecations of the devils, at the number of souls that were torn from them by the prayers and alms of the pious; they were especially enraged, he said, against the abbot and monks of Clugny. The pilgrim on his arrival acquainted Odilo, abbot of Clugny, with what had come to his knowledge, and the abbot thereupon appointed the day after All Saints to be kept in his monastery as an annual festival for "all soul's." The observance was quickly adopted by the whole Catholic world. By another account, the scene of the incident is transferred to Sicily, and the institution to the year 998.

In some parts of western England it is still "the custom for the village children to go round to all their neighbors *souling*, as they call it—collecting small contributions, and singing the following verses, taken down from two of the children themselves :

Soul! soul! for a soul-cake;  
Pray, good mistress, for a soul-cake.  
One for Peter, two for Paul,  
Three for Them who made us all.

Soul! soul! for an apple or two;  
If you've got no apples pears will do.  
Up with your kettle, and down with your pan;  
Give me a good big one, and I'll be gone.

The soul-cake referred to in the verses is a sort of bun, which, until lately, it was an almost general custom for people to make, and to give to one another on the 2d of November.—*Notes and Queries*, first series, vol. 4.

**ALLSPICE**, a name frequently given to the kind of spice called *PIMENTA* (q.v.) or Jamaica pepper, the fruit of *egenia pimenta* and *E. acris*. The name originated in its being supposed to combine the flavour of different spices, particularly cinnamon, nutmeg, and cloves.—The name *CAROLINA A.*, or *AMERICAN A.*, is given to the aromatic bark of *calycanthus floridus* (see *CALYCANTHUS*), which is employed in the United States as a substitute for cinnamon.—The berries of *benzoin odoriferum*, natural order *lauraceæ*, are said to have been used for *A.* in the same country during the war with Great Britain.

**ALLSTON**, *WASHINGTON*, one of the best known of the painters and poets of America, was b. at George Town, S. C., in 1779. He at first prosecuted the study of medicine, but was afterwards induced, by his acquaintance with the painter Malbone, to devote himself to art. When he had completed his studies in America, he went to London, where he became a friend of his countryman West, who was at that time president of the academy. In the year 1804, he proceeded to Rome, where he lived for some years in the closest intimacy with J. Vanderlyn, Thorwaldsen, and Coleridge. After a short stay in America, to which he returned in 1809, he once more visited England in 1811, when he gained the 200-guinea prize of the British institution. In 1817, he went to Paris with Leslie, and the year after returned to America. In 1819, he was elected an associate of the royal academy of London. He now permanently fixed his residence at Cambridge Port, near Boston, where he lived, cultivating his art, and the muses, till his death on the 8th of July, 1843. His pictures are very numerous. The subjects of them are mostly taken from scripture, such as Jacob's dream, Elijah in the wilderness, Saul and the witch of Endor, the deliverance of Peter out of prison, etc. The style of *A.* is noble, his ideas are imaginative, and many of his paintings evince a true poetic spirit. In coloring, he comes nearer the old masters than most modern painters do. Among his printed works, the most remarkable is the poem, *The Sylphs of the Seasons* (London, 1813), and the art-novel, *Monaldi* (Boston, 1842). His *Lectures on Art* appeared posthumously (1850).

**ALL-THE-TALENTS-MINISTRY**. Lord Grenville's administration, formed after the death of William Pitt, was by its friends claimed as possessing "all the talents," and this phrase, thrown back in derision by opponents, clung to it ever afterwards as an appellation.

**ALLUVION**. This is a legal term, signifying land gained from the sea by the washing up of sand and earth so as to make it *terra firma*. The right of property thus arising is regulated as follows in the laws of England and Scotland: By the law of England, if the addition to the soil thus made be by little and little, by small and imperceptible degrees, it goes to the owner of the land immediately behind; but if the *A.* be a sudden and considerable acquisition from the shore, the ground acquired shall belong to the crown. Where, however, the crown may have made a grant to a subject *cum litore maris*—that is, the space between the high and low water marks—it would seem that a sudden or considerable increase of lands by *A.* within these limits must belong to the grantee. In the Scotch law, again, if the *A.* is made insensibly, it is said to "acresce" to, or become the property of the owner of the ground to which the addition is made; but if it be caused by a violent flood, or by any convulsion of nature, the ground so added to the soil does not belong to the owner of the latter, but remains the property of the person of whose land it originally formed part. The Scotch law does not recognize such right in the crown on this subject as is allowed by the law of England. In Scotland, the shore is not considered to be the property of the sovereign; but it is presumed to be granted as a part and pertinent of the adjacent land, under the burden of the crown's right as trustee for the public uses, of which navigation and fishing are the chief.

**ALLUVIUM**, a term originally applied to those deposits which were supposed to have been formed subsequently to the flood, while diluvium (q.v.), included its products. In modern geological classification, these two terms, in this sense, have been abolished, as their connection with the deluge is denied. The diluvial and alluvial deposits are included under the pleistocene formation (q.v.). The name is now given to those depos-

its of mud, soil, sand, gravel, etc., which are brought down by streams and rivers and spread over lower lands. See DELTA; DENUDATION.

**ALLYGURH**, a fort in the district of the same name in India. Lat.  $27^{\circ} 56' N.$ , long.  $78^{\circ} 8' E.$  It lies on the route between Agra and Delhi, being 55 m. from the former, and 74 from the latter. Partly to this commanding situation, and partly to the strength derived from its surrounding marshes, it owes any importance that it possesses. It was stormed by the British in 1803, being then the principal depot of the French party in the Doab—an exploit of sufficient consequence to be commemorated by a medal in 1851. But within 6 years after 1851, A. became the arena of a still more desperate struggle. Ten days after the outbreak at Meerut, the native troops in garrison mutinied. Fortunately, the Europeans escaped with comparatively little sacrifice of life. But the temporary loss of the place almost cut off the communications between the S.E. and the N.W.—The district of A. (or *Allygurrh*), in the N.W. provinces, has an area of 1964 sq. m.; pop. '73, 1,073,333.

**ALLYL** (Lat. *allium*, garlic) is an organic radical, represented when in combination by  $C_3H_5$ , and when in the free state by  $C_3H_7$ . The first compound discovered was iodide of allyl, which was obtained by Berthelot and De Luca in 1854; two years later, they isolated allyl; and shortly afterwards, Wertheim demonstrated its existence in the oils of mustard and garlic. Its properties, and those of some of its most important compounds, are described in the article GARLIC, OIL OF.

**ALMA**, a river in the Crimea, rising at the foot of the Tchadir Dag, and flowing westward into the bay of Kalamita, about half-way between Eupatoria and Sebastopol. On the steep banks of this stream, through the channel of which the British troops waded amidst a shower of bullets, a brilliant victory was won on the 20th of Sept., 1854, by the allied armies of Britain and France, under Lord Raglan and Marshal St. Arnaud, over the Russian army commanded by Prince Menschikoff.

**ALMACK'S**. A suite of assembly rooms in King street, St. James's. They were built in 1765 by Almack, a tavern-keeper, and were hence called Almack's rooms; \* they are now generally called Willis's rooms, from the name of the present proprietor. The name of A. is chiefly associated with the balls that have, since the opening of the rooms, been held there under the management of a committee of ladies of high rank; and has become synonymous with aristocratic exclusiveness. See *Chambers's Journal*, first series, vol. vi. p. 135.

**ALMA DA**, a t. of Portugal, in the province of Estremadura, on the S. bank of the Tagus, opposite to Lisbon, and distant from it less than 2 m. There is frequent steam-communication with Lisbon. A. is built upon a height, from the summit of which, above the t., there is a magnificent view of Lisbon and the Tagus. A. has a strong castle on a rock. The surrounding country is well cultivated. A. has long been celebrated for its figs. Near it is the gold mine of Adissa. Pop. 5500.

**ALMADEN**, or ALMADEN DEL AZOGUE (Arabic, "the mine of quicksilver"), a t. in Spain, 50 m. S.W. of Ciudad Real, is the *disapora etobria* of the Romans, and is situated between two mountains in the chain of the Sierra Morena. Pop. 9000. It is famous for its exceedingly rich quicksilver mines, producing annually about 1,500,000 lbs. These mines were worked by the ancient Iberians; afterwards by the Romans. They were rented by the Fuggers of Augsburg in the 16th c., but were taken under the care of the Spanish government in 1645. Some years since, the firm of Rothschild undertook the working of these mines. There is a school of mines in the place.

**ALMADEN**, a t. in Santa Clara co., Cal.; pop. '70, 1647. It is noted for the quicksilver mines near by. The deposit was found at an early period by the Indians, who used the crude cinnabar for paint. In 1824, the Spaniards tried to work it for silver. It was first worked for mercury in 1845. The products of two mines (New Almaden and Enriquita), for the year 1873, was nearly 45,000,000 lbs. The value of the mines was rated at \$15,000,000.

**ALMAGEST**, the name given by the Arabs to the great work of Ptolemy the astronomer (q. v.).

**ALMAGRO**, a t. of New Castile, Spain, in the province of Ciudad Real, and 13 m. S.E. from Ciudad Real. It is situated in a high arid plain, but is very well built, with wide paved streets, a fine square, and a public walk lined with trees. Its most noteworthy building is an old church of beautiful architecture. It is a place of greater activity than most Spanish towns, and its whole appearance indicates prosperity. Brandy, soap, and earthenware are manufactured, and lacemaking gives employment to about 8000 women in A. and the neighboring villages. The surrounding country is celebrated for its mules. There are two great annual fairs, at which mules and lace are sold. Pop. 12,605.

**ALMAGRO**, DIEGO D', a Spanish *conquistador*—i.e., adventurer—in the conquest of S. America, was b. in 1745. He was a foundling, and derived his name from the town in the

\* Almack, it is said, was originally a poor Scottish Highlander, named McCall. As a preparatory step to rising into importance in London, he inverted the syllables of his name.

vicinity of which he was found. Along with many other adventurers, he went, as was common in those days, to seek his fortune in the new world which Columbus had opened up. There he amassed considerable wealth by plunder, and became one of the most influential persons in the new colony of Darien, when he was persuaded to join Pizarro in his attack on Peru. The undertaking was crowned with astonishing success. He was now appointed, in the absence of Pizarro, who had returned to Spain with rich presents, governor of the conquered country, and received permission of the Spanish court to conquer for himself a special province s. of the territory subdued by Pizarro. In 1534, therefore, he marched on Chili, penetrated deeply into the land, and returned in 1536, just when the Peruvians had flown to arms under their young inca, Mungo Capac, and shut up the Spaniards in Cuzco and Lima. As these towns lay s. of Pizarro's district, they were claimed by A. He dispersed the Peruvian army before Cuzco, and advanced with his forces against Lima, hoping to make himself sole master of the country. But the crafty Pizarro contrived, by means of a truce, to gain time for collecting his forces. On the 6th of April, 1538, a desperate engagement took place near Cuzco, in which A. was defeated and taken prisoner. He was condemned to death; and on the 26th of the same month, he was strangled in prison, and his corpse beheaded in the market-place of Cuzco. His son, Diego d'A., gathering together several hundreds of his father's followers, stormed the palace of Pizarro, whom he assassinated (1541); he then proclaimed himself capt.-gen. of Peru; but the friends of the murdered governor resisting his claims, Baca de Castro was sent out from Spain, as supreme arbiter, to quell all disturbances. Diego was now requested to submit; and on his refusing, was attacked by the troops of Baca, when the bloodiest battle took place that had ever been known in America (1542). Diego, having been defeated and taken prisoner, was executed along with 40 of his companions.

**ALMALEE**, or **ALMALI**, a large t. of Asiatic Turkey, in the vilayet of Konia. It is situated on the river Myra, about 25 m. from the sea, and is much frequented by European merchants from Smyrna, etc., who purchase the various products of the place. A. has numerous mills propelled by water, tan-yards, dye-works, and factories. The inhabitants are very industrious, and everywhere may be seen indications of their prosperity—in the clean and comfortable houses, neat apparel, excellent roads, fences, bridges, etc. A. is built in a picturesque valley at the edge of a large plateau, 5000 ft. above the sea, and is embosomed in gardens, which, together with the minarets and lofty pillars interspersed through the town, give it a striking appearance. Pop. said to be 12,000.

**ALMA MATER** (Lat., nourishing mother) is a name given to a university in relation to those who have studied at it, to distinguish it from inferior schools of learning. The word *alma* (nourishing, sustaining, or kind) was applied by the Latin authors to such of the deities as were friendly to men—Ceres, Venus, etc., and also to the earth, the light, the day, wine, and the soil.

**AL-MAMŪN**, or **AL-MAMOUN**, **ABŪL-ABBAS-ABDALLAH**, b. 786; a renowned cal. of the Abbasides, son of Harun Al-Raschid. When Harun died, Mamun was governor of Khorassan, and his brother Amin took the Bagdad caliphate; but his treatment of Mamun led to war, and after five years of fighting Amin was slain and Mamun took his place, Oct. 4, 813. The early part of his reign was disturbed by revolts and heresies; but when affairs settled down he fostered the cultivation of literature and science in all his empire, and Bagdad became the seat of academical instruction and the center of intelligence. He had books translated from old and living languages, founded astronomical observatories, determined the inclination of the ecliptic, had a degree of the meridian measured on the plane of Shinar, and constructed astronomical tables of remarkable accuracy. He paid more respect to science than to orthodoxy, and drew his men from all countries and all creeds. This liberalism resulted in the caliph's conversion in 827 to the heterodoxy of the Motasali, who asserted the free will of man and denied the eternity of the Koran. In the latter years of his reign he was in hostilities with the Greek emperor Theophilus; revolts broke out in various parts of his empire; Spain and n.w. Africa asserted their independence, and Egypt and Syria were inclined to follow. In 833, after quelling a disturbance in Egypt, he marched into Cilicia against the Greeks, but died suddenly near Tarsus, leaving his crown to Motassem, a younger brother. Mamun was the author of *Inquiries into the Koran*, a tract on *Signs of Prophecy*, and one on *The Rhetoric of the Priests and Panegyrists of the Caliphs*.

**ALMANAC**, from the Arabic article *al*, and *manah*, to count, a word received by the European nations from the east, denoting a book or table containing a calendar of the civil divisions of the year, the times of the various astronomical phenomena, and other useful or entertaining information. Till a comparatively modern date, this additional matter consisted of astrological predictions and other analogous absurdities; it now embraces, in the best almanacs, a wide variety of useful notes and information, chronological, statistical, political, agricultural, etc.—The Alexandrian Greeks had almanacs. The time at which they first appeared in Europe is not precisely known. The oldest of which copies (in manuscript) still exist, are of the 14th c.; there are specimens in the libraries of the British museum and of Corpus Christi college, Cambridge. The earliest European A. worthy of notice was compiled by the celebrated astronomer Purbach, and

appeared between the years 1450 and 1461; but the first *printed* A. was that composed by his pupil, Regiomontanus, for the thirty years from 1475 to 1506, for which he received a munificent donation from Mathias Corvinus, king of Hungary. Bernard de Granolachs of Barcelona commenced the publication of an A. in 1487; the printer Engel of Vienna, in 1491; and Stöffler of Tübingen, in 1524. Copies of these are now very rare. In 1533, Rabelais published, at Lyon, his A. for that year; and renewed the publication in 1535, 1548, and 1550. The fame and popularity of the celebrated astrologer, Nostradamus, who prophesied minutely the death of Henry II. of France, the execution of Charles I. of England, the great fire of London, the restoration, etc., gave such an impulse to the publication of predictions, that in 1579, Henry III. of France prohibited the insertion of any political prophecies in almanacs—a prohibition renewed by Louis XIII. in 1628. Before this, in the reign of Charles IX., a royal *ordonnance* required every A. to be stamped with the approval of the diocesan bishop.

Prophetic almanacs still circulate to an incredible extent in France in the rural districts, and among the uneducated. The most popular of all these is the *Almanach Liégeois*, a venerable remnant of superstition. It was first published at Liege—according to the invariable title-page which takes no note of time—in 1636, by one Matthieu Laensbergh, whose existence, however, at any time seems very problematical. The *Almanach Liégeois* is a most convenient one for those who are unable to read, for by certain symbols attached to certain dates, the most unlettered persons can follow its instructions: thus the rude representation of a vial announces the proper phase of the moon under which a draught of medicine should be taken; a pill-box designates the planet most propitious for pills; a pair of scissors points out the proper period for cutting hair, a lancet for letting blood. Of course, amidst innumerable predictions, some may naturally be expected to come to pass. So in 1774, this A. predicted that in the April of that year a royal favorite would play her last part. Madame Dubarry took the prediction to herself, and repeatedly exclaimed: 'I wish this villainous month of April were over.' In May, Louis XV. died, and Madame Dubarry's last part was really played. The credit of old Matthieu was established more firmly than ever. In 1852, a number of commissioners, appointed by M. Maupas, minister of police, having examined between 7000 and 8000 of the national chapbooks, which included a great number of almanacs, pronounced them so deleterious, that it became necessary forcibly to check their circulation. Although still in vogue amongst the ignorant peasantry, it is gratifying to learn that their popularity is greatly on the wane, and that various periodicals on a better plan have started up in France of late years.

In England, so far was any restraint from being put upon the publication of prophetic almanacs, or "prognostications," as they were usually called, that the royal letters-patent gave a monopoly of the trade to the two universities and the stationers' company, under whose patronage, and with the *imprimatur* of the archbishop of Canterbury, such productions as *Moore's A.* and *Poor Robin's A.* flourished vigorously; although "it would be difficult to find, in so small a compass, an equal quantity of ignorance, profligacy, and imposture, as was condensed in these publications." The memory of Partridge, long employed as the prophet of the stationers' company, is preserved in the lively diatribe of Swift, writing under the name of Bickerstaff. In 1775, a decision of the court of common pleas, in favor of a bookseller named Carnan, abolished the monopoly of the stationers' company. In 1779, lord North brought in a bill renewing their privileges. After a powerful speech against the measure by Erskine, who exposed the pernicious influence of the productions published under the monopoly, it was rejected. The stationers' company, however, still maintained their ground by buying up all rival almanacs; and it was not until the publication, in 1828, of the *British A.* by the society for the diffusion of useful knowledge, that the eyes of the English public became opened to the irrational and deleterious nature of the commodity which their own indifference or folly, as much as the selfishness of their purveyors, had hitherto maintained in existence. The success of this admirable publication—which still continues to appear annually—stimulated the stationers' company to improvement, and they accordingly published the *Englishman's A.* The *British A.* is itself now published by the stationers' company.

In Scotland the earliest almanacs seem to have been produced about the beginning of the 16th c. Shortly after the beginning of the 17th c. the almanacs or "prognostications" published at Aberdeen had begun to establish that celebrity which is hardly yet extinct. About the year 1677 they were sold for a *plack* each; and the annual circulation amounted, on an average, to 50,000 copies. In 1683, appeared a rival publication, under the title of *Edinburgh's True Almanack, or a New Prognostication*. For a long time Scottish almanacs continued, like all others of that age, to contain little besides a calendar, with a list of fairs, and—what constituted the great attraction—predictions of the weather. But something more instructive and comprehensive became requisite, and the *Edinburgh A.* seems to have been among the first to respond to this requirement of advancing civilization; for, by various editions, such as a list of Scottish members of parliament, it had, in 1745, been extended from the original 16 pages to 36. In 12 years from that date it had swelled to 72 pages; in 1779 it had reached 252 pages. Since 1837, it has been published under the title of *Oliver and Boyd's New Edinburgh A.*, and now extends to above 1000 pages. It contains an amount of information on all public

matters, especially those connected with north Britain, which, in its completeness, leaves little to be desired.

What *Oliver and Boyd's Edinburgh A.* is to Scotland, is *Thom's Irish A.* to Ireland—a work not less excellent, and even more extensive.

Almanacs containing astrological and other predictions are still published in Great Britain, but their influence is extremely limited, even among the most ignorant portion of the community, and their contents are fitted to excite amusement rather than any stronger emotion.

Of important national almanacs are the French *Almanach Impérial*, begun in 1679, a bulky octavo volume, full of useful information; the Belgian *Royal A.*, very similar in character, the Prussian *Royal A.*; and the American *A.*, a very meritorious publication. The *Almanach de Götting*, begun in 1763, has a European, or rather a cosmopolitan, character. See GÖTTA, A. DE.

The most important astrological A. published in Britain is the *Nautical A.*, projected by the astronomer-royal, Dr. Maskelyne, and first published, with the authority of government, in 1767. After his death it gradually lost its character, and in 1830, in consequence of the numerous complaints made against it, the government requested the astronomical society to pronounce upon the subject. The suggestions of the society were adopted, and, in 1834, the first number of the new series appeared, with such additions and improvements as the advanced state of astronomical science rendered necessary. Still older than this A. is the French *Connaissance des Temps*, commenced in 1679 by Picard, and now published under the authority of the *Bureau des Longitudes*. Its plan is similar to that of the *Nautical A.*, but it contains a larger amount of original memoirs, many of them of great value. Equally celebrated is the Berlin *Ephemeris*, published so long under the superintendence of the late prof. Encke, being an improvement on the *Astronomisches Jahrbuch*, conducted by his predecessor Bode.

Another kind of A., which has especially flourished in Germany and France, belongs rather to the class of publications known in Britain as *Annuaire*. Such have been the *Almanach des Muses*, *des Dames*, *Populaire*, *Iconique*, *Napoléonien*, etc., the latter of which were specially devoted to the interests of particular parties, political or religious. Of this kind, the examples in Britain are innumerable, and, in fact, the publication of an A. has now become a favorite medium of advertising and puffery.

The heavy stamp-duty of fifteenpence per copy, to which almanacs were long liable in the United Kingdom, was abolished in 1834, since which time, the character, number, and circulation of this class of publications have strikingly advanced. There is now a very large sale of almanacs in Great Britain for popular use, at not more than one penny each.

ALMANAC is also the term applied by antiquaries to calendars found carved, usually on staves, but also on tablets of wood, scabbards of swords, handles of hatchets, etc. The inscribed characters are sometimes the Runic—hence the name of *runestaffs*, *Scipiones Runici*—and sometimes the Gothic. The saints' days are denoted by symbols, as a pair of shoes for St. Crispin's day. These primitive almanacs were in use among the Scandinavian nations, and the examples of them found in Britain are thought to have been introduced by the Norsemen.

ALMANAC (*ante*). The *American Nautical Almanac* was begun in 1849 by Charles Henry Davis, U. S. navy, and the first volume (for 1855) was published in 1853. It is believed that the first common A. in this country was for 1687, from Bradford's press in Philadelphia. Franklin's *Poor Richard's Almanac*, begun in 1732, was kept up by him about 25 years, and was widely known in this country and abroad for its wise and witty sayings. The *American Almanac*, and *Repository of Useful Knowledge*, was issued in Boston from 1828-'61; a continuation, *The National Almanac*, came out for two years only, 1863-64. In 1878, A. R. Spofford, librarian of congress, began an *American Almanac and Treasury of Facts, Statistical, Financial, and Political*, a comprehensive and valuable work. Political almanacs were headed by *The Whig*, now *The Tribune Almanac*, regularly issued from 1841, and still continued. *The New York Herald*, *Philadelphia Ledger*, and other great journals issue almanacs. Nearly every religious denomination has its special annual, either A. or year-book; and many trades, professions, and enterprises have similar publications. Not the least noticeable are the almanacs of the patent-medicine dealers, in English, German, French, Spanish, and other languages, which are given away by millions.

ALMANSA, a t. of Murcia, Spain, in the province of Albacete, and 43 m. e. by s. from Albacete, on the Madrid and Alicante railway. It is situated in a wide plain, and is tolerably well built, and rather flourishing. The *vega*, or plain around the t. is irrigated by water from a large reservoir called the *Pantano of Albufera*, and is very fertile. Many of its ague-breeding swamps have been drained and brought under cultivation. A. carries on manufactures of linen, hempen, and cotton fabrics, the materials of which are supplied from the neighborhood, also of brandy, leather, and soap. Pop. 8736.—Near A. the French, under the duke of Berwick, natural son of James II. of England, gained a victory, on 25th April, 1707, over an army of Spanish and English troops, commanded by Henry de Ruvigny, earl of Galway. The French were more than twice the number of their opponents. Ruvigny fought under orders

from home, contrary to his own judgment, and was deserted by the Spaniards almost as soon as the battle began. The battle of A. was, in its results, one of the most important in the war of the Spanish succession. See SUCCESSION WARS.

**ALMANSOR**, or, with his full name, Abu-Jafer-Abdallah-ben-Mohammed-al-Mansor (al-mansor, "helped by God"), the second caliph of the house of the Abbasides (q. v.), reigned from 754 to 775. Warfare, treachery, and murder were his steps to the throne, and his whole rule was as cruel as its beginning. He specially persecuted the Christians in Syria and Egypt. In war against external foes he had but little success. He removed the seat of the caliphate from Kufa to Bagdad, which he built at immense cost, raising the money by oppressive taxation. He introduced the pernicious custom of making his freed slaves, mostly foreigners, rulers of provinces. The best feature in his character was his patronage of learning. He caused the *Elements* of Euclid to be translated from the Syriac, and the famous fables of Bidpai (q. v.) from the Persian language. A. d. during a pilgrimage to Mecca, in the 63d year of his age.

**ALMAS**, a t. of the Austrian empire, in Hungary, 16 m. w. from Maria Theresiopol. The inhabitants are almost all Roman Catholics. Pop. '69, 8193.—A. is the name of many small towns and villages in Hungary.

**ALMAZORA**, a t. of Valencia, Spain, in the province of Castellon, 4 m. s. by e. from Castellon de la Plana, in a plain on the left bank of the Mijares, 3 m. from its mouth. It has some wide and well-paved streets and squares. Linen and woolen fabrics and paper are manufactured. The surrounding country is fertile, producing wheat, barley, maize, oil, oranges, etc. Pop. 5150.

**ALMEH**, or **ALMAI**, a class of singing girls in Egypt. To enter the A. one must have a good voice, understand the language well, know the rules of verse, and be able to improvise couplets adapted to circumstances. They are in demand at all entertainments and festivals, and at funerals as hired mourners. They are distinct from the ghawazee, or dancing girls, who are of a lower order, and perform in the streets.

**ALMEIDA**, one of the strongest fortified places in Portugal, is situated on the river Coa, on the Spanish frontier, in the province of Beira. Pop. 2500. In 1762 it was captured by the Spaniards, who soon afterwards surrendered it. Here, in 1810, when the French, under marshal Ney, attempted to cross the Coa into Portugal, the English colonel, Cox, defended the town against marshal Massena; but the explosion of a powder-magazine compelled him to capitulate. In their retreat from Portugal, 1811, the French, under gen. Brenier, destroyed a great portion of the fortifications of A.; which, however, were speedily repaired by the English.

**ALMEIDA**, DON FRANCESCO D', a famous Portuguese warrior, who flourished in the latter part of the 15th and the beginning of the 16th c. He was the seventh son of the count of Abrantes, and at an early period distinguished himself in the wars with the Moors, but especially at the conquest of Granada, in 1492. In 1505, his sovereign, Emanuel I., in consideration of his great abilities, appointed him viceroy of the Portuguese possessions in the East Indies. On the 25th of March he set sail from Lisbon with a fleet of 36 vessels, containing 1500 men, many of whom were noblemen, and all of good family. On the 23d of July he reached Quiloa, on the Mozambique coast, where he was soon involved in a quarrel with the king of that city, the result of which was that A. deprived him of his crown, built a fortress to overawe the inhabitants, and proceeding to Zanzibar, destroyed the t. of Mombaza. He then sailed for the Indies, asserting everywhere the superiority of the Portuguese flag. At Cananor, Cochin, Coulan, Ceylon, and Sumatra, he either built fortresses to protect the factories and commercial interests of his nation, or established new factories. With the king of Malacca a commercial treaty was formed about the same time. His son, Lorenzo, carried on several expeditions as his father's lieutenant, visited Ceylon, and discovered the Maldive islands and Madagascar. The chief design of A. was to make the Portuguese sole masters of the Indian seas, and, by blockading the Persian and Arabian gulfs, to exclude the Egyptians and Venetians from commerce with the east. To frustrate his endeavors, the Egyptian sultan fitted out, by the help of the Venetians, a large fleet, which, under command of the Persian, Mir-Hakim (or Hossein, according to others), was sent to the assistance of the king of Calicut. In the port of Chaul, young Lorenzo was attacked in very disadvantageous circumstances by Mir-Hakim. He fought with astonishing bravery; his ships had all but made their escape out to the open sea, when his own was separated from the others and struck upon a rock; one chance shot carried off one of his legs, and another, tearing away a part of his side, killed him. His father speedily took measures to revenge the death of his son upon the hated Mussulmans, when Alfonso d'Albuquerque appeared on the scene (1507), having been sent out by the Portuguese government to supersede A., whom it had begun to distrust on account of his brilliant successes. The latter refused to recognize Albuquerque as viceroy, and for some months kept him prisoner at Cochin. He now sailed along the coasts, burning and plundering various sea-ports, amongst others Goa, and at length utterly destroyed the Egyptian fleet at Diu. From this fierce and avenging expedition he returned to Cochin, resigned his office into the hands of his successor, and set out on his homeward voyage, Nov. 13, 1508. But he was not destined to see his native land again, for he was slain in an obscure affray with the savages at

cape Saldanha, in the s. of Africa, where his men had landed. He was a man of stern, vigorous, and yet impulsive character, capable of severe retaliation of injuries, but not destitute of clemency and generosity.

**ALMERIA** (Arab. Al-Meryah, "the conspicuous"), anciently Murgis, or *Portus Magnus*, the chief t. in the Spanish province of the same name, at the mouth of the river Almeria. It has a well-defended harbor, a cathedral, besides 26 churches and monasteries, and a grammar school. In the time of the Moors it was, next to Granada, the richest and most important t. in the kingdom, and flourished alike in arts, industry, and commerce, being the "great port" of traffic with Italy and the east. At one time, it was as terrible a nest of pirates as Algiers itself, under the Moorish chief Ibn Mayman, when even Granada, according to the proverb, was merely its "farm." Now it has only a few trifling manufactures, although it still keeps up considerable trade in cochineal, red silk, lead, grapes, and especially wine. The cotton tree has been planted in the environs of A. by English merchants. Pop. 28,000.

**ALMODOVAR DEL CAMPO**, a t. of New Castile, Spain, in the province of Ciudad Real, 23 m. s.w. from Ciudad Real. It stands on the summit of a ridge, near the Vega, a branch of the Guadiana. The streets are tolerably clean, but ill paved. There are ruins of an ancient castle. The inhabitants are chiefly employed in agriculture, and the only manufactures are domestic. Pop. 5620.

**ALMOHADES**, the name of a dynasty that ruled in Africa and Spain during the 12th and 13th c. The word is Arabic, and signifies Unitarians. It was taken as a term of distinction; for the A. considered themselves the only Mohammedans who worshiped God properly. The founder of this sect, which at first was religious rather than political, was called Mohammed Ibn-Toumert, a native of the Atlas region. He was a man of a bold and subtle intellect, and extremely ambitious. He had traveled much, and acquired a manifold knowledge and experience. His first measures were extremely prudent. He commenced preaching with great zeal the reformation of all abuses, affecting himself an austere and unselfish life. He went about covered with rags, prohibiting wine, music, and all pleasures. At first his denunciations were generally held in contempt; but at length his partisans became so numerous, that Ali, king of Morocco, was compelled to take measures against him. It was, however, too late. The Arabs and Berbers flocked to his standard; and at the end of a few years he was master of the provinces of Fez, Morocco, Tlemzen, Oran, and Tunis. Mohammed imposed on his disciples new ceremonies, and composed for their benefit a special treatise entitled *On the Unity of God*. The A. extended their conquests into Spain, subjugating Andalusia, Granada, Valencia, and a part of Aragon, and Portugal as far as the Ebro and Tagus. Mohammed was succeeded in his authority by Abdelmoumen, who had formerly been his lieutenant. Under him and his descendants, Jussuf and Jacob, the dynasty of the A. continued to flourish in great splendor. But in 1212 they were completely defeated by the Spaniards in the famous battle of Tolosa, the result of which was a general revolt of the Christian provinces under their sway. The power of the A. was destroyed in Spain in 1257, and in Africa in 1269.

**AL-MOKANNA**, or MOKENNA. See MOHAMMEDAN SECTS, *ante*.

**ALMOND**, *Amygdalus*, a genus of the natural order *rosaceæ* (q.v.), sub-order *amygdaleæ* or *Drupaceæ*, consisting of trees or shrubs, distinguished by the coarsely furrowed and wrinkled shell (*endocarp* or *putamen*) of the drupe, and by the young leaves being conduplicate, or having their sides folded together. According to the greater number of botanists, it includes the **PEACH** (q.v.), constituted by some into a distinct genus, *persica*, in which the drupe has a fleshy covering (*sarcocarp*), whereas in the species to which the name A. is commonly given, this part is a dry fibrous husk, which shrivels as the fruit ripens, and finally opens of its own accord. The A.-tree (*amygdalus communis*) is very similar to the peach-tree, and is distinguished from it principally, besides the difference of the fruit, by the fine glandulous serratures of the leaves, the stalk of which equals, or even exceeds, in length the breadth of the blade. It is a tree about 20 to 30 ft. high, a native of the east and of Africa, but has now become completely wild in the whole s. of Europe. Even in the more northern parts of Germany and of Britain it is planted for the sake of its beautiful flowers, which are produced in great abundance, and resemble those of the peach in form and often in color, although generally paler and sometimes white. The blossoms appear before the leaves, and are very ornamental in shrubberies in March and April; and even when frosts destroy the germ of the fruit, the brilliancy of the flower is not impaired. The wood of the A.-tree is hard, and of a reddish color, and is used by cabinet-makers, etc. But it is chiefly valued on account of the kernel of its fruit, well known by the name of **ALMONDS**, and forming an important article of commerce, for the sake of which it is extensively cultivated in the s. of Europe and other countries of similar climate. It is mentioned in the Old Testament, and appears to have been cultivated from a very early period. It was introduced into Britain as a fruit-tree before the middle of the 16th c.; but it is only in the most favored situations in the s. of England that it ever produces good fruit.—Almonds are either sweet or bitter. The bitter appear to be the original kind, and the sweet to be an accidental variety, perpetuated and improved by cultivation. **SWEET ALMONDS**

contain a large quantity of a very bland, fixed oil, emulsion, gum, and mucilage sugar, are of a very agreeable taste, and very nutritious, and are used in the dessert, in confectionery, and medicinally in an emulsion, which forms a pleasant, cooling, diluent drink. BITTER ALMONDS contain the same substances, and, in addition, a substance called *amygdalin*, from which is obtained a peculiar volatile oil. (For the oils derived from almonds, see the following articles).—The muddy water of the Nile is clarified by rubbing bitter almonds on the sides of the water-vessels, in the same way in which the nuts of the *strychnos potatorum* (see CLEARING NUT) are used in India. The principal varieties of A. in cultivation are: the common *sweet A.*, with thick hard shell; the *brittle-shelled*, with a very thin, almost leathery, brittle shell, and sweet kernels; the *bitter A.*, with thick hard shell (sometimes also with a brittle shell), and bitter kernels; the *large-fruited*, with large flowers of a whitish rose-color, and very large sweet fruit; the *small-fruited*, with very small sweet fruit; and the *peach A.*, with a slightly succulent blackish *sarcocarp* (see above), yellow shell, and sweet kernels. The *sarcocarp* is, in the different varieties, more or less dry, or somewhat fleshy and juicy, so that some authors have disputed even the specific distinction between the A. and the peach. In commerce the long almonds of Malaga, known as Jordan almonds, and the broad almonds of Valencia, are most valued. Large quantities of almonds are annually imported into Britain and America from France, Spain, Italy, and the Levant. Bitter almonds are brought to Britain chiefly from Mogadore.—The DWARF A. (*A. nana*) is very similar to the common A., except that it is a low shrub, seldom more than 2 or 3 ft. in height. Its fruit is also similar, but much smaller. It is common in the plains of the s. of Russia, and is frequently planted as an ornamental shrub in Britain, flowering freely in March and April, but not producing fruit. It is very beautiful when covered with its pink flowers in spring, and deserves to be more frequently planted than it is. A sheltered but sunny situation is favorable to it.—Other species, little known, but very similar to these, are found in the east, and one on arid hills in Mexico.

ALMONDBURY, an extensive parish and township in Yorkshire, s.e. of Huddersfield: pop. of township, '71, 11,609. There is a free grammar school, founded in 1609; and on a hill near by are the remains of a castle. A. is of great antiquity, and is supposed to have been the residence of some of the Saxon kings.

ALMON'DE, PHILIPPUS VAN, 1646-1711; a Dutch vice-admiral, serving under De Ruyter in the fights of 1666, and after the admiral's death commanding the Dutch Mediterranean fleet, gaining fame in the defeat of the French at La Hague in 1692. He was with Van Tromp in subduing the naval power of Sweden.

ALMONDS, FIXED OIL OF. When almonds are subjected to pressure, a fixed greasy oil exudes. Either bitter or sweet almonds may be employed; but the former are generally used, as they are cheaper than the sweet almonds, and the expressed cake is valuable in the preparation of the *essential oil*. One cwt. of the almonds generally yields 48 to 52 lbs. of the fixed oil. When first obtained it possesses a turbid or milky appearance; but when allowed to stand at rest, the impurities settle, and a clear, light, yellow oil remains above. It has the specific gravity of 918, and solidifies when reduced to  $-13^{\circ}$  F. It has no odor, and to the taste is truly oleaginous and bland. The fixed oil of A. is used in medicine, and possesses a mild laxative property when administered in large doses. It is often given to newly-born infants, mixed with syrup of violets or syrup of roses. It is beneficial, also, in allaying troublesome coughs when administered with confection of roses and syrup of poppies.

ALMONDS, VOLATILE OIL OF, OR ESSENTIAL OIL OF. The cake which is left after the expression of the fixed oil from bitter A., contains, among other matters, a portion of two substances, called, respectively, amygdalin, and emulsion or synaptase. When the cake is bruised and made into a paste with water, the synaptase acts as a ferment upon the amygdalin, and 1 atom of the latter resolves itself into 2 atoms of volatile oil of bitter A., 1 atom hydrocyanic (prussic) acid, 1 atom of grape-sugar, 2 atoms formic acid, and 7 atoms of water. This paste is placed in a retort, and allowed to stand for 24 hours, when heat is cautiously applied and distillation carried on. The volatile oil rises in vapor, and passes over into the receiver, accompanied by much water, and contaminated with a considerable amount of prussic acid. The oil is not originally present in the bitter A.; in fact, the latter do not contain a trace of the oil ready formed, so that the oil is purely the product of the fermentation of amygdalin, 100 parts of which yield 47 of crude oil. Commercial oil of bitter A. has a golden yellow color, but may be purified so as to be almost colorless. The crude oil is very poisonous, owing to the prussic acid dissolved therein, and many fatal cases have occurred from the willful, accidental, and careless use of the oil. It is unfortunate that the manufacturers of the volatile oil should not subject the crude oil to the action of lime and an iron salt, and then re-distill, when the prussic acid would be left fixed by the lime and iron, and the pure volatile oil be alone obtained in the receiver. As so procured, the pure oil is not a dangerous poison. The oil has an agreeable odor, an acrid, bitter taste, and burns with a smoky white flame. It is heavier than water, being of the density of 1088; is soluble in water to the extent of 1 part in 30 parts of water, and is very soluble in alcohol and ether. Heated to  $356^{\circ}$  F., it boils, and distills over unaltered; and, exposed to the air, it is gradually oxidized into benzoic acid. The oil is called by the chemist the hydride of benzoyle. In medicine

the volatile oil is used in place of prussic acid, but is very variable in strength, being sometimes four times the strength of medicinal prussic acid. The dose is a quarter of a drop to a drop and a half in an emulsion. The cook and confectioner employ the oil for flavoring custards, etc., and the perfumer uses it for scenting toilet-soap, etc.

**ALMONER** is the name given originally to that member of a religious order who had the distribution of the money and other things set apart for alms, which, by canonical law, was to amount to at least a tenth of the revenues of the establishment. Afterwards those ecclesiastics also received this name who were appointed by princes to the same office in their households. The grand A. of France was one of the principal officers of the court and of the kingdom, usually a cardinal, and, in right of his office, commander of all the orders, and also chief director of the great hospital for the blind. Queens, princes, and princesses had also their almoners, and bishops were usually appointed to this office. In England, the office of *hereditary grand almoner* is now a sinecure, his only duty being to distribute the coronation medals among the assembled spectators. The *lord high almoner*, who is usually a bishop, distributes twice a year the queen's bounty, which consists in giving a silver penny each to as many poor persons as the queen is years of age.

**ALMONTE**, DON JUAN NEPOMUCINO, 1804-69; a Mexican general and diplomat, of Indian blood in part, and reputed son of Morales. He filled diplomatic positions in the United States, England, Peru, and France. He was captured while on Santa Anna's staff at the battle of San Jacinto in 1836, but was released six months later. He became Mexican minister of war, and during the war with the United States he fought under Santa Anna. At Paris he was active in promoting the French invasion of Mexico and the election of Maximilian. A. was appointed dictator of Mexico in 1862, but was distrusted by all parties, and was removed the same year. The next year he was president of a junta styled the "regency of the Mexican empire." In 1864 he was made regent and grand marshal, and in 1866 he was sent as minister to Paris, where he died.

**ALMOIRA**, the principal t. of the British district of Kumaon (q.v.), India, 87 m. n. from Bareilly, on the crest of a mountain ridge, 5337 ft. above the sea, on the headwaters of the Kosila, a branch of the Ramgunga. It consists chiefly of one street, three quarters of a mile long. The houses have a ground story of stone; the upper stories are of wood, covered with a sloping roof of heavy gray slate, on which small stacks of hay are sometimes erected. The ground story is generally white-washed and tricked out with grotesque paintings. Detached houses, both of Europeans and Brahmans, are scattered along the face of the mountain below the t. A. is a British military station, the lines of the regular troops and fort Moira being close to the t. Since it came under British sway it has been rapidly increasing in prosperity. Pop. '71, 6151.

**ALMORAVIDES** ("the *Moravides*"), or MORA-BETHUN, the name of an Arab dynasty that ruled in Africa and Spain in the 11th and 12th c. of the Christian era. The name A., which is commonly given to this dynasty by western writers, is a corruption of the Arabic word *Al-morabith*, "the champion of religion." This sect took its rise about 1050 among the Arab and Berber tribes which dwelt on the slopes of the Atlas range facing the Atlantic, and was founded by a Moslem teacher called Abdalla-ben-Yasim, who undertook to rescue these tribes from the gross ignorance in which they were plunged, and instructed them in the doctrines of the Mohammedan faith. The new proselytes soon exhibited the fruits of this teaching by descending from their hills, under the leadership of a chief named Abu-bekr, and conquering the kingdom of Fez. The adjoining kingdom of Morocco shared the same fate; and the victorious enthusiasts, under the famous Yussuf-ben-Taxfin, the cousin of Abu-bekr, next crossed the strait of Gibraltar, and subdued Spain to the Tagus on one side, and to the Ebro on the other. But this extensive and powerful dominion was of too rapid growth to possess much stability; and during the reign of Ali, the son of Yussuf, arose the sect of the Almohades (q.v.), which after a time expelled the A. from Africa, and in 1144 subdued their power in Spain. It was the Almoravide princes who introduced the *Maravedi* (q.v.) into Spain, and in that and the word *Marabuts* (q.v.) their name is still preserved.

**ALMQVIST**, KARL JONAS LUDWIG, 1793-1866; a native of Sweden, remarkable in the history of literature. He quitted the university to lead a colony into the wilds of Wermeland; but the utopian colony was a failure; and he settled in Stockholm as a writer, producing several educational works and rising at a bound into fame by his novel *The Book of the Thorn-Rose*. He ran rapidly on with astonishing fecundity of brain, producing lyric, epic, and dramatic poems; philosophical, æsthetical, moral, political, and educational treatises; works on religion, lexicography, history, mathematics, and philology, all good and most of them excellent. He left one political piece after another, and was living entirely by literary efforts, when he suddenly became an extreme socialist. The public was astonished in 1851 to learn that he had been convicted of forgery and charged with murder, and had fled from Sweden. For many years he was not traced, living in the United States under an assumed name, having the fortune to be for a long time private secretary to president Lincoln. After the president's death, A. fell again into trouble; his manuscripts, including several unpublished novels, were confiscated and destroyed, and he escaped to Europe under a new alias. His strange career ended at

Bremen in 1866. His romances, as a whole, are considered the best in the Swedish language.

**ALMUG TREE**, or **ALGUM TREE**. This name, occurring in the Old Testament, was formerly supposed to denote a species of *acacia*, or a coniferous tree like the cypress; but it is now thought more probable that it was one of the kinds of sandal-wood (q.v.), the *santalum album*, a native of India.

**ALMUNECA** (Arab. *Al Munneca*, the gorge), a seaport town of Andalusia, Spain, in the province of Granada, 31 m. s. of Granada. The port is somewhat exposed. The t. is generally well built. It was a place of importance in Moorish times, when the coast of Granada was highly cultivated and extremely productive, particularly in sugar and cotton. Efforts have recently again been made to extend the culture of both. The inhabitants of A. are chiefly engaged in agriculture and sugar refining. There is a considerable trade in cotton, sugar, and fruit. Pop. 5000.

**ALMY**, JOHN J., b. R. I., 1814; chief signal officer of the U. S. navy. He began as a midshipman, and rose to be commodore in 1863. He was on blockade service during the rebellion.

**ALMY**, WILLIAM, 1761-1836; a Quaker philanthropist, who used much of his fortune in charitable works in Providence, R. I. He endowed the New England boarding-school, and defrayed the cost of educating 80 students.

**ALNUS**. See **ALDER**.

**ALNWICK** (t. upon the Alne), the co. t. of Northumberland, is situated in lat. 55° 25' n., long. 1° 42' w., and is distant about 34 m. from Newcastle. The streets are broad, well paved, and well lighted, the houses modern, built of stone, and in some instances handsome. A large market-place occupies the center of the town. The town-hall is a spacious building crowned with a tower. A. was at an early period a fortified t., and some fragments of the ancient walls even yet remain. An ancient gate, built by Hotspur, still forms one of the entrances to the city. A. castle, the residence of the dukes of Northumberland, stands at the n. entrance of the town. It was repaired some years ago, and is considered one of the most magnificent baronial structures in England. During the middle ages it was a bulwark against the invasions of the Scots, who thrice besieged it. A. is the election t. for the n. division of the county. It has various charity schools, a mechanics' institute, a theatre, a town-hall, and a corn exchange. Pop. '71, 6218.

**ALOE** (*aloe*), a genus of plants belonging to the natural order *Ullaceae* (q.v.) sub-order *aloinae*, distinguished by a regular cylindrical perianth in six pieces, expanded at the mouth, and nectariferous at the base, the stamens hypogynous, or springing from beneath the germen, the ovules indefinite in number, the fruit a membranous three-celled capsule. The species are numerous, natives of warm countries, especially of the southern parts of Africa. About 50 m. from Cape Town is a mountainous tract completely covered with aloes, and the hills on the w. side of Socotra exhibit them in similar profusion. The species all have stems, but vary in height from a few inches to 30 ft. They have permanent succulent leaves. The negroes of the w. coast of Africa make cords and nets of the fibers of their leaves, and stockings are woven from the fibers of a species found in Jamaica. But aloes are chiefly valuable for their medicinal properties. The well-known drug called **ALOES** (q.v.) is the inspissated juice of the leaves of several almost tree-like species, and particularly of *A. socotrina*, a native of the island of Socotra; *A. purpurascens*; *A. spicata*, and *A. fruticosa*, which principally yield the cape aloes; *A. Indica*; *A. rubescens*; *A. Arabica*; *A. linguaformis*; *A. Commelini*; and *A. vulgaris*, which is found in the East and West Indies, in Italy, and in some of the islands of the Mediterranean, being the only species which can be reckoned European, although it also is probably an introduced plant. The extract prepared from its leaves is known as hepatic aloes, or as Barbadoes aloes. The bitter principle of aloes has been called alcesin. It forms several compounds with oxygen, which possess the properties of acids. The juice of aloes was anciently used in embalming, to preserve dead bodies from putrefaction. In the East Indies it is employed as a varnish to prevent the attacks of insects; and has even been applied to bottoms of ships to protect them from marine worms. A beautiful violet color is obtained from the leaves of the Socotrine A., which does not require any mordant to fix it. It also affords a fine transparent color for miniature painting.—Mohammedan pilgrims suspend an A. over their doors on their return from Mecca, to signify that they have performed the pilgrimage.

The AMERICAN A. is a totally different plant. See **AGAVE**.

**ALOE** is a drug of great antiquity, for we find Dioscorides (50 A.D.) making mention of *aloe* as a substance obtained from a plant, and possessing cathartic properties. The great demand for A. in Britain has led to its importation from numerous sources, including Bombay, Arabia, Socotra, Madagascar, the cape of Good Hope, the Levant, and the West Indies. The drug is the inspissated juice of various species of aloe (q.v.). All these are characterized more or less by producing large, thick, fleshy leaves, stiff and brittle, pointed, and generally terminating in a strong spine, filled with a mucilaginous pulp internally, and containing in the proper vessels of their exterior portion an intensely bitter juice, which yields the medicinal substance A. It is obtained, sometimes in the

form of tears, by incision, spontaneous exudation, and inspissation upon the plant; sometimes by spontaneous evaporation of the juice which drops or exudes by pressure from the leaves when cut away near the base; sometimes by evaporating the same juice with the aid of heat; and lastly, by evaporating together the juice and the decoction of the leaves.

Owing to the great difficulty of determining the true botanical source of any given sample, the following names are made use of in commerce to denote the various kinds of A. found in the market—namely, Socotrine, Clear, Cape, East Indian, Barbadoes, and Caballine A. The most important are:

1. Socotrine A. (*Aloë Socotrina*), so called from its supposed source, the island of Socotra, near the mouth of the Arabian gulf. This is the most esteemed of all the varieties used in medical practice. Many hold that this is only a fine variety of East Indian A., but the characters given in the *Edinburgh Pharmacopœia*—a garnet-red translucency in thin pieces, and almost complete solubility in spirit of the strength of sherry—define a particular species, which is the true Socotrine A. of pharmacologists.

2. East Indian A. (*Aloë Indica*), also called hepatic A., from its liver-brown color, is imported into Bombay from Arabia and Africa, and is known in India by the name of Bombay A. A considerable portion is probably obtained from the same sources as the Socotrine A., which it resembles in color; and according to Dr. Pereira, "the two are sometimes brought over intermixed, the Socotrine occasionally forming a vein in a cask of hepatic A."

3. Barbadoes A. (*Aloë Barbadosensis*) is prepared in the West Indies from *A. Socotrina*, and from a variety of *A. vulgaris*. We learn from Browne's *Natural History of Jamaica* that the largest and most succulent leaves are placed upright in tubs, that the juice may dribble out. This evaporated, forms what is sold as Socotrine A.; but the common A. is obtained by expressing the juice out of the leaves, boiling it with water, evaporating and pouring it into gourds; whence this kind is often called gourd A. It is much used for veterinary medicine, and thus brings a high price in the market.

Caballine A. (*Aloë caballina*) is a very coarse kind, and is so called because it is considered fit only for horses. It contains many impurities, such as wood, sand, and charcoal, and evidently constitutes the lowest stratum in the vessels in which the better sorts are allowed to cool. It is now in a great measure superseded in veterinary practice by Barbadoes A.

All kinds of A. are remarkable for their disagreeable taste. The odor is peculiar, and is more perceptible when the drug is breathed upon. A. is in a great measure soluble in water, and more so in hot than cold water. A. was formerly considered to be a gum-resin; but the portion which was thought to be of the nature of gum is now regarded as a variety of *extractive*, and to it the name of aloesin has been given.

*Action*.—When employed in small doses, A. exerts a tonic, and in larger doses, a cathartic action. It is considered by some authorities to stimulate the liver, and also to supply the place of deficient bile in torpidity of the intestinal canal, and more especially towards its lower part. Both taken singly, and also in combination with other cathartics, A. is perhaps the most important and the most extensively used of vegetable remedies of its class; and there is no end to the variety of cases in which it may be employed with advantage.

**ALOES WOOD** (called also *agila wood*, *eagle wood*, or *agallochum*) is the inner part of the trunk of *agilaria ovata* and *A. agallochum*, trees of the natural order *agulariaceæ* (q.v.), natives of the tropical parts of Asia, and supposed to be the aloes or lign aloes of the Bible. They are large spreading trees with simple alternate leaves. Aloes wood contains a dark-colored, fragrant, resinous substance, and is much prized in the east as a medicine, and for the pleasant odor which it diffuses in burning. It has been prescribed in Europe in cases of gout and rheumatism. The resinous substance is found only in the inner part of the trunk and branches; the younger wood is white, and almost scentless. A similar substance, still more esteemed, is obtained in the south-eastern parts of Asia and the adjacent islands, from the central part of the trunk of *aloeylon agallochum*, an upright-growing tree with simple alternate leaves, and terminal panicles of small flowers, of the natural order *leguminosæ*, sub-order *cesalpinieæ*. This tree abounds particularly on the highest mountains of Cochin-China and the Moluccas; a character of sacredness is attached to it, and it is cut with religious ceremonies. The A. W. which it yields is not only much prized in the east as a perfume, but many medicinal virtues are ascribed to it. The ancients ascribed to it similar virtues, and so valued it for these and its fragrance, that Herodotus says it once sold for more than its weight in gold. It was regarded almost as a universal medicine. Its very fragrance was supposed to have a beneficial influence, and it was therefore worn about the person. As it admits of a high polish, and exhibits a beautiful graining, precious gems were set in it; and it was cut into fantastic forms and worn in head-dresses, etc. There seems to be allusion to a similar use of it in Psalm xlv. 8, "All thy garments smell of myrrh and aloes and cassia." Or perhaps this merely refers to its being employed to perfume clothing. It was also from a very early period much used to perfume the apartments of the great. The fragrance continues undiminished for years. *Lign aloes* is a corruption of *lignum aloes* (aloes wood).

**ALOÏDÆ**, or **ALOÏADÆ**, the name of Otus and Ephialtes, legendary sons of Neptune by Iphimedeia, wife of Aloeus. They were celebrated for gigantic stature, being 27 cubits high and 9 broad when but 9 years of age. In the war with the gods they piled the mountain Pelias upon the mountain Ossa, intending to pile both upon Olympus in their effort to scale heaven. Homer says Apollo destroyed them before their beards had grown. Apollodorus says they did pile up the mountains, threatening to change sea into land. It is said they aspired to secure the goddesses for wives, one suing for the hand of Hera, the other for Artemis; but Artemis appeared to them in the form of a stag, running between them; when both shot at the supposed animal, and each killed the other.

**ALOM'PRA**, **ALOUNG P'HOURA**, 1711-63; founder of the reigning dynasty of Burmah. At first he was a petty chief in his native village. An invasion by the king of Pegu, in 1752, gave him opportunity, and he rapidly rose to the highest distinction by boldly opposing the conquering invader, recovering Ava before the close of 1753. When the king of Burmah was slain in 1754, the son claimed the throne, but A. resisted and established his own authority. In 1755, he founded Rangoon, and two years later was known as one of the most powerful rulers of the east by his invasions and conquests of Pegu. Some insurrections followed, in one of which there was a massacre of English, but the responsibility has never been traced to A. He died when he was about to besiege the Siamese capital.

**ALONG-SHORE**, a phrase applied in navigating near a coast, to denote a passage near to, and parallel with, the shore. "Along-shore-men," or "long-shore-men," is a peculiar designation given to some of the humbler and rougher men employed about docks and shipping, in the Thames and other rivers.

**ALOOF**, at sea, is simply "at a distance." To "keep the loof," or "keep the luff," is a command given to the man at the helm.

**ALOPECURUS**. See **FOXTAIL**.

**ALORA**, a t. of Andalusia, Spain, in the province of Malaga, 18 m. n.w. of Malaga, on an elevated site near the right bank of the Guadalhorce. Some of the streets are well built and well paved; some are very steep and irregular. There are ruins of an ancient Gothic castle. The inhabitants are mostly employed in agriculture. Soap and sulphate of soda are manufactured. The neighborhood produces much oil and excellent wine. Pop. 6794.

**ALOSA**. See **CLUPEIDÆ** and **SHAD**.

**ALOST**, or **AALST** (the name signifies "to the east," and was probably given to the town because it lay near the eastern frontier of the province), a t. in Belgium, the old capital of the province of east Flanders, is situated on a tributary of the Scheldt, called the Lender, which is here converted into a canal. It is a walled city with five gates, has considerable trade in hops, corn, etc., and large manufactures, besides numerous breweries, distilleries, bleach-works, print-works, copper and iron foundries, flax and cotton mills, etc. The finest building in A. is the church of St. Martin, an unfinished edifice, but one of the grandest in Belgium, and containing a famous painting by Rubens—"St. Roch beseeching our Saviour to stay the Plague of A.," and also the mausoleum of Thierry Martens, who was born here, and who introduced the art of printing into Belgium, 1475 A.D. A. has a town-hall (founded in 1300 A.D., a college, a hospital, chamber of commerce, academy of design, etc. Pop. 19,000.

**ALOY SIA**, a genus of plants of the natural order *verbenaceæ* (q.v.), to which belongs a shrub, *A. citriodora*, much cultivated in greenhouses and apartments in Britain for the grateful fragrance which its leaves emit when slightly bruised. It is frequently to be seen in the windows of cottagers, and is by them generally named *verbena*. It was formerly known to botanists as *verbena triphylla*, and has also been referred to the allied genus *lippia*. The leaves are in whorls of three. It is a native of Chili. In the Channel islands and the s. of Ireland, it becomes a luxuriant shrub in the open air, reaching a height of 10 to 25 ft., with osier-like shoots.

**ALP**, **ALB**, also called the Raube or Swabian Alp, is a chain of mountains above 60 m. in length, and from 12 to 15 in breadth, situated between the Neckar and the Danube. It forms the water-shed between these two rivers and the basin of the Rhine, and lies almost entirely within the kingdom of Würtemberg. It is also in the vicinity of the Black Forest, but presents a totally different appearance, on account of its being clothed with forests of hard wood instead of pine. It forms a table-land intersected by a few narrow deep valleys. The average height of the system is rather more than 2000 ft. On the n., it descends to the Neckar in ridges of rocky cliffs, and abrupt pointed headlands; but on the s., it gradually slopes away to the level of the valley of the Danube. The scenery is often very picturesque, for the sharp, precipitous crags are frequently crowned with the strongholds, generally ruins of the famous old German families, such as the Hohenzollerns, Hohenstaufens, etc. The geological formation of the A. is calcareous, and presents a regular stratification. Caverns of a very remarkable character abound among the rocks. The valleys at the base of the hills are fertile, and produce

abundance of wine and fruit, but the high table-land has an extremely poor and barren soil.

**ALPACA**, or **PACO** (*auchenia paco*; see **AUCHENIA**), an animal of the same genus with the llama (q.v.), and so closely allied to it, that many naturalists regard it as a variety rather than a distinct species. It is remarkable for the length and fineness of the wool, which is of a silken texture, and of an uncommonly lustrous, almost metallic appearance. The A. is smaller than the llama; the legs and breast are destitute of callosities. In form, it somewhat resembles the sheep, but with a longer neck and more elegant head. It carries its long neck erect; its motions are free and active, its ordinary pace a rapid bounding canter. The eyes are very large and beautiful. The wool, if regularly shorn, is supposed to grow about 6 or 8 in. in a year; but if allowed to remain upon the animal for several years, attains a much greater length, sometimes even 30 in., and not unfrequently 20. Its color varies; it is often yellowish brown; sometimes gray, or approaching to white; sometimes almost black.

The A. is a native of the Andes, from the equator to Terra del Fuego, but is most frequent on the highest mountains of Peru and Chili, almost on the borders of perpetual snow, congregating in flocks of one or two hundred. In a wild state it is very shy and vigilant; a sentinel on some elevated station gives notice of the approach of danger by snorting to alarm the flock. Alpacas seem instinctively to know when a storm is coming on, and seek the most sheltered situation within their reach. Flocks, the property of the Peruvian Indians, are allowed to graze throughout the whole year on the elevated pastures, and are driven to the huts only at shearing-time. When ore is separated from the rest, it throws itself on the ground, and neither kindness nor severity will induce it to rise and advance alone. It is only when brought to the Indian huts very young, that they can be domesticated so as to live without the companionship of the flock; but then they become very bold and familiar. Their habits are remarkably cleanly.

The Indians have from time immemorial made blankets and ponchos or cloaks of A. wool. It is not quite fifty years since it became an article of commerce, but its use for the manufacture of shawls, coat-linings, cloth for warm climates, umbrellas, etc., has gradually increased, and more than 2,000,000 lbs. are now annually imported into Britain. The credit of introducing and raising to its present magnitude the A. wool-manufacture in Britain, is due to Sir Titus Salt.

Attempts have been made to introduce the A. into Europe; but not yet with very satisfactory results. The only considerable flock known to exist is in the Pyrenees. There seems no reason, however, to doubt that the mountains of Wales and Scotland are suitable for this branch of husbandry; and it is to be hoped that enterprise such as has been directed to the manufacture of A. wool in Britain, will soon, and with equal success, be directed to the production of it. There are probably not yet more than two or three hundred alpacas in Britain, and these mostly in parks connected with the residences of noblemen and gentlemen, not in the situations for which they seem to be peculiarly adapted. An attempt was made in 1821 to introduce the A. into the United States; a fund was raised, and, in 1857, a cargo of them was shipped to Baltimore, but the result showed that they could not be acclimatized.

A. wool is straighter than that of the sheep, very strong in proportion to its thickness, and breaks little in combing. The fiber is small, and it is very soft, pliable, and elastic. —The flesh of the animal is said to be very wholesome and pleasant.

**ALP-ARSLAN**, a Persian sultan, the second of the Seljukide dynasty, b. in Turkestan in 1028 or 1030. In 1053, he ascended the throne of Khorassan, after the death of his father Daoud, and in 1063 he also succeeded his uncle. His first act was to unite the whole of his dominions in one vast monarchy. He next embraced Islamism, and it was on this occasion that he took the surname of Alp-Arslan (the lion-heart), his real name being Mohammed-Lhaz-ed-Dyn-Abou-Choudja. The caliph of Bagdad gave him the title of Adhad-eddin (defender of the faith), with this extreme honor—namely, that prayer should be made in his name. He had an excellent vizier, Nisam-al-Mulk, one of those lettered ornaments of early Mohammedanism. This vizier was the founder of all the colleges and academies in the kingdom. While he directed the internal administration of affairs, A. made war successfully. He suppressed revolts, and extended the northern boundaries of his dominions. In 1067 and 1068, he pursued the course of his conquests, carrying off the gates of the church of St. Basil at Casarea, which were enriched with gold and pearls, and overthrowing the Greeks under Nicephorus Botoniates. In 1069, he invaded Armenia and Georgia, at that time Christian kingdoms. The most remarkable incident in this expedition was the blockade of the convent of Mariam-Nishin, situated on an island in the middle of a lake, and considered impregnable. An earthquake overthrew the walls during the siege, when it immediately surrendered. He next proceeded against the Greeks, who, under their brave emperor, Romanus IV., had thrice driven back the Turks beyond the Euphrates. In Aug., 1071, a bloody battle was fought near the fortress of Malaskerd, between the towns of Van and Erzeroum. A. gained the victory. The Greek emperor was taken prisoner, and only obtained his liberty by a ransom of £1,000,000, and an annual tribute of £160,000. Rather more than a year after this (Dec. 15, 1073), A. perished at Berzem in Turkestan by the poniard

of Jussuf Cothuol, whom he had insulted. He was buried at Mervé, in the tomb of his ancestors.

ALPENA, a co. in n.e. Michigan, on lake Huron, drained by Thunder Bay river: 700 sq.m.; pop. '74, 4807. It is heavily timbered: agriculture and lumbering are the main occupations. Co. seat, ALPENA, at the head of Thunder bay, 210 m. from Detroit. Pop. '70, 3964.

ALPES is the name of two departments in France, the *Basses-Alpes* (or lower Alps) and the *Hautes-Alpes* (or upper Alps). The department of the BASSES-ALPES occupies the n.e. part of Provence, and includes an area of 2630 sq.m. It is, for the most part, mountainous, consisting of spurs or offshoots from the Maritime Alps, which run in numerous chains towards the Rhone. In the n. the climate is cold, the soil poor, and the cultivation bad; in the s., the climate is much better—almonds, apricots, peaches, and various other choice fruits are grown, amongst which the plums of Bignolles form a well-known article of commerce. The wines of this region are reckoned excellent. On the sides of the Alps oxen and sheep find admirable pasturage. The mines produce lead, green marble, etc. At Digne and Gréoulx there are hot mineral springs. Pop. '76, 136,166; the trade carried on is insignificant. The department is watered by the Durance. The chief t. is Digne: pop. 5340.

The HAUTES-ALPES, lying n. of the Basses-A., and forming a part of the old province of Dauphiné, is traversed by the chief range of the Cottian Alps, which here rise, in Mt. Pelvoux, to the height of 14,000 ft., and Mt. Olan to 13,120 ft. The scenery, especially along the course of the impetuous Durance, is singularly picturesque. The *Hautes-A.* is the highest department in France; the fierce n. wind and the perpetual snow on the lofty peaks, make the climate severe and the winter long, so that the barren soil will yield little else than potatoes, a little rye, oats, and barley. Here and there, in the most southerly valleys, nut-trees, chestnuts, vines, and other choice fruits, thrive. Only horned cattle, asses, and mules are bred profitably. The most important roads through this department are: 1st, The road from Grenoble to Briançon; 2d, The road from Briançon to Susa, in Piedmont, over the Col de Genevre, which, in 1859, was used to transport masses of French soldiery into Italy; 3d, The road from Gap to Marseille. The area is 2150 sq.m.; pop. '76, 119,094. The inhabitants are employed in the manufacture of leather, linen, and woollens. A number are likewise engaged in the mines, which produce lead, copper, iron, and anthracite. Chief t., Gap; pop. 7349.

ALPES MARITIMES, a dep. of France, in the extreme s.e., on the shores of the Mediterranean and confines of Italy, formed in 1860, of the ancient co. of Nice, then ceded to France, and formerly belonging to the kingdom of Sardinia, and of the arrondissement of Grasse, detached from the department of Var. The chain of the A. M. forms the northern boundary of the department, and from it numerous spurs run seaward, among which are lovely and fertile valleys. The chief rivers of the department are the Loup, the Var, and the Paillon, at the mouth of which Nice is situated. The climate is mild and pleasant in the vicinity of the sea, and in the lower valleys, although the higher mountains reach to altitudes where winter always reigns. The vine and olive are much cultivated in the more favored localities; oranges, lemons, and figs are produced in abundance and of excellent quality; a considerable extent of land is devoted to tobacco, and not a little to the cultivation of herbs and flowers for the preparation of essences and perfumes. Grasse is particularly famous for the manufacture of perfumery. In many parts of the department, there are noble forests. In the more elevated parts, much land is used for the pasture of sheep, and also of goats, of which these regions possess a highly esteemed breed. The silk-worm is reared to a considerable extent, and the keeping of bees is a source of no little wealth, honey being largely produced and exported. The mineral riches are not great. There are some quarries of white marble, and some mineral springs. Among the chief branches of industry, besides those which are strictly rural, are brass-founding and the making of bijouterie. The tunny, anchovy, and sardine fisheries give employment to many people on the shores of the Mediterranean, and great quantities of anchovies and sardines are exported from the port of Cannes. The department is divided into three arrondissements—Nice, Puget-Théniers, and Grasse. The capital is Nice (q.v.), and the other principal towns are Antibes (q.v.), Villefranche, Cannes (q.v.), Grasse (q.v.), and Menton, or Mentone (q.v.), on the eastern frontier.—The co. of Nice was bestowed in 1388 on Amadeus VII., duke of Savoy, and latterly formed part of the kingdom of Sardinia till 1860, except that it was seized by France in 1792, and for a time formed into the department of Alpes Maritimes. It was restored to Sardinia in 1815. After the treaty of 1860 was concluded, it was apprehended that the people of this region, on account of their race, customs, and language, would not show the same willingness to be transferred to France as the people of Savoy; but no transference of territory was ever more easily accomplished, or with less apparent dissatisfaction of those most nearly concerned. The pop. of the dep. in 1876 was 203,604.

ALPHABET. The A. of any language is the series of letters, arranged in a fixed order, with which that language is written. Picture-writing was doubtless the earliest method invented of conveying thought through the eye. The idea of an ox was readily expressed by a sketch of the animal, or, for shortness, by an outline of his head and

horns. Or the picture was used symbolically; as the figure of an eye, to express the action of seeing, or the attribute of wisdom. In process of time, some of those pictures came to be used phonetically—i.e., to represent, not ideas, but sounds. But the sounds so represented would at first be whole words, or, at all events, syllables; and the important step was yet to be taken of analyzing syllables into their elementary sounds, and of agreeing upon some one unvarying picture or sign (a letter) to represent each. This constituted the invention of the A. By what steps alphabetic writing most probably rose out of picture-writing, will be seen under the head of **HEROGLYPHICS**. See also **CHINESE LANGUAGE** and **CUNEIFORM CHARACTERS**.

The Phœnician A. is the oldest of which we have any account; and from it have originated, directly or indirectly, all the modes of writing now in use in the world. It is the foundation of the Greek, the Latin, and the Arabic alphabets; and the great influence of the nations speaking these tongues accounts for the wide-spread similarity. Taking both ancient and modern times into account, as many as 400 alphabets have been enumerated; but of those now in use, if we set aside slight variations of form, the number does not exceed 50. Auer's *Sprachhalle* (Vienna, 1849) contains a rich collection of alphabets. We must confine ourselves here to those more immediately connected with the history of the English A.

A point of considerable importance is the *order* of the letters. In modern alphabets, this appears at first sight to be quite arbitrary; but traces of a principle of arrangement, or natural system according to which the series grew, have recently been brought to light.\* The evidences of such a natural order are best seen in the Hebrew A., which was almost identical with the Phœnician. The following table exhibits the Hebrew letters, with their names, and sounds or powers; and also the names of the letters composing the early Greek A., as borrowed from the Phœnician:

HEBREW.			GREEK.
	Name.	Sound or Power.	
1	א Aleph,	a vowel or breathing.	Alpha.
	ב Beth,	B.	Beta.
	ג Gimel,	G (gun).	Gamma.
	ד Daleth,	D.	Delta.
2	ה He,	a vowel or breathing.	E(psilon).
	ו Vau,	V or F.	F=V (digamma).
	ז Zayn,	Z.]	Zeta.
	ח Kheth,	KH or CH.	Eta.
	ט Theth,	TH.	Theta.
	י Yod,	J.	Iota.
3	כ Kaph,	K, variety of.]	Kappa.
	ל Lamed,	L.	Lambda.
	מ Mem,	M.	Mu.
	נ Nun,	N.	Nu.
	ס Samekh,	S, variety of.]	Sigma.
	ע Ayn,	a vowel.	O(mikron).
4	פ Pe,	P.	Pi.
	צ Tsadi,	TS.]	
	ק Koph,	K or Q.	Koppa.
	ר Resh,	R.]	Rho.
	ש Sin,	S.]	San.
	ת Tau,	T.	Tau.

Leaving out of account the letters inclosed in brackets, which are not easily accounted for, and are possibly later interpolations, the whole fall into four groups, the law of which will best appear in the following scheme:

Vowels.	Labials.	Palatals.	Dentals.	
a	b	g	d	Flats or medials.
e	v	ch	th	Aspirates.
o	p	k	t	Sharps.
i	l	m	n	Liquids.

\*The theory was first propounded in 1833, by prof. Key, of University college, London, in the *Penny Cyclopædia*, art. 'Alphabet.'

Without entering at present into the nature of the relation between the letters in the several rows horizontal and vertical, of the scheme (for which see LETTERS), it will be seen that group (1) in the Hebrew A. consists of a vowel followed by three mute letters, all having one character (flats or medials); that group (2) consists of a vowel followed by three mutes, also having one character (aspirates); and that group (4) consists in like manner of a vowel followed by three mutes, all of the same character (sharps). The order, moreover, according to the organ of utterance, in which the mutes follow in each group, is invariable: the labial (lip-sound) coming first; the palatal (palate-sound), second; and the dental (tooth-sound), last. This principle of arrangement is characterized by Dr. Latham as a *circulating order*. Group (3) likewise consists of a vowel and four consonants of one character (liquids); but in this case the order of the vocal organs is not observed—at least in the form in which the Hebrew A. is known to us; in order to be symmetrical with the other groups, the sequence would require to be *m, l, n*.

The nucleus of the original A. would thus seem to have consisted of 16 letters, grouped in four tetrads or quaternions, on an organic principle of arrangement. This principle is obscured in English and other modern alphabets, by some of the letters having gradually come to represent quite other sounds than their original. There is sufficient evidence, for example, that in the earliest Latin alphabet, from which the English is derived, the third letter, C, had the power of G (in *gun*). There was a subsequent period in the development of that language when the distinction between the sharp and flat palatal sounds seems to have been lost, and when two syllables like *kam* and *gam* would have been both pronounced alike (*kam*). C thus acquired the power of K, and the letter K itself went almost out of use. But about the time of the first Punic war (264–241 B.C.), the distinction between the sharp and the flat sounds revived; and while the original C continued ever after to have the power of K (*Cicero*, for instance, was pronounced *Kikero*), a new character (G) was formed from it, by a very slight alteration, to express the flat sound. Again, the modern H, which has in most cases become a mere evanescent breathing, can be traced back until it becomes a strong guttural, like CH in the Scotch word *loch*. The place of the third consonant in the cycle of aspirates is a complete blank in the alphabets derived from the Latin; because that language being originally destitute of the sound, dropped the sign of it, from the first. The Latins were, in fact, completely destitute of the genuine aspirate sounds; for even the letter F had not the sound we give it. Therefore, when they had to represent the aspirate consonants of the Greek language, *φ, χ, θ*, they had recourse to the combinations *ph, ch, th*—a clumsy expedient still followed in modern alphabets derived from the Roman, and constituting one of their most serious defects.—The cycle of the sharps is pretty perfect in the English alphabet, for Q is only a variety of K.

It is easy to conceive a language represented by 16 characters of the nature above described. The most serious deficiency would seem to be the want of *r* and *s*. But the sound of *th* is very nearly allied to that of *s* (witness “*loves* or *loveth*,” also the pronunciation of a person who *lithpeth*), and one character might be made to stand for both, as easily as in English *e* is made to represent two sounds so different as those exemplified in *cat* and *city*. Some nations, again, are said to make no distinction between *r* and *l*, so that one character might stand for both these sounds.

But whether or not the Phœnician A. had originally only 16 letters, it is evident that when transplanted into Greece, it had 21 letters, if not 22. In accommodating itself to the necessities of the Greek tongue, it gradually underwent a series of changes. Some of the letters were modified: *He* became *e*; *Cheth, ee*; *Sigma* became *ξ = x*, and the name *Sigma* was transferred to *San*. Other letters were altogether dropped, as *Digamma* (= *v*) and *Koppa*. On the other hand, for such simple sounds as had no representatives in the Phœnician, new characters were invented, and annexed to the end (*v, φ, χ, ψ, ω*).

Another important change was in the *direction* of the writing. In the Phœnician and other Semitic languages, the writing proceeded from right to left. The Greeks, on borrowing the Phœnician A., also wrote for some time from right to left. The mode called *boustrophedon* (turning like an ox in plowing), of writing alternately from right to left and from left to right, was then introduced; and finally the direction from left to right prevailed throughout the west, to the exclusion of the other modes.

In the classical period of the Greek language, the A. had come to consist of 24 letters, as in columns 2, 3, 4 of the following table. Column 1 (copied from Ballhorn's *Alphabet*) gives some of the earlier forms of the Greek letters, found on coins and other inscriptions, of the period when writing still proceeded from right to left; column 2 is from the Alexandrian Codex (q.v.), as given in Key's *Alphabet*; and Nos. 3 and 4 are the modern printed forms of capitals and small letters. The small characters are merely cursive forms or variations of the capitals; and it would not be difficult to show how, in each case, the endeavor to trace the capital on soft material rapidly and without lifting the hand, would give rise to the form now used as the small letter.

With regard to the *figures* or shapes of the letters, it is believed that they all arose out of pictures or hieroglyphic characters. The names of the Hebrew letters are also the names of material objects; and the letters themselves were at first, in all probability, rude outlines of the objects. Aleph, for example, means an “ox,” and the letter was in its origin an outline of an ox's head. The history of Gimel, which means “camel,”

is probably similar. The Hebrew characters known to us are believed to be comparatively modern, and much corrupted from their original forms, and the likenesses are more difficult to trace in them than in the Samaritan and the early Greek, or even in the Latin. Mem, again, is the Hebrew word for "water," and some of the earliest forms of the letter M are zigzag lines, similar to the sign of *Aquarius* (♒) in the zodiac, intended no doubt to represent the undulations of water. Ayn, the name of the Hebrew letter equivalent to O, also means an "eye," and the picture of an eye would naturally degenerate into a circle, first with a dot in the center (which some ancient O's actually have), and then without a dot.

GREEK ALPHABET.				1	2	3	4	Name.	Power.
Α	α	Alpha	a	Λ	λ	Lambda	l		
Β	β	Beta	b	Μ	μ	My	m		
Γ	γ	Gamma	g	Ν	ν	Ny	n		
Δ	δ	Delta	d	Ξ	ξ	Xi	x		
Ε	ε	Epsilon	e (short)	Ο	ο	Omikron	o (short)		
Ζ	ζ	Zeta	ds	Π	π	Pi	p		
Η	η	Eta	e (long)	Ρ	ρ	Rho	r		
Θ	θ	Theta	th	Σ	σ	Sigma	s		
Ι	ι	Iota	i	Τ	τ	Tau	t		
Κ	κ	Kappa	k	Υ	υ	Ypsilon	u		
				Φ	φ	Phi	f ph		
				Χ	χ	Chi	ch		
				Ψ	ψ	Psi	ps		
				Ω	ω	Omēga	o (long)		

The A. came into Italy not directly from Phœnicia, but from Greece, and that at a time when the Greek A. had undergone some of the changes described above, although not all of them; *v*, *φ*, and *χ* had been added, but not *ψ* and *ω*. Moreover, there must have been distinct and independent importations into more than one part of Italy, and that, probably, from different parts of Greece, or, at all events, at different periods. The Etrurian A. is evidently an earlier importation than the more southerly Latin, as it departs less from the Phœnician. There are even differences in different parts of Etruria itself. The alphabets of Etruria north of the Apennines (for numerous inscriptions recently discovered show that this remarkable race must have extended at one time as far north as the Alpine valleys of Provence, Tyrol, Graubünden, and Styria) differ slightly from the alphabets of the inscriptions in Etruria proper, which are demonstrably taken from the A. of the Greek colony of Caere.

The Latin A., which became that of Rome, and thus of the whole western world, was borrowed from a newer form of the Greek—namely, that imported by the Dorian

Greeks of Cumæ and Sicily. The writing in the oldest Latin inscriptions is never from right to left, as is mostly the case in Etrurian. On the other hand the Kaph and the Koph (K and Q) of the Phœnician, which disappear in Etrurian, are retained in Latin. The Greek A. of Cumæ had not yet received the addition of *ϕ* and *ω*; but it still retained the representative of the Phœnician *Vav*, the Digamma, and also *Koppa*, and thus consisted of 24 letters. The Latin tongue, being destitute of aspirate sounds, dropped the three letters *ϕ*, *ϕ*, *χ*, so that the original Latin A. consisted of 21 letters, the forms of which, as seen on the oldest inscriptions, were as in the following table. See Corssen's *Aussprache, Vocalismus und Betonung der Lateinischen Sprache* (Leip. 1858).

Z was early dropped, and the new letter G (see above) substituted for it; and thus the Latin A. continued to the last to consist of 21 letters, until it was applied to the modern tongues of western Europe. The distinction made between *u* and *v*, and between *i* and *j*, in printing Latin books, is a modern innovation; and no Latin word contains either *y* or *z*. The five additional letters that make up the 26 of the English A., arose from the addition of *z*, and the development of *i* into *j*, and of *u* into *v*, *v*, and *y*.

The Anglo-Saxon A. had two useful letters, which have disappeared from modern English—namely, one for the sound of *th* in *thin*, and one (or rather two) for that of *th* in *thine*. These were derived, in all probability, from the Moso-Gothic A., which (as well as the Russian and other Slavonic alphabets) was founded on the Greek rather than the Latin. The loss of these letters is owing to the influence of the Norman-French, the alphabet of which is exclusively Latin. The forms of the Anglo-Saxon letters are as under

A	a	(A)	N	n
Æ	æ	(Æ)	O	o
B	b		P	p
C	c	(C)	R	r (r)
D	d	(d)	S	s (s)
E	e	(e)	T	t (t)
F	f	(f)	U	u
G	g	(G)	W	w (f p p)
H	h	(h p)	X	x
I	i		Y	y
I	i		þ	ð th (thin)
M	m	(M)	ð	ð th (thine)

"The characters between brackets were written by the Anglo-Saxons, but, being for the most part mere corruptions of the Roman forms, are now seldom printed."—Vernon's *Anglo-Saxon Grammar*.

The peculiarities of the several letters will be noticed in their proper places. For their classification, and the defects and redundancies of the English A., see LETTERS AND ARTICULATE SOUNDS. Other points connected with this subject will be found under BLACK-LETTER, ORTHOGRAPHY, and PHONETIC WRITING.

ALPHA AND OMEGA, the first and last letter of the Greek alphabet, employed to convey the idea of completeness or infinity; used in Rev. xxii. 13, to signify Christ in His immeasurable fullness. In early church symbolism the letters combined with a cross in a monogram represented faith in the divinity of Christ, or in Christianity in general.

ALPHEIUS (now Ruféa, Rufá, or Roñá) is the chief river of Peloponnesus (Morea), rising in the s.e. of Arcadia, and flowing w. through Elis, and past the famous Olympia, into the Ionic sea. This river is one of the most celebrated in ancient song, and is connected with a beautiful and characteristic Greek legend. The nature of the upper course of the A. was calculated to affect strongly the imagination of the Greeks. In its passage through Arcadia, a country consisting of cavernous limestone, and abounding in shut-in basins and valleys, it repeatedly disappears under ground and rises again. After these feats, it was capable of anything—even of flowing under the sea—and the Greek colonists of Sicily thought they recognized it in their new country. Close on the margin of the sea in the island of Ortygia (the site of Syracuse), there was a beautiful and copious fountain; and just where the water of this fountain joined the sea, another strong spring bubbled up under the salt water. This could only be another freak of the A.; and it was popularly believed that the sweepings of the temple of Olympia, after the great festival, when thrown into the river, reappeared in the springs at Ortygia. Strabo asserts as a fact that a cup did so.

This wonderful phenomenon found its explanation, as usual, in a myth, connecting it with the history of the gods. The river-god Alpheus became enamored of the nymph Arethusa while bathing in his stream. To escape him, she prayed to Diana, who changed her into a fountain, and opened up an underground passage for her to Ortygia. The river still pursued the object of his love, passing from Greece to Sicily below the sea, without mingling his waters with it, and appearing in the spring that bubbles up by the shore.

**ALPINE**, a co. in e. California, on the Nevada border; drained by the Carson and forks of the Stanislaus and Mokelumne; 1000 sq.m.; pop. '80, 539. It is mountainous, being in the Sierra Nevada range; is rich in silver; and cattle, wool, and grain are produced. Co. seat, Silver Mountain.

**ALPINE CLUB**, an English society to promote mountain explorations, formed in 1858. Three members, Lord Francis Douglas, Mr. Hudson, and Mr. Haddo, lost their lives while descending the Matterhorn in July, 1865. There are similar clubs in other countries, and one was organized in New York in 1873.

**ALPINE HUSBANDRY.** The characteristic feature of A. farming is, that the preparation of fodder is the chief object, and the cultivation of grain only secondary. In the less elevated regions bordering on the flat country, it is the practice to break up the grass from time to time, and take a succession of grain crops. In more elevated districts, the moisture of the climate and the shortness of the season of vegetation, prevent crops requiring tillage from coming to perfection, and there the whole attention is devoted to pasturage and the preparation of meadow-hay. The top-dressing of the plots devoted to hay-growing, with the solid and liquid manure of the cattle, the cutting and making of the hay, and transporting it to the farm-offices, occupy a great part of the labor of the population of the Alps. They turn to account for hay-making those shelves and crevices among the mountains which are inaccessible to cattle, and even goats; the herbage, which often grows luxuriantly in such situations, is cut, bound up in cloths or nets, and carried down difficult paths on the head, or is flung over the precipices.

The grass-lands in the lower regions near the dwellings being mostly reserved for hay, the cattle are pastured in summer in those regions that lie too high or too remote to be inhabited in winter. These pastures consist of plateaus and slopes, which immediately on the disappearance of the snow, become clothed with a rich carpet of herbage and flowers. Each separate locality or pasture is called an *alp*. Some of these "alps" belong to individuals; others to the commune or parish. The more rocky and steep places are pastured by sheep and goats. There are three zones or stages in the A. pastures. The cattle are driven to the first and lowest stage about the end of May; about a month later, they ascend to the "middle Alps;" and by the end of July, they reach the upper Alps. As the days shorten, they descend in the same gradual way, so that the whole "Alp-time" lasts about 20 weeks. The pastures are provided with huts for those who have charge of the cattle, who also convert the milk into cheese. Little butter is made. The departure for the "Alps" in spring, and the return in autumn, are made the occasion of popular festivals.

**ALPINE PLANTS.** This appellation is given not only to those plants which are found at elevations approaching the limit of perpetual snow in the Alps of central Europe, but also to plants belonging to other mountainous regions in any part of the world, whose natural place of growth is near snows that are never melted even by the beams of the summer's sun. As the elevation of the snow-line, however, varies very much in different countries, according to the latitude, and also from peculiar local circumstances, the term A. P. is not so much significant of the actual elevation of the habitat, as of the average temperature which prevails there. On the Andes, near the equator, at an elevation of 12,000 to 15,000 ft. above the level of the sea, many kinds of plants are found, of humble growth, resembling in their general appearance those which occur in Germany and Switzerland at an elevation of 6000 ft.; and these, again, either resemble, or are even identical with, the species which in Lapland grow upon hills of very little elevation, or which, in the northern parts of Siberia, are found at the level of the sea. Similar plants occur also in the Himalaya mountains, at elevations varying remarkably within very narrow geographical limits from local causes, which also create great differences in the general dryness or humidity of the atmosphere. The laws of this natural distribution of plants have been in our own day for the first time investigated and elucidated by Humboldt, Wahlenberg, Schouw, Decandolle, and others, and form the most essential part of a branch of science still in its infancy, and much requiring further study, phytogeography, or the science of the geographic distribution of plants. When the A. P. of central Europe are spoken of, those are meant which grow at an average height of 6000 ft., marking what, in the language of phytogeographic science, is called *zone*. This, on its northern limit, the Riesengebirge, or Giants' mountains, falls as low as 4000 ft., and rises, in the southern Alps and Pyrenees, to an elevation of 9000 ft., and sometimes even above it. Although very rich in forms peculiarly its own, this zone contains many plants which are likewise found on much lower hills, and even in the plains. The number of these, however, diminishes as the elevation increases. Hence the small spaces clear of snow in the highest regions possess a very characteristic flora, the plants of which are distinguished by a very low diminutive habit, and an inclination to form a thick turf, frequently, also,

by a covering of woolly hairs, whilst their stems are very often either partly or altogether woody, and their flowers are in proportion remarkably large, of brilliant colors, and in many instances very odoriferous, upon which accounts, they remarkably attract and please the occasional visitors from the plains. In the Alps of central Europe, the eye is at once caught by gentians, saxifrages, rhododendrons, and various species of primrose. With these and other phanerogamous plants, are associated a number of delicate ferns and exceedingly beautiful mosses. The highest mountains in Scotland exhibit a somewhat similar flora, and beautiful plants, both phanerogamous and cryptogamous, are found on them, which never appear in lower situations, as the Alpine speedwell (*Asperula Alpina*), the small Alpine gentian (*Gentiana nivalis*), the rock scorpion grass, or Alpine forget-me-not (*Myosotis Alpestris*), *Azulea procumbens*, *Woodsi* *ilicensis*, and *hyperborea*, etc. Many A. P. are limited to a very small district. Thus, the flora of Switzerland differs considerably from that of Germany, the latter being now known to contain 3400 phanerogamous plants, of which the former contains 2200, and along with them also 123 species which have hitherto been found only in the Swiss Alps.—There are, moreover, particular species of plants which are found only in single localities, as *Hypericum coris*, upon the mountain of Wiggis in the canton of Glarus; *Valeriana carinthiaca*, upon the Küweger Alp, in upper Carinthia, and many others. There are, however, many species which, occurring on the mountains of central Europe, appear also in those of Britain and of Scandinavia at lower altitudes, but are not found in the intervening plains. See SPECIES. DISTRIBUTION OF.—Cryptogamic plants are generally found in Alpine regions in much greater abundance than elsewhere. The transplanting of A. P. into gardens is attended with great difficulties, and is rarely successful. Their great beauty, even when dried, makes them favorites with those plant collectors who have amusement more in view than the mere interests of science. Small herbaria of them are offered for sale everywhere in Switzerland; and in some places, large collections have been prepared and thrown open to the public.

ALPINI, PROSPERO, 1553-1617, a Venetian botanist and physician. He served in the army when young, but left it to study medicine, to which he added a passion for botany. Being made physician to the Venetian consul at Cairo, A. spent three years in Egypt in his favorite study. He anticipated Linnaeus in learning the sexual differences of plants, and one of his papers gave Europe the first notice of the coffee shrub. He filled the botanical chair in the university of Padua for many years. The genus *Alpinia*, order *Zingiberaceae*, is named after him.

ALPINIA. See GALANGALE.

ALPNACH, or ALPNACHT, a Swiss village, in the canton of Unterwalden, at the foot of Mt. Pilatus,  $1\frac{1}{2}$  m. from that part of lake Lucerne called lake A. It is known principally on account of its celebrated "slide." This was a sort of wooden trough by which the felled timber of Mt. Pilatus was conveyed with amazing velocity from a height of 2500 ft. down to the lake. In order to prevent friction, the trough was perpetually lubricated by a slender rill of water. It is no longer used, the wood being now drawn down by horses and oxen. Pop. of A. 1500.

ALPS, the most extensive system of lofty mountains in Europe, raise their giant masses on a basis of 90,000 sq. m., between  $6^{\circ} 40'$  and  $18^{\circ}$  e. long., and extending in some places from the 44th to the 48th parallel of latitude. The word *Alp* or *Alb*, signifying in the Celtic language "white," was the name given to these mountains on account of their tops being perpetually covered with snow. The Alpine system is bounded on the n. by the hilly ground of Switzerland and the upper plain of the Danube; on the e. by the low plains of Hungary; on the s. by the Adriatic sea, the plains of Lombardy, and the gulf of Genoa; and on the w. by the plains of Provence and the valley of the Rhone. A string of lakes encircles both the northern and southern bases of these mountains, the former at an elevation of 1200 to 2000 ft.; the latter, 600 to 700 ft. The varied natural scenery of France, Italy, Germany, and Hungary has a common center of union in this lofty region. Valleys open out in all directions, sending their melted snows on one side into the North sea, on another into the Black sea, and on another into the Mediterranean.

The water-system of the A. may be thus briefly sketched: 1. In the basin of the Rhine there is the Rhine itself, which partly forms the lake of Constance, at the north-eastern extremity of Switzerland, and receives on the left the important tributaries of the Thur and the Aar; the latter of which flows through lakes Brienz and Thun, and is itself augmented by various affluents, the largest of which are the Reuss and the Limmat. 2. In the basin of the Danube there flow from the s. the Iller, Lech, Isar, and the Inn. Still further e., the Danube has for its tributaries the Traun, the Eas, the Raab, the Drave, and the Save, the last three of which have their sources in the extreme eastern A. 3. In the basin of the Po there are numerous streams, which rise in the southern A.; the principal of these are the Dora Baltea, the Sesia, the Ticino from lake Maggiore, the Mincio from lake Garda, and the Adige. 4. In the basin of the Rhone there are the Rhone (flowing through the lake of Geneva), and various Alpine tributaries, the most important of which are the Arve, the Isère, and the Durance. 5. The Var is the principal Ligurian coast-stream; the Piave, and the Tagliamento, the largest of those which fall into the Adriatic from the southern A.

*Divisions.*—In order to give a clear view of the manifold ranges of this mountain-land, a distinction is generally made between the e., the w., and the middle A.; the last of which is again divided into a northern, central, and southern chain; while a natural separation by river-valleys into groups is also made. 1. *West A.*—The principal ranges of these are: 1. The Maritime A., extending from the middle Durance southwards to the Mediterranean, and rising in the Col Roburent to the height of 9,400 ft. 2. The Cottian A., north of these, whose highest summit, monte Viso, is 13,599 ft. 3. The Graian A., forming the boundary between Savoy and Piedmont, and attaining in mont Iséran an elevation of 13,272 ft., and in mont Cenis, an elevation of 11,457 ft. II. *MIDDLE A. Central Chain.*—1. The Pennine A., between the plains of Lombardy and the valley of the Rhone. Highest summits: Mont Blanc, 15,744 ft.; monte Rossa, 15,151 ft.; mont Cervin, 14,836 ft. 2. The Lepontian or Helvetian A., from the depression of the Simplon, along the plateau and masses of St. Gothard (12,000 ft.), to the pass of mont Splügen. 3. The Rhaetian A., between the Inn, the Adda, and the Upper Adige. *North-east Chain.*—1. The Bernese A., between the Rhone and the Aar; highest summits: Finsteraarhorn, 14,026 ft.; Jungfrau, 13,716 ft.; Schreckhorn, 13,597 ft. 2. The A. of the four "Forest Cantons," the Schwytz A., etc. *The Southern Chain.*—1. The Certler A., between the Adda and the Adige; highest summit, Oetterspitz, 12,822 ft. 2. The Trientine A., between the Adige and the Piave; highest summit, La Marmolata, 9802 ft. III. *EAST A.*—The principal chains of these are: 1. The Noric A., between the plains of the Drave and the Danube; highest summit, Gross-Glockner, 12,431 ft. 2. The Carnic A., between the Drave and the Save. 3. The Julian A., between the Save and the Adriatic sea; highest summit, mont Ter glu, 9366 ft.

*Elevation.*—With respect to height, it is a general rule that the A. are lowest where the system is broadest, that is, in the e., and highest where the system is narrowest, that is, towards the w. Making a threefold distinction of crests, summits, and passes, the principal ranges may be characterized as follows: The crest-line: (1) of west A., 6000 to 11,000 ft.; (2) of middle A., 9000 to 13,000 ft.; (3) of east A., 3600 to 9000 ft. The summits: (1) of west A., 9000 to 14,000 ft.; (2) of middle A., 9000 to 15,800 ft.; (3) of east A., 6000 to 12,000 ft. Height of the passes: (1) of west A., 4000 to 8000 ft.; (2) of middle A., 6500 to 11,000 ft.; (3) of east A., 3500 to 6000 ft.

A comprehensive classification leads to a division of the elevations into three regions; 1. The lower range forming the buttresses of the main masses, and reaching a height of 2500 to 6000 ft.; that is, to the extreme limit of the growth of wood. 2. The middle zone lying between the former limit and the snow-line, at the elevation of 8000 to 9000 ft. 3. The high A., rising to 15,744 ft. The middle zone forms the region of mountain-pasturages, where the characteristic Alpine dairy-farming is carried on. These pastures consist of a rich carpet of grass and flowers. This threefold division of heights, however, does not everywhere coincide with the same phenomena of vegetation: the line of perpetual snow descends lower on the n. side, and the boundaries of the zones above described vary accordingly. 1. The line of demarkation between the region of mosses and Alpine plants and that of perpetual snow, is from 8000 to 9000 feet on the northern declivities; but on the southern it approaches 10,000 ft. 2. The highest limit to which wood attains on the n. is about 6000 ft., while on the s. it is nearly 7000 ft. 3. Grain, beech, and oak on the n. disappear at the elevation of 4000 ft.; on the s. they contrive to exist some hundreds of ft. higher. 4. The region of the vine, as well as of maize and chestnuts, extends to an elevation of 1900 ft. on the northern declivity, and on the southern declivity to 2500 ft. The ranges of outlying lower mountains which flank the high central A. on the n., e., and w. are mostly wanting on the s., especially where the middle A. descend into the plains of Lombardy. Thus the A. rise in steep rocky precipices from the level of the flat plains of the Po, whilst they sink more gradually into the plains on the n.; hence their mighty masses closely piled together present an aspect from the s. more grand and awful; from the n. more extended and various.

*Valleys.*—The variety of the valleys as to form and arrangement is not less striking than in the elevations. Most worthy of notice is the characteristic form of the wide longitudinal valleys that lie at the foot of the high central chains. On the e. side they open directly into the plain; on the n. they are connected with the plain through transverse valleys which often end in lakes. The transverse valleys on the s. side are mostly in the shape of steep rocky ravines, forming in some parts long-stretching lakes. Besides the deep-sunk principal valleys, there are extensive series of basin-shaped secondary valleys, which are the scenes of Alpine life, properly so called. Many of the Alpine valleys have names distinct from the rivers flowing through them. Thus, the valley of the Rhone is styled the upper and lower Valais; that of the Adda, the Valte-line; of the Arve, Chamounix.

*Communications—Passes.*—The valleys of the high A. form the natural means of communication. Some are more accessible than others. The entrance into a longitudinal valley is almost always smooth and easy; art has often had to force an entrance into a transverse valley. On many of the high-roads which link the principal with the secondary valleys, it has been found necessary to blow up long ridges of rock, to build terraces, to make stone-bridges and long galleries of rock as a protection against avalanches, as well as to erect places of shelter (*hospices*) from storms. The construction of these roads may be reckoned among the boldest and most skillful works of man. In crossing the A.,

several defiles (usually seven) have to be traversed; for in addition to the pass of the main crest, there are other defiles on both sides at the entrance of the different valleys. In the e., the number of these narrow passes or defiles is considerably increased. The names applied to the Alpine passes vary according to their natural features or the local dialect; as Pass Sattel (saddle), Joch (yoke) Scheideck, Klaus, Col, Chiusa. The traveler, in the course of a day's journey, experiences a succession of climatic changes, which is accompanied with an equal variety in the manners of the people.

No lofty mountains in the world can boast of being so easily crossed as the European A. Hence we can understand how the plains of upper Italy, accessible from the French, German, and Hungarian sides, have been the theater of bloody strife for ages. The passage of the WEST A. is made by five principal roads: 1. The military road, La Corniche, a coast-road at the foot of the A. from Nice to Genoa, parallel to which a railway now runs. 2. The causeway over the Col-di-Tenda, between Nice and Coni, made in 1778; highest point, 5890 ft. 3. The high-road over Mt. Genève, connecting Provence and Dauphiné with Turin; highest point, 6550 ft. 4. The carriage-road made by Napoleon in 1805, over Mt. Cenis, connecting Savoy with Piedmont; highest point, 6770 ft. Near this the chain is pierced by the railway tunnel (see TUNNEL, and CENIS). 5. The pass of the Little St. Bernard, connecting Geneva, Savoy, and Piedmont; highest point, 7190 ft. By this pass Hannibal crossed into Italy. It is not much used now. Besides these great roads, there are many smaller ones branching off from them, which form a pretty close net-work of communication. The passage of the MIDDLE A. is made by eight principal roads: 1. That of the Great St. Bernard, connecting the valley of the Rhone with Piedmont; highest point, 8170 ft. It was crossed by Napoleon in 1800. 2. The magnificent road over the Simplon, constructed by Napoleon, 1801-1806, and connecting the Valais with the confines of Piedmont and Lombardy; highest point, 6570 ft. 3. Between the Great St. Bernard and monte Rosa is the Col of mont Cervin, the loftiest pass in Europe, being nearly 11,200 ft., connecting Piedmont with the Valais. 4. The pass of St. Gothard, connecting Lucerne with Lago Maggiore; highest point, 6800 ft. It is about to be crossed by a railway. 5. The Bernardino pass, made 1819-23, by the Swiss Grisons and Sardinia; highest point, 6800 ft. 6. The Splügen pass, repaired in 1822, connecting the sources of the Rhine with the Adda. This pass was the one used by the Romans in their intercourse with the countries bordering on the Danube and the Rhine, and also by the German armies on their marches into Italy in the middle ages. 7. The Wormser Joch, also called the Orteles pass, or road, opened by Austria in 1824. It is the loftiest carriage-road in Europe, and connects the Tyrol with Lombardy. 8. The Brenner pass, known to the Romans. It also connects the Tyrol with Lombardy; highest point, 4650 ft. It is now crossed by a railway. Besides these great roads, leading s. into Italy, there are two which lead n. from the valley of the Rhone, and cross the Bernese A., over the Grimsel pass, 6500 ft. high, and the Genavi pass, 7490 ft. high. The roads over the EAST A. are much lower and also much more numerous than those in the MIDDLE or WEST A. The principal are: 1. The road from Venice to Salzburg, crossing the Noric A. at an elevation of rather more than 5100 ft. 2. The road over the Carnic A., which divides into three branches—the first leading to Laybach; the second, to the valley of the Isonzo; and the third, to the valley of the Tagliamento. 3. The roads from the Danube at Linz to Laybach.

*Geology.*—The A. offer a rich field for geological investigations, the results of which hitherto may be thus summed up: The highest central mass—the primary A., as they are called—that rises from the plain to the s.w. of Turin, and stretches in a mighty curve to the Neusiedlersee, in Hungary, consists chiefly of the crystalline rocks gneiss and mica-slate, with a much smaller proportion of granite. Inclosed among the central A. appear representatives of the carboniferous and jurassic formations; but so altered and become so crystalline that their age can only be guessed from a few remaining petrefactions, which are accompanied here and there by garnets. In the Graian, Pennine, and Rhaetian A. occur great masses of serpentine; in the n. of Piedmont, and in the upper valley of the Adige, quartz-porphry. In the e. there are, on the n. and s. sides of the chief range, vast deposits of clay-slate and grauwacke mixed with transition limestone.

Beginning on the Mediterranean coast, and following in general the direction of the central chains, a belt of sedimentary rocks runs along the w. and n. sides to the neighborhood of Vienna. On the s. side a similar belt runs from lake Maggiore to Agram. The undulating curves and colossal dislocations presented by these regions show that the form of their mountains must have been the result of a mighty force acting northwards and southwards from the central A. In respect of age, these sedimentary or calcareous A. include all the members of the series of formations from magnesian limestone up to the lowest strata of the tertiary group. The south-eastern portion of these calcareous mountains, forming the Julian A., mostly consist of cavernous rocks of the jurassic and chalk groups; and are continued with this character into Dalmatia.

*Minerals.*—Precious stones are found in abundance in the trap and primary mountains, especially in the region of the St. Gothard. The rock-crystal of St. Gothard has a world-wide reputation. Mining and smelting become more and more productive as we advance eastward. Switzerland itself is poor in useful ores. Gold and silver are found in Tyrol, Salzburg, and Carinthia; there are also silver-mines in Styria and Illyria, and one near Grenoble, in France. Copper is found in the French A., in Tyrol, and Styria.

The lead-mines near Villach, in Carinthia, yield yearly about 35,000 cwt. The yield of iron in Switzerland, Savoy, and Salzberg is trifling; Carinthia, on the other hand, produces 260,000 cwt., and Styria 450,000 cwt. Quicksilver is extracted at Idria, in Carniola, to the amount of 1000 to 1500 cwt. The Alpine region is rich in salt, especially at Hall in Tyrol, and Hallein in Salzberg. Coal is found in Switzerland, in Savoy, and in the French A., but in no great quantity; the Austrian A. are, again, richer in this important mineral. The mineral springs, hot and cold, that occur in the region of the A. are innumerable. See AIX, ISCHL, LEUK, BADEN, etc.

*Animals.*—The Alpine mountains present many peculiarities worthy of notice in the animal as well as in the vegetable kingdom (see ALPINE PLANTS). On the sunny heights the number of insects is very great; the butterflies are especially numerous. There are few fishes, although trouts are sometimes caught in ponds even 6000 ft. above the level of the sea. Although the lofty mountains are inhabited by eagles, hawks, and various species of owls, yet the birds are few in comparison with the numbers in the plains, and those few are mostly confined to the larger valleys. Among the quadrupeds, the wild goat is sometimes, though rarely, to be met with; the chamois is more frequently seen, chiefly in the eastern districts. The marmot inhabits the upper Alpine regions. Wolves are seen more frequently in the w. than in the e.; in the latter, on the other hand, bears, lynxes, and wild-cats are found, although constantly diminishing in number. Of the domestic animals, goats and oxen are scattered everywhere in large herds. There are fewer sheep than horses, and these are not of good breeds. Mules and asses are used more frequently in the s. than in the n., especially as beasts of burden. Swine and dogs are not common; the latter are used almost solely by the herdsmen, or are kept in the hospices; to assist in searching for the unfortunate wanderers who may be lost in the snow.

The Alpine mountains are rich in singularly beautiful natural scenery, of which the inhabitants of flat countries can scarcely form an idea. Nature in the A. has an infinite variety of aspects. Here the hardened masses of the icy glacier cover the naked rock, avalanches are hurled into immeasurable abysses, the fall of rocks or mountain-slips overwhelm the dwellings, and cover the fields in the valleys; and in the e., the *bora*, with its hurricane strength, hurls before it the upraised masses of snow. There the sun glances upon the scattered silver threads of a water-fall, or mirrors himself in the peaceful waters of a glassy lake, while his rising and his setting are announced to the expectant traveler by the ruddy glow on the snowy mountain-tops. The inhabitant of the A., surrounded on every side by mountains, is unconsciously subdued by their presence, and receives from them a peculiar stamp of character; their dangers fascinate him as well as their charms. The most ceaseless variety of occupation demands all his time and his thoughts; in the mountains he acknowledges his only despots, who seize his soul, and lead it unresistingly. In his constant struggle with the elements, the Alpine dweller strengthens both his mind and body; he opens his heart to the impressions of nature; he gives utterance to his childlike gladness in simple songs, and at the same time defends with self-sacrificing devotion his mountain-fortresses against foreign aggression. But the manners and spirit of the neighboring plains have penetrated into the larger valleys along with the dust of the highway. There the true Alpine life has more and more passed away. The simplicity and characteristic industry of the Alpine farms are now preserved only in the higher secondary valleys.

Six states share the A. The western portion is shared by France and Italy. Switzerland claims the middle A. almost exclusively for her own. Bavaria has only a small share. Austria has the largest share of the A.—in the provinces of Tyrol, Illyria, Styria, and the archduchy. The wide valleys opening to the e. allow the civilization of the plains to enter easily among the mountains. The value of the minerals, and the fertility of the soil, have permitted mining, manufactures, and agriculture to take firm root, and a flourishing trade has caused large towns to usurp the place of mere Alpine villages. In the Tyrol, the pastoral life of the mountains has long been mixed up with the working of mines of salt or other minerals. The inhabitants of whole valleys are occupied in various branches of industry to a greater extent than in any other district of the A., and their sons travel far and near as artisans. See H. and A. Schlagintweit, *Researches into the Physical Geography of the A.* (*Untersuchungen über die die Physikalische Geographie der Alpen*), Leip. 1850.

**ALPUJARAS** (a corruption of an Arabic word which signifies "grass"—an allusion to the splendid pasturage on the n. side), a range of mountains parallel to the Sierra Nevada, and approaching the coast of the Mediterranean sea. Their southern side is precipitous, but the northern slopes away into broad valleys, beyond which rises the Sierra Nevada. They commence in the w. at Motril, where they are separated by the Guadalfeo from the lower Sierra de Holucar, and the adjacent vine-covered hills of Malaga, and stretch as far e. as the river Almeria. The range is divided into two parts by the Adra, each of which bears a particular name. The highest peaks reach an elevation of 7000 ft. On the n. side, owing to the copious rains, there is the richest pasturage, both in the deep valleys and on the uplands. The southern slope, however, is almost destitute of trees or shrubs, with the exception of the fertile valleys near the sea, which are abundantly watered by numerous little streams. Here flourish, under an almost tropical climate, all

the products of the south, even the date-palm and the sugar-cane. The inhabitants are chiefly employed in rearing sheep, and in cultivating the vine and other fruits. A little mining also goes on. Lead, antimony, and silver are got. The Moorish element is still quite discernible in the population of this mountain region.

ALREDUS, or ALRED. See ALURED, *ante*.

**ALSACE**, a German district, forming, along with Lorraine, an imperial territory (Reichsland), reunited (all but the small district of Belfort) to that country in 1871, after two centuries' possession by France. It lies between the Rhine on the e. and the Vosges mountains on the w., extending s. to Switzerland, and n. to Rhenish Bavaria, and occupying 8360 English sq.m. It is exceedingly fertile; rich also in mines and manufactures; and contains the important cities of Strasburg, Colmar, and Mühlhausen. In Cæsar's time, A. was occupied by Celtic tribes; but during the decline of the empire, the Alemanni and other tribes from beyond the Rhine occupied and completely Germanized it. It afterwards formed part of the German empire, under various sovereign dukes and princes, latterly of the house of Hapsburg; till a part of it was ceded to France at the peace of Westphalia, and the rest fell a prey to the aggressions of Louis XIV., who seized Strasburg (1681) by surprise in time of peace. By the peace of Ryswick (1697), the cession of the whole was ratified. Thus—as the Germans used to complain—was this fine land, and one of the noblest branches of the race alienated, from the German people, and the command of the German Rhine disgracefully surrendered to the enemy in the time of misfortune, and, more disgraceful still, not demanded back when fortune favored. German never ceased to be the language of the people, and all newspapers were, during the whole period of the French possession, printed in both languages. Pop. of Alsace-Lorraine, '75, 1,529,408.

**ALSACE-LORRAINE** (*ante*) has an area of 5580 sq.m., with a pop. in 1875 of 1,531,804, which is 227 per sq.m. It is administratively divided into three districts: Ober-Elsass, Unter-Elsass, and Lothringen. The area and population are as follows:

District.	Area. sq.m.	Pop. Dec. '71.	Pop. Dec. '75.
Ober-Elsass.....	1,253	458,873	452,642
Unter-Elsass.....	1,844	600,406	597,850
Lothringen.....	2,383	490,459	481,312
Total.....	5,580	1,549,738	1,531,804

The decrease in population for four years was 0.23 per ct. per year. In the five years preceding 1871 it was 0.84 per ct. per year, owing to war and emigration. In 1876 there were but 158 emigrants and only 108 in 1877. The census of 1871 showed 1,234,588 Roman Catholics, 271,198 Protestants, 2863 members of other Christian sects, and 40,938 Jews. About 87 per ct. are of German and 13 per ct. of French origin. The three principal cities are Strassburg, capital of Ober-Elsass, pop. 94,346; Mühlhausen, capital of Unter-Elsass, pop. 58,513; and Metz, pop. 45,673. The constitution of the German empire was introduced Jan. 1, 1874. The administration is under a governor-general, bearing the title of "Oberpräsident," and under him are governors for the three districts. The estimates of receipts and expenditures for 1876 were \$10,507,507; of which \$1,538,030 was for public education and ecclesiastical matters.

**ALSA'TIA**, the popular name of Whitefriars, London, which served early in the 17th c. as a refuge for criminals; but this immunity was abolished by parliament in 1697.

**AL'SEN** (Dan. *Als*), an island in the Baltic, in the Prussian province of Slesvig-Holstein, and extending from the Apenrade to the Flensborg Fiord, is separated from the mainland by the sound of A., in part very narrow but deep. Its greatest length is nearly 20 m.; its greatest breadth about 12; lat. 54° 46' n., long. 9° 52' e. The island, one of the finest in the Baltic, has a picturesque appearance, is very fertile, with rich woods, and numerous lakes abounding in fish. Its fruit-trees are celebrated over all Slesvig. The Gravenstein apple, in particular, forms an important article of commerce. The chief towns are Sonderborg or Südborg (South Town), and Norborg or Nordburg (North Town). The former has an excellent harbor, with a population, '71, of 5475. Close to the harbor are the ruins of an old and famous castle belonging to the Augustenborg family. Here Christian II., of Denmark and Norway, was confined from 1532 to 1549. In the war of 1864, A. was taken by the Prussians from the Danes.

**AL'STED**, JOHANN HEINRICH, 1588-1638; a German Protestant divine and voluminous writer, professor of philosophy and divinity at Weissenburg. His *Encyclopædia*, *Thesaurus Chronologicæ*, and *De Mille Annis*, are well known. The latter was a prophecy that the thousand years, or millennium, during which the saints were to reign on the earth, would commence in 1694.

**AL'STER**, a river in Holstein, is formed by the confluence of three streams, and in the neighborhood of Hamburg, spreads itself out, and forms a lake, called the Great or Outer A., and, within the t., the Inner A. It flows by several canals into the Elbe.

ALSTON, JOHN, d. 1846; a Glasgow merchant who introduced books printed in raised letters for the blind. He published the Bible in such letters, and more than 20 volumes of other works, besides maps and charts.

ALSTRÖMER, or ALSTRÖMER, JONAS, 1685-1761; a Swedish industrial reformer. He was a clerk and a shipbroker in London, and undertook to introduce English industries in his native country, where he established a woolen factory, a sugar refinery, and improvements in farming, in shipbuilding, tanning, etc. His best success was in bringing sheep from England, Angora, and Spain. High honors were given him; he was made a noble, with permission to change his name to Alströmer, and there is a statue of him in the Stockholm exchange.

ALSTRÖMER, or ALSTRÖMER, KLAS, 1736-96; son of Jonas; a botanist, having for his master and friend, Linnaeus, who named in his honor the genus *Alströmeria*. He visited Spain and wrote a work on the breeding of fine-wooled sheep.

*ALSTRÖMERIA* or ALSTRÖMER'S LILY, a genus of plants of the natural order *Amoryllidaceæ* (q.v.), and, according to Lindley, of the tribe *Alströmeriaceæ*, which is distinguished by fibrous—not bulbous—roots, and by having the outer segments of the perianth different in form from the inner. In this genus, the two lower segments are somewhat tubular at the base, the capsules do not gape when ripe, are 3-valved or pulpy within, and the seeds globose. The leaves are twisted, so that what should be the upper surface, becomes the lower. The species are numerous, natives of the warmer parts of America. Many of them have tuberous roots. Some are sufficiently hardy to endure the open air in Britain, and are admired ornaments of our flower-gardens. Some have climbing or twining stems; amongst these is the *salsilla* (*A. salsilla*), a plant of great beauty, with lanceolate leaves, a native of Peru, which is cultivated in the West Indies, and its tubers eaten like those of the potato. In Britain, it requires the stove or a hot-bed. *A. ovata*, also a beautiful plant, with a slender twining stem, and ovate leaves, is cultivated in Chili for its tubers, which are used as food. It has been introduced into Britain, but its cultivation has made little progress. The tubers weigh from 3 to 6 ounces. A kind of arrow-root is also prepared in Chili from the succulent roots of *A. pallida* and other species.

ALT, or ALTEN (Ger. "old"), a prefix to many names in Europe as "alt-dorf," "old village," or "old town."

ALTAI (i.e., gold mountain) is the term vaguely applied to the high range in the e. of Asia, forming the northern border of that vast table-land known by the name of Chinese Tartary, and extending from 80° to 142° e. long. The A. mountains constitute the boundary between the Russian and Chinese empires, or between the long icy lowlands of Siberia, stretching away to the Arctic sea, and the variegated central plateau that lies s. of them. Their general direction is from e. to w. They are divided into many ranges and groups, each having a distinctive name. From the sea of Okhotsk, in the extreme e. of Asia, they extend in a broad and winding mass to the plains of Turkestan, a little to the w. of lake Zaisan, or Zaizang, a distance of more than 3000 m. The breadth of the system is, in some places, not less than 800 to 900 m. From Okhotsk to the Lena, it is called the Aldan chain; it is next separated into three groups by the valleys of the Amur, Yenisei, and Irtysh, the last of which is called the little A., to distinguish it from the spur that strikes off into Chinese Tartary in a south-easterly direction, which is called the great A., a range that in some places towers into the region of perpetual snow, and whose most easterly cliffs abruptly disappear in the dark clouds which overhang the sandy steppes of Gobi. The Russian A., between Semipalatinsk and the sources of the Obi, have been colonized by the Russians, and as they rival the Ural mountains in their mineral wealth, they have already become one of the most important districts of the Russian empire. This chain consists of a broad Alpine range on the north-western edge of Chinese Tartary, and is called the Altai-Bjelki, or Snowy mountains. It reaches in its highest peaks an elevation of nearly 11,000 ft. Little is known of the geology of the Altaian system. Jasper is found in considerable abundance near the summits, red porphyry lower down, and granite still lower. Around lake Baikal there are numerous granitic masses, interspersed with newer igneous formations, but active volcanoes do not appear until the range reaches Kamtchatka. The mines are rich in gold, silver, copper, and lead. The botany of the mountains is as imperfectly known as the geology, but it seems to be worthy of closer attention. N. of the A.-Bjelki lies the broad zone of the A. mineral districts, the inhabitants of which are employed as miners and agricultural laborers, over whom a strict watch is kept. The s.e. is peopled by the Calmucks of the mountains, a Mongolian race. They are heathens, and their government is a patriarchal one. They lead a nomadic life, encamping in summer among the rich pastures on the mountain-terraces, and in winter within the sheltered recesses of the woody glens.

**ALTAI MOUNTAINS.** Since the article ALTAI was originally written, the explorations of Russian surveyors have led to a more definite knowledge of the form and limits of this important range, now described as a separate system, one of the four parallel chains which constitute the skeleton of eastern high Asia, covering the great table-land. The A. forms an alpine girdle, intersected by wide valleys traversed by many streams,

among which are the Tez river, flowing w. to the Ubsa Nor (lake), and the Kobdo, flowing s. to the Tke Aral lake. The general direction of the range is from w. to e., about the parallel of  $50^{\circ}$  n. It extends between the meridians of  $84^{\circ}$  and  $100^{\circ}$  e. On the e. the A. is separated from the Daurian mountain-system by lakes Kosgol and Baikal; on the w. it terminates in the Katunsk mountains, a small isolated group, in which Mt. Beluka rises to 12,790 ft., far above the line of perennial snow, with extensive glaciers on its western flanks. The climate of the A. is not so severe as might be inferred from its position. The winters are frequently mild, and comparatively little snow falls. The mountain slopes are covered with rich grass, and their flanks are in many parts adorned by magnificent cedar forests. Stags, hares, and wolves abound in the lower, and bears in the higher portions of the range. The A. is celebrated for its gold, silver, and lead mines. Barnaul, on the northern slope of the range, is the chief mining town; and the village of Zeminogorski, s. of Barnaul, is in the center of the richest silver mines in the Russian empire. N. of the Ubsa Nor (lake), the Tangu Ula mountains, connected with the A. on the n., rise to upwards of 11,000 ft. They furnish abundance of white marble of an excellent quality.

**ALTAMURA**, a t. of s. Italy, in the province of Bari, and 28 m. s.w. from Bari, at the eastern base of the Apennines. It is a well-built and beautiful t., surrounded with walls, and having a magnificent cathedral. The surrounding country is fertile, produces much oil and wine, and abounds in rich pastures. A. is supposed to occupy the site of the ancient *Lupazia*. Many fine Grecian antiquities have been dug up. Pop. 17,198.

**ALTAR** (Lat. *altare*, from *altus*, high), the place whereon offerings were laid both by Jews and heathens. The first on record is that which Noah built on leaving the ark. The Israelites, after the giving of the Law, were commanded to make one. We find, from the Old Testament (1 Kings iii. 3; 1 Kings xi. 7; and 2 Kings xxiii. 15), that altars were often erected on high places—sometimes, also, on the roofs of houses. Both in the Jewish tabernacle and temple there were two altars, one for sacrifices, and another for incense. For a minute description of these, see Exodus, Leviticus, and Numbers. The Jewish and oriental altars were generally either square, oblong, or approximating to such; those of Greece and Rome, on the other hand, were often round. Sacrifices were offered to the infernal gods, not on altars, but in cavities dug in the ground.

The word has been transferred into the Christian system. For upwards of five centuries, altars in the Christian churches were, for the most part, made of wood; but in 509 A.D., it was decreed by a council held at Ebone, in France, that none should be consecrated with chrism except those built of stone. In the first ages of Christianity, there was only one A. in a church; but, from a very early time, the Latins have used more than one. In the 12th c., the adorning of churches with images and numerous altars was carried to a great extent, and they were embellished with gold, silver, and precious stones. The Greek church use but one A. Altars were frequently placed at the w. end of the ancient churches, instead of the e., but in England almost uniformly in the e. The only perfect A. of the old times in England is the high A. of Arundel church, Sussex. The slab is 12 ft. 6 in. long, by 4 ft. wide, and 2½ in. thick. The support is of solid stone, quite plain, and plastered over. For 300 years after the time of Christ, the word A. was constantly used to describe the table of the Lord; subsequently, "table" and "altar" were used indifferently. In the first prayer-book of king Edward, 1549, the word A. was used in the rubric, and the Lord's supper was still called the Mass; but in 1550, an order was issued for the setting up of tables instead of altars, and in the second prayer-book of 1552, the word *altar* was everywhere replaced by *table*. The table was further ordered to be of wood, and movable. In Mary's reign the altars were re-erected; but in Queen Elizabeth's, some were riotously pulled down, and injunctions were then issued directing that this should not be done, except under the oversight of the curate and at least one churchwarden. It was charged against archbishop Laud that he had converted communion-tables into altars. What he really did was to remove the tables out of the body of the church, and place them "altarwise," i.e., n. and s., at the upper end of the chancels, where the altars formerly stood; and a dog having on one occasion run away with a piece of the consecrated bread, he directed that rails should be erected to prevent such desecrations in future. The old stone altars used frequently to be made in the shape of tombs, and they inclosed relics; this was from the early Christians having often celebrated the eucharist at the tombs of the martyrs, or, as others say, they were thus made with the design of representing Christ's humanity as having been real, and vouched for by the fact of his body lying in the tomb. The Credence Table and Piscina are adjuncts of an A. By the judgment in the Arches court, 1845, in the case of *Faulkner v. Litchfield*, it was decided that altars may not be erected in churches. This case arose out of the erection, by the Cambridge Camden society, of a stone A. in the church of the Holy Sepulchre in that town.

The old English divines, and, indeed, all Protestant ecclesiastical writers of any importance, are unanimous in the opinion that among Christians the word cannot mean what the Jews and heathens expressed by it. The later fathers used various phrases to denote the solemnity which should attach to the communion-table, such as "the mystical and tremendous table," "the mystical table," "the holy table," etc. And they termed it an A., because, *first*, the holy eucharist was regarded as a kind of com-

memorative sacrifice, or, more properly, a consecrated memorial before God of the great sacrifice on Calvary; and, *second*, the prayers of the communicants were held to be in themselves sacrifices or oblations—sacrifices of thanksgiving, as it were. This is the view of those who hold high church opinions, but does not exclude the other view. Again, they termed it a *table* when the eucharist was considered exclusively in the light of a sacrament, to be partaken of by believers as spiritual food. In the former case, the sacrifice was commemorated; in the latter, it was applied; in the former, it expressed more directly the gratitude; in the latter, more directly the faith of the Christian.

**ALT-DORF.** See **ALTORF**, *ante*.

**ALT DORFER**, **ALBRECHT**, painter and engraver, was b. at Altdorf, in Bavaria, 1488, and d. at Ratisbon, 1538. He is said to have been a pupil of Albert Dürer; but this is not certain. He belongs, however, to that religious school of artists of which Dürer was the head. His pictures are also animated by a glowing and romantic spirit of poetry which is delightful to any one who appreciates the conditions of old German life. The landscape is delineated with the same truth and tenderness as the figures; a rich manifold life pervades the scenes, and everything is handled with the utmost delicacy. His master-piece, now in Munich, is "The Victory of Alexander over Darius," a painting which, it is said, affects the beholder like a heroic poem. As an engraver, A. is reckoned among the lesser masters.

**ALTEA**, a seaport t. of Valencia, Spain, in the province of Alicante, and 25 m. n.e. from Alicante. It stands on a rising ground, on the right bank of a small river called the Alga, and at the head of a bay. It has wide streets, but many of them are steep. The inhabitants are mostly engaged in agriculture; some of them are fishers and sailors. Linen fabrics, ropes, and soap are manufactured. Pop. 5502.

**ALTEN**, **KARL AUGUST**, Count of, one of the chief Hanoverian generals in the French and German war, was b. Oct. 20, 1764; entered the army in 1781, and gained distinction at the siege of Valenciennes, and in the decisive engagement at Hondschooten. He was first lieutenant in 1800, but on account of the unhappy capitulation at Lauenburg, found it advisable to leave Hanover, and came to England. Here he was made commander of the first light battalion in the German legion (1803). In 1808, he assisted as general of brigade in covering the retreat of gen. Moore to Corunna, and in the following year commanded the troops stationed in Sussex. In 1811, he took part, under gen. Beresford, in the siege of Badajoz and the battle of Albuera, and in the following year was promoted by the duke of Wellington. In almost all the engagements of the Spanish war of liberation—at Salamanca, Vittoria, the Pyrenees, Nivelle, Nive, Orthez, Toulouse, etc., A. took a prominent part, and had the command of a corps of 30,000 men, stationed near Madrid, in 1812. He fought with great distinction at Quatre-Bras and at Waterloo, where he was severely wounded; his efforts greatly contributed to the decision of the battle. After his return to Hanover he was made minister of war, and in this capacity d., April 20, 1840.

**AL TENA**, a t. of Westphalia, Prussia, in the government of Arnsberg, 40 m. n.e. from Cologne. It stands on the right bank of the Lenne, in a deep and picturesque valley. It has large public works, the machinery of which is moved by water-power, and manufactures great quantities of needles, pins, and other small articles of hardware. There are also stocking manufactories and tanneries. Pop. '75, 7791.

**ALTENBURG**, the capital of the duchy of Saxe-Altenburg, is situated in a fertile country about 24 m. from Leipsic, and contains (1875) 22,263 inhabitants. Standing on an almost perpendicular rock of porphyry, the old castle of A. forms a striking feature in the landscape. Its foundations are probably as old as the 11th century. A. possesses several excellent educational institutions, a museum, and a theater. Brushes, gloves, and cigars are among the chief manufactures carried on in A., and the book trade is considerable. A railway connects it with Leipsic and Bavaria.

**ALTENESSEN**, a t. in Prussia, in the Rhine province; pop. '71, 10,099.

**ALTENGAARD**, or **ALTEN**, a seaport t. in the province of Finmarken, Norway, situated at the mouth of the river Alten, in lat. 69° 55' n., and long. 23° 4' e. Beyond this point no cultivation is attempted; and even here potatoes and barley alone are produced. A. has a harbor and considerable trade. It is visited principally by Russian and Norwegian vessels. Pop. about 1000.

**ALTEN-ÖTTING**, or **ALTÖTTING**, a place of pilgrimage not far from the Inn, is situated in one of the most beautiful and fertile plains of upper Bavaria. It is frequented by thousands of Roman Catholics from Austria, Bavaria, and Swabia, on account of a famous image of the Virgin Mary (the "Black Virgin") which it possesses, and may be called the Loretto of Germany. It has also an extraordinarily rich treasure of gold, silver, and precious stones. From 1838 till their expulsion in 1873, A. was the headquarters for Germany of the redemptionist fathers. There is also a capuchin monastery here. A. was originally a *villa regia*. Several German emperors, such as Henry III. and Henry IV., held their court here. The emperor Leopold I., and other princes of the house of Hapsburg, made pilgrimages to it. A chapel, called Tilly's or Peter's chapel, contains

the tomb of count Tilly, who was buried here at his own request. Maximilian I. and numerous other princes and princesses of the Bavarian family have had their hearts interred in it. Pop. '75, 2629.

**ALTENSTEIN**, a castle near Eisenach, Saxe Meiningen, on the s. slope of the Thuringer wald, the summer residence of the governing dukes. It has a fine park in which is a cavern 500 ft. long through which flows a large stream. Boniface lived and preached here in 724; and near by is the place where, in 1521, Luther was seized to be carried off to Wartburg.

**ALTENSTEIN, KARL VON**, Baron, 1770-1840; a Prussian statesman. After the treaty of Tilsit he became the head of the finance department; in 1815, he went to Paris with Humboldt to claim the restoration of works of art taken from Prussia by the French armies; afterwards he was minister of public worship and education, doing great service for the universities and schools. Under his direction the university of Bonn was founded. He was one of Fichte's warm supporters.

**ALTERATIVES**, in medicine, a term applied to remedies that have the power of changing the state of the living solids of the body, and consequently altering the functions which they perform. It is generally applied, however, to medicines which are irritant in full doses, but which almost imperceptibly alter disordered actions or secretions; acting specially on certain glands, or upon absorption in general, when they are given in comparatively small doses, the treatment being continued for a considerable length of time. For example, mercury is an irritant in some of its preparations; but when small doses of blue pill, Plummer's pill, or corrosive sublimate are given at intervals for some length of time, they "produce *alteration in disordered actions*, so as to cause an improvement in the nutrient and digestive functions, the disappearance of eruptions, and the removal of thickening of the skin or of other tissues" (Royle); and they will effect these changes without otherwise affecting the constitution or inducing salivation. So iodine, also an irritant in concentrated doses, and poisonous in some forms, is most useful, when given in small doses, in effecting the removal of enlarged glandular organs, and need not cause iodism, if carefully given.

The preparations of gold are likewise stimulants of the absorbents, and are used in cases of scrofula. Some preparations of arsenic are powerful A. in cases of skin-disease. So also are the decoctions of the *woods* and their substitutes, such as decoction of sarsaparilla, and the like, which, when taken in large quantities of water, must operate partly by their diluting and solvent properties, and partly by the stimulant effect of the active principles of several ingredients in these diet-drinks, conveyed into the capillaries.

It will be seen, therefore, that the term A. rather implies the method in which some drugs are administered, than any special alterative action possessed by them. The most useful, it may be added, are also the most dangerous in unskilled hands.

**ALTERNATE**, in botany. See **LEAVES**.

**ALTERNATE GENERATION**, a method of reproduction in certain of the lower orders of animal life, in which the young resemble not the parent but the grandparent or some more remote ancestor, the successive generations passing through a regularly recurring series. The radiated creatures, popularly called jelly-fishes, illustrate A. G. In pools left at low tide on the sea-shore, a hydroid is found growing in tufts like shrubs, each individual pendent from the general mass by a slender tube, as a flower from its stem, each mouth taking food for the common nourishment. The young of this creature are jelly fishes, small, transparent cups, from which depend four long threads and a proboscis, each specimen an independent unit moving freely in the water. This creature produces bunches of spheres from which come other jelly-fishes, and also spheres or eggs from which are developed pear-shaped bodies, that take a permanent abode and have the form of the first hydroid. The fixed hydroids and swimming jelly-fishes are alternate forms assumed by the successive generations of the same animal.

**ALTHERA**. See **MARSH MALLOWS** and **HOLLYHOCK**.

**ALTHEN, EKAN, or JEAN**, 1711-74; b. in Persia, and a slave to a planter, from whom he escaped and went to Avignon, where he established the cultivation of madder. Like many others who have conferred great benefits on the public, he died in extreme poverty. The public authorities were setting up a monument to A. at Avignon while his only daughter was dying in a charity institution.

**ALTHORP, LORD**. See **SPENCER, ante**.

**ALTIN'**, a lake in Siberia, which is one of the sources of the Obi, in the Altai mountains, 320 m. s. of Temsk; 80 m. long by 50 wide. This lake is remarkable because in winter the northern part is frozen so as to bear sledges while the southern part has never been known to freeze.

**ALTITUDE**, in astronomy, is the height of a heavenly body above the horizon. It is measured, not by linear distance, but by the angle which a line drawn from the eye to the heavenly body makes with the horizontal line, or by the arc of a vertical circle intercepted between the body and the horizon. Altitudes are taken in observatories by means of a telescope attached to a graduated circle (see **CIRCLE**), which is fixed vertically. The telescope being directed towards the body to be observed, the angle which it makes with

the horizon is read off the graduated circle. The A. thus observed must receive various corrections—the chief being for parallax (q.v.) and refraction (q.v.)—in order to get the true A. At sea, the A. is taken by means of a sextant (q.v.), and then it has further to be corrected for the dip of the visible horizon below the true horizon (see HORIZON). The correct determination of altitudes is of great importance in most of the problems of astronomy and navigation. See LONGITUDE.—An ALTITUDE and AZIMUTH INSTRUMENT consists essentially of a vertical circle with its telescope so arranged as to be capable of being turned round horizontally to any point of the compass. It thus differs from a transit circle (q.v.), which is fixed in the meridian. See AZIMUTH.

ALT'KIRCH, a t. in upper Alsace, 70 m. s. of Strasburg; pop. about 3200; selected by Germany to be fortified as a counterpoise to Belfort in France. A. was founded in the 12th c., and has the ruins of a castle which was often occupied by Austrian archdukes in their visits to Alsace.

AL TO (*contralto deciso*) is the deepest or lowest species of musical voice in boys, in eunuchs, and best of all in females, where its beauty of tone gives it the preference. This quality of the human voice has been too much neglected by modern composers and singing-masters. The powers of expression which it possesses are quite peculiar, and cannot be supplied by any other kind of voice. Its tone-character (*timbre*) is serious, spiritual, tender, and romantic. The low A. in particular has a fullness of tone combined with power in the lower range. No other voice expresses so decidedly dignity, greatness, and religious resignation: it can also represent youthful manly power as well as romantic heroism. The high A. has generally the same range of compass as the mezzo-soprano, but differs from it in the position of the cantabile and in its character of tone. A. voices generally consist of two registers, the lowest beginning at F or G below middle C, and reaching as high as the A or B above the octave C. The higher notes up to the next F or G partake more of the character of the soprano. See VOICE.

ALT-OFEN, a t. of Hungary, on the right bank of the Danube, about 2 m. above Ofen or Buda, of which indeed it may be considered a suburb. The towns are almost united. A. is a decayed place, but of great antiquity, and is believed to occupy the site of a Roman town, *Sicambria* or *Aquincum*. Remains exist of a Roman aqueduct, a bath, and an amphitheater. Attila made this his capital. Pop. '69, 16,002.

ALTON, a t. of Hampshire, England, of considerable antiquity, near the Wey, 16 m. n.e. from Winchester. It is pleasantly situated among picturesque hills and woods. Most of the houses are of brick, but some are of stone. The principal street forms part of the main road from London to Winchester. The church was erected in the reign of Henry VII., and is in the perpendicular style. Its tower, older than the rest of the edifice, has massive Norman arches. A branch railway connects A. with the South-western railway. Bombazines were formerly manufactured here. Good hops are grown in the neighborhood, and there are large breweries in the t., the ale of which is much esteemed. Pop. '71, 4092.

ALTON, a city and port of entry of Illinois, U. S., on the left bank of the Mississippi river, 21 m. above St. Louis, 3 m. above the mouth of the Missouri river, the terminus of the Chicago and Alton railway, and center of a large commerce. The city contains a Roman Catholic cathedral, 10 churches, 1 daily and 3 weekly newspapers, state penitentiary, and numerous mills and manufactories, with an abundant supply of coal and limestone. Pop. '60, 6333; '70, 8665; '80, 8996.

ALTON, JOS. WILHELM EDUARD D', professor of archæology and the history of art at Bonn, was b., 1772, at Aquileia, and d. in 1840. In early years his attention was directed to natural history, especially that of the horse, on which he published a splendid illustrated work (*Naturgeschichte des Pferdes*, Bonn, 1810), which was completed in 1817. In concert with his friend Pander, he projected an extensive work on comparative osteology, of which the first division was published at Bonn, 1821-1828. His engravings of animals, etc., are esteemed as valuable. Albert, the late prince consort of queen Victoria, was a pupil of A. in the history of art.

ALTONA, the largest and richest city in the Prussian province of Slesvig-Holstein, is situated on the Elbe, so near Hamburg that the two cities are only divided by the state boundaries. Pop. '75, 84,218. A. lies higher than Hamburg, and is much healthier; but, on the other hand, it is destitute of the numerous canals so necessary for the transport of goods, with which Hamburg is so abundantly provided. In a commercial point of view, it forms one city with Hamburg. Its trade extends to England, France, the Mediterranean sea, and the West Indies. In 1873, 1073 vessels entered the port. There are many important industrial establishments in A.; among others, the manufacture of tobacco is largely carried on, one factory working up 600,000 lbs. yearly. A. is a free port, and enjoys many privileges in respect of trade, and also of civil freedom; all sects are allowed the free exercise of their religion. The city is connected by a railway with Kiel, Rendsburg, and Glückstadt. The observatory is a private institution, which gained a great reputation under the direction of Schumacher, who died in 1851. The rise of A. to its present importance has been recent and rapid for a continental town.

**ALTOONA**, a city of Pennsylvania, U. S., on the Central Railway, at the eastern base of the Alleghenies, 244 m. w. of Philadelphia; contains 11 churches, 2 banks, 6 hotels, and large locomotive works and machine-shops. Laid out in 1849. Pop. '65, 5500; '80, 19,740.

**ALTORE**, the chief t. in the Swiss canton Uri, is situated in a sheltered spot at the base of the Grunberg, about 2 m. from the head of the lake of the Four Cantons, and contains (1870) 2724 inhabitants. It is a well-built town, having several open places, a church, a nunnery, and the oldest capuchin monastery in Switzerland. The little tower on which the exploits of William Tell are painted in rude frescoes, is known to be older than the legend of Tell. The lime-tree under which the scene of the shooting of the apple was laid, was removed in 1567, and a stone fountain erected in its stead. Situated on the St. Gothard road, A. has some transit trade, but little or no industry of its own.

**ALTO-RELIEVO** (Ital.), high-relief, the term used in sculpture to designate that mode of representing objects by which they are made to project strongly and boldly from the background, without being entirely detached. In A. R., some portions of the figures usually stand quite free, and in this respect it differs not only from *basso-relievo*, or low-relief, but from the intermediate kind of relief known as *mezzo-relievo*, in which the figures are fully rounded, but where there are no detached portions. In order to be in high-relief, objects ought actually to project somewhat more than half their thickness, no conventional means being employed in this style to give them apparent prominence. In bass-relief, on the other hand, the figures are usually flattened; but means are adopted to prevent the projection from appearing to the eye to be less than half; because if an object projects less than half, or, to state it otherwise, be more than half buried in the background, it is obvious that its true outline or profile cannot be represented. This rule, that in all reliefs there shall be either a real or an apparent projection of at least half the thickness of round objects, was strictly observed in the best period of Greek art, but it has been often neglected in the execution of reliefs in later times, and hence attempts have been made at foreshortening and perspective, which have necessarily resulted in partial failure.

Relief forms a kind of intermediate stage between plastic art and painting, the mode of representation being borrowed from the former, whilst the mode of arrangement to a certain extent, is in accordance with the latter. The plastic principle occupies the most prominent place in the simple and tranquil reliefs of the earlier art of Greece, whereas the pictorial principle preponderates in the crowded and often excited scenes represented in the later Roman reliefs. In such reliefs as have been produced in modern times, the one element or the other has prevailed, according as the one model or the other has been followed. The works which have been recovered from the ruins of Persepolis, Nineveh, and Babylon, still attest the extensive employment of relief in Persian and Assyrian art. Of the latter, which usually belongs to the class of *mezzo-relievo*, some of the finest specimens in existence are now to be seen in the British museum. Though never exhibiting the life and freedom of classical or modern European art, the elaborately executed and majestic reliefs of these semi-oriental nations are greatly in advance not only of the whimsical distortions of nature exhibited by the Hindoos, but of the inanimate and motionless representations of the Egyptians.

The earliest Greek reliefs possessed a hard and severe character, somewhat approaching to the art of those earlier nations of which we have just spoken, and were very slightly raised. Of this we have an example in the two lions over the gate at Mycenæ—probably the oldest Greek relief in existence. It was Phidias who gave to relief its true character, and finally brought it to a degree of perfection which it has never since attained. The *alti-relievi* which adorned the metopes of the parthenon at Athens, and the temple of Apollo at Phigalia in Arcadia, now preserved in the British museum, are still not only unsurpassed, but unapproached as examples of the style. In none of these do we see any attempt at perspective, and even foreshortening for the most part is avoided.

Under the Romans, sculpture was employed to an enormous extent in the decoration of tombs and sarcophagi, whole streets of such monuments being constructed, as, for example, on the Appian way. The result of the demand thus created was that sculpture became a manufacture rather than an art, and attempts were made to supply by technical execution and mere mass what had been lost in thought and spirit. Relief was now applied, often by Greek artists resident in Italy, to purposes for which the Greeks, in their own land and in their better times, had rightly conceived it to be unsuited. Behind figures standing nearly free a second rank was introduced, and those numerous examples of a false style, still to be found in every gallery in Europe, were produced, the imitation of which afterwards led to such a lavish expenditure of artistic talent in Italy. The attempt which the Romans had made to invade the province of painting, by means of sculpture, was carried still further by the Florentine artists of the 16th and 17th centuries. Not only were several rows of figures represented in perspective, but even landscape was introduced with a success which, in the hands of such artists as Ghiberti, was positively marvelous. If the highest perfection in the true plastic style of relief was attained by Phidias in the metopes of the parthenon at Athens, a corresponding merit may be claimed as regards the degenerate pictorial style by Ghiberti in the

celebrated bronze doors of the baptistery of San Giovanni at Florence. Even Canova's reliefs partook to far too great an extent of the character of paintings in stone; and to Flaxman, and above all to Thorwaldsen, must be assigned the merit of restoring this style of art to its genuine and original principles. It is to be remembered, in studying the reliefs of classical times, that studiously as the Greeks avoided a pictorial conception of their subject, they did not eschew the use of color where it could be employed to heighten the effect of their reliefs. There is reason to believe that in many excellent examples the background was painted blue, and that the hems of the garments of the figures, and the like, were often colored or gilded.

**ALTRINCHAM**, a market-t. of Cheshire, England, on Bowden downs, 8 m. s.w. from Manchester. It is situated on the Cheshire Midland railway, and near the duke of Bridgewater's canal, which has contributed greatly to its prosperity. It is a very neat and clean t., and on account of the salubrity of the air, is much resorted to by invalids from Manchester. It has manufactures of artificial manures, and an iron-foundry, but a chief employment of its inhabitants is the raising of fruits and vegetables for the market of Manchester. Pop. '61, 6628; '71, 8478.

**ALTURAS**, a co. in s. Idaho, on Snake river; pop. '70, 689. The Rocky mountains are in the n. part. Mining is the principal business.

**ALUM**, a whitish, astringent, saline substance; properly it is a double salt, being composed of sulphate of potash and sulphate of alumina, which, along with a certain proportion of water, crystallize together in octahedrons or in cubes. Its formula is  $\text{KOSO}_3 + \text{Al}_2\text{O}_3 \cdot 3\text{SO}_3 + 24\text{H}_2\text{O}$ . A. is soluble in 18 times its weight of cold water, and in its own weight of hot water. The solution thus obtained has a peculiar astringent taste, and is strongly acid to colored test papers. When heated, the crystals melt in their water of crystallization; and when the water is completely driven off by heat, there is left a spongy white mass, called burnt A. or anhydrous A. A. is much used as a mordant in dyeing. This property it owes to the alumina in it, which has a strong attachment for textile tissues, and also for coloring matters; the alumina thus becomes the means of fixing the color in the cloth. The manufacture of the colors or paints called lakes depends on this property of alumina to attach to itself certain coloring matters. Thus, if a solution of A. is colored with cochineal or madder, and ammonia or carbonate of soda is added, the alumina of the A. is precipitated with the color attached to it, and the liquid is left colorless. Alumina, the basis of pure clay—which is a silicate of alumina—derives its name from being first extracted from A. A. is also used in the preparation of leather from skins, and, in medicine, as a powerful astringent for arresting bleeding and mucous discharges. Its use in the making of bread, to give a white appearance and more pleasing consistence to bread made from indifferent flour, is highly objectionable. A. rarely occurs in nature, except in a few springs and in some extinct volcanoes, where it appears to be formed from the action of sulphurous acid vapors upon felspathic rocks. In this country, it is prepared artificially from A.-shale, obtained from coal-mines at Hurlett and Campsie, near Glasgow; and A.-slate, which occurs at Whitby, in Yorkshire, and there forms precipitous cliffs, extending about 30 m. along the e. coast of England. The A.-slate, shale, or schist, consists mainly of clay (silicate of alumina), iron pyrites (bisulphuret of iron), and coaly or bituminous matter. When the shale is exposed to the air—as it is in the old *coal-wastes* or mines from which the coal has been extracted—the oxygen of the air, assisted by moisture, effects a decided change upon it. The original hard stony substance begins to split up into thin leaves, and becomes studded over and interspersed with crystals. The latter are the result of the oxidation of the sulphur of the pyrites into sulphuric acid, and the iron into oxide of iron, both of which in part combine to form sulphate of iron, whilst the excess of the sulphuric acid unites with the alumina of the clay, and produces sulphate of alumina. When the A.-shale thus weathered is digested in water, there dissolve out the sulphate of alumina ( $\text{Al}_2\text{O}_3 \cdot 3\text{SO}_3$ ) and sulphate of iron ( $\text{FeOSO}_3$ ); this solution is treated with chloride of potassium (KCl), which decomposes the sulphate of iron, forming sulphate of potash ( $\text{KOSO}_3$ ) and chloride of iron ( $\text{FeCl}$ ). When this liquid is evaporated to concentration, and allowed to cool, crystals of A. separate, consisting of sulphate of alumina, sulphate of potash and water, thus,  $\text{KOSO}_3 + \text{Al}_2\text{O}_3 \cdot 3\text{SO}_3 + 24\text{H}_2\text{O}$ , and the chloride of iron is left in the solution or *mother-liquor*. The crystals of A. obtained from the first crystallization are not free from iron, and hence require to be redissolved in water, reconcentrated, and recrystallized. This operation is generally repeated a third time before the A. is obtained pure.—As the preliminary weathering of the shale takes some years to proceed, a more expeditious method is now largely resorted to. The shale is broken in fragments, and piled up over brushwood in long ridges, shaped like hugh potato-pits, and the brushwood being set fire to, the coaly matter of the shale begins to burn, and the whole ridge undergoes the process of roasting; the results of which are the same as that of the weathering operation—namely, the oxidation of the sulphur and iron, and the formation of sulphate of alumina and sulphate of iron. This material is afterwards worked up as previously described. The roasting operation is so much more expeditious than the weathering process, that months suffice for years. The A. made at Tolfa, near Civita Vecchia, is extracted from A.-stone, a mineral containing sulphate of potash and sulphate of alumina, but united in such a form as to render them insoluble. When the mineral is cal-

cined, the sulphates become soluble, and are extracted by lixiviation. The A. thus manufactured is prized, as being free of iron. The potash in A. can be replaced partly or altogether by soda or ammonia; the alumina by oxide of chromium or sesquioxide of manganese; or the sulphuric acid by chromic acid, or peroxide of iron, without altering the form of the crystals. There are thus soda, ammonia, chrome, etc., alums, forming a genus of salts of which common A. is only one of the species. The more important members of the class, expressed in symbols, are:

**ALUM BAGH**, a fort rendered famous, during the battles and sieges arising out of the Indian mutiny in 1857, by the indomitable resolution of its defenders. The A. B. ("garden of the lady Alum, or beauty of the soul") was a domain about 4 m. from the city of Lucknow, near the Cawnpore road. It comprised several buildings, including a palace, a mosque, and an emanbarra or private temple, bounded by a beautiful garden, which was itself in the middle of a park, and the park inclosed by a wall with corner towers. It had belonged to some members of the royal family of Oude; but when the wars of the mutiny had been fairly begun, the A. B. was converted by the rebels into a fort. It was large enough to contain a powerful military force, and might have become a formidable stronghold, if well defended; but it proved powerless against a small British force. In Sept., Outram, Havelock, and Neill crossed the Ganges from Cawnpore, marched rapidly towards Lucknow, and captured the A. B. on the way. About 300 soldiers were left at the place, with four guns, a number of sick, wounded, and 4000 native camp-followers, under col. McIntyre; while the three generals proceeded with the main body of their force to Lucknow. It was intended that McIntyre should soon be relieved or reinforced; but Havelock and Outram, shut up for two months within the residency at Lucknow, could scarcely send even a small note in a quill to the A. B. Not until the close of Nov. did the British, under Sir Colin Campbell, relieve both Lucknow and the A. B. He brought away all the garrison from the former place, but left Sir James Outram, with 3500 men, to hold the A. B. It was at that time the only spot in the whole province of Oude in the hands of the British; and during the whole winter, Sir James had to defend it against the enemy. On the 12th of Jan., 1858, he was attacked by an armed rabble of sepoys and other malcontents, amounting to 30,000 men. These, however, he completely defeated. They attacked him again with 20,000 men on the 21st of Feb., at a time when his small force was weakened by the absence of a detachment employed in escorting a convoy of provisions and stores from Cawnpore; he, however, met them with the same heroic resolution, and effectually repulsed them. In the next following month, Sir Colin Campbell reconquered Lucknow; and the garrison at the A. B. was relieved from its perilous isolation. Although only a domain converted temporarily into a fort, the A. B. must ever occupy a memorable place in military history.

**ALUMINA**, the most abundant of the earths (q.v.), is the oxide of the metal aluminium (q.v.), the formula being  $\text{Al}_2\text{O}_3$ . It occurs in nature abundantly in combination with silica, associated with other bases. The most familiar of its native compounds is felspar, a silicate of A., and potass ( $\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 + \text{KO, SiO}_2$ ). This is one of the constituents of granite, and of several other igneous rocks. Certain varieties of these, by exposure to the atmosphere, become completely disintegrated, passing from the state of hard, solid rock, such as we are accustomed to see in building-granite, into soft, crumbling, earthy masses. It is the felspar which undergoes the change, and it appears to be owing to the action of rain-water charged with carbonic acid, which dissolves the potass and some of the silica of the felspar, leaving the excess of silica and the A. still united. It is not known, however, why certain specimens of granite are rapidly corroded and crumbled down, whilst others have resisted for ages the same causes of decay. By such a process of disintegration as we have described, the clays of our arable soils are produced. Clay consists of silica and A. in a state of chemical combination. It never is pure A., but the quantity of silica united to the latter is variable. When it is pure, clay is quite white, as we see in the porcelain clay of Devonshire and Cornwall, which is derived from colorless felspar. More frequently, clay is red, owing to the presence of oxide of iron; or black, from the diffusion through it of vegetable matter.

From alum, A. is prepared by adding to a solution of the former, water of ammonia, as long as it occasions a precipitate. The A. appears as a voluminous, white, gelatinous substance, consisting of the oxide of the metal combined with water. When A. is precipitated from a solution containing coloring matter, such as logwood, etc., it carries down the color chemically united to the flocculent precipitate; in this way are formed the colored earths, called *lakes* (q.v.). A. in the state of precipitate, after being gently dried, is readily soluble in acids and in alkalies; but if heated to whiteness, it loses the associated water, contracts greatly in bulk, and forms a white, soft powder, not at all gritty, and with difficulty soluble in alkalies and acids. A., as generally prepared, whether hydrated or anhydrous, is insoluble in water, possesses no taste, and does not

alter coloring matters; but some time ago Mr. Walter Crum obtained A. in an allotropic form, in which it is soluble in water. It is quite different, therefore, in properties from the alkaline earths, and is a much weaker base. In the anhydrous state it absorbs water with great readiness without combining with it, so that it adheres to the tongue, and is felt to parch it. Clay retains this property; and the ends of tobacco pipes are glazed to prevent adhesion to the lips or tongue. A. is not fusible by a forge or furnace heat, but it melts before the oxyhydrogen blow-pipe into a clear globule, possessing great hardness. It occurs in nature in a similar state. The more coarsely crystallized specimens form the emery which is used for polishing; the transparent crystals, when of a blue color, owing to a trace of metallic oxide, constitute the precious gem the sapphire, and, when red, the ruby. A., in common with other sesquioxides, is a feeble base. The salts it forms with the acids have almost all a sour taste, and an acid action on coloring matter.

**ALUMINIUM**—sym. Al, eq. (old) 18.7, (new) 27.4—is one of the metals present in clay, granite, and other rocky and earthy substances. It was discovered by Wöhler in 1828, and was re-examined by him in 1846, when he obtained the metal in minute globules or beads, by heating a mixture of chloride of A. and sodium. In 1855, the French chemist Deville showed, as the result of a series of experiments, that A. could be prepared on a large scale and in a compact form without much difficulty. The mineral cryolite found in Greenland, which is a double fluoride of A. and sodium, was the ore first used for its manufacture; but bauxite, a mineral found in France, and consisting chiefly of alumina, or oxide of A. and oxide of iron, has more recently been employed as a convenient source of the metal. An aluminate of soda is first obtained by heating the bauxite with soda ash in a furnace, and separating it (the aluminate) from the insoluble portions by lixiviation. When carbonic acid is added to the solution, pure alumina is thrown down. The alumina is then formed into balls with common salt and charcoal, which are heated in an earthenware retort through which chlorine gas is passed. In this part of the process, the charcoal combines with the oxygen, and the chlorine with the A.; the latter sublimes over with the common salt (chloride of sodium), and is collected as a double chloride of A. and sodium. When this double chloride is heated in a reverberatory furnace with fluxes and metallic sodium, the latter seizes the chlorine combined with the A., which is then set free, and falls to the bottom ready to be cast into ingots for use. A. was made for some years near Newcastle-on-Tyne, by Mr. J. Lothian Bell, but the demand for it not being sufficient to keep the work constantly in operation, it was stopped, and the metal is now chiefly manufactured in France.

The properties of A. are that it is a white metal, somewhat resembling silver, but possessing a bluish hue, which reminds one of zinc. It is very malleable and ductile, in tenacity it approaches iron, and it takes a high polish. When heated in a furnace, it fuses, and can then be cast in molds into ingots. Exposed to dry or moist air, it is unalterable, and does not oxidize as lead and zinc do. Cold water has certainly no action upon it, and in the majority of experiments hot water has not sensibly affected it. Sulphureted hydrogen, the gas which so readily tarnishes the silver in households, forming a black film on the surface, does not act on A., which is found to preserve its appearance under all ordinary circumstances as perfectly as gold does. When fused and cast into molds, it is a soft metal like pure silver, and has a density of 2.56; but when hammered or rolled it becomes as hard as iron, and its density increases to 2.67. It is therefore a very light metal, being lighter than glass, and only one fourth as heavy as silver. This property was taken advantage of by Napoleon III., who ordered the eagles surmounting the standards of the French army to be made of A. instead of silver; and thus the same sized eagle was reduced to one fourth of its former weight. A. is very sonorous; and when a rod or small bell made of it is struck, it gives out a very sweet, clear, ringing sound. A. forms, with copper, several light, very hard, white alloys; also a yellow alloy, which, though much lighter than gold, is very similar to it in color. This gold-like alloy, which contains from 5 to 10 per cent of A., and is of great strength, was discovered by Dr. Percy of London, and has hitherto been much more used for manufacturing purposes than A. alone. It is much used for watch-chains, pencil-cases, and other ornamental articles. By itself, A. is used for jewelry, small statuettes, and other works of art. It is also employed for the tubes of opera-glasses. Its bluish color can be whitened by hydro-fluoric and phosphoric acids, and also by a heated solution of potash. On the whole, considering its valuable properties, this metal has not received such extensive application in the arts as might have been expected.

**ALUMNUS**, originally indicating a student supported and educated at the expense of the "Alumnat," an institution endowed for educating youths who could not pay for living and tuition. Three such, founded by Maurice of Saxony, are still in active operation. But in modern usage every graduate of a college is an A. In law, *alumnat* is a term for the general responsibility in the eyes of the law attached to the relationship of foster father towards the child whom he has undertaken to support and educate.

**ALUM ROOT.** This name is given in the United States to two plants, natives of that country, very different from one another, but agreeing in the remarkable astringency of their roots, which are medicinally used. One of these plants is *geranium maculatum* (see GERANIUM), a plant of general habit and appearance very much resembling some of

the species of geranium which are common weeds in Britain. The root contains more tannin than kino (q.v.) does. The tincture is of use in sore throat and ulcerations of the mouth, and is also administered in various diseases.—The property of astringency belongs, in an inferior degree, to some other species of *geranium*, and of the kindred genera, *erodium* and *pelargonium*.—The other American plant to which the name A. R. is given is *heuchera Americana*, a plant of the natural order *saxifragaceæ* (q.v.), an order in which also astringency is a prevalent property. The genus *heuchera* has the calyx 5-cleft, the petals undivided, five stamens, and the styles remarkably long. *H. Americana* is everywhere covered with a clammy down: the leaves are roundish, lobed, and toothed; the peduncles, dichotomous and straggling. The root is a powerful styptic, and is used to form a wash for wounds and obstinate ulcers.

**ALUN'NO**, **NICCOLO**, or **Niccolo** of Fuligno, one of the old Umbrian painters, whose works first indicated the qualities discernible in that school. His earliest known piece is a "Madonna with Angels and Saints," 1458 A.D. There is also a gonfalon—a banner used in religious processions—of the year 1466, in the church of Santa Maria Nuova at Perugia, which A. painted for the brotherhood, as the inscription testifies: "*Societas Annunciamiento fecit fieri hoc opus.*" It is a work of peculiar beauty, displaying deep religious feeling and exquisite sweetness. A. painted several of these gonfalons. Some of his pictures were carried off by the French, and sent to Paris: but at the restoration of artistic spoil, "The Nativity," "The Resurrection," etc., were returned, although "The Agony in the Garden" still remains in the Louvre. There is also a "Madonna between Two Angels," of the year 1499, to be seen in the parish church of the village of Bastia. Fragments, too, are still in existence of an altar-piece for the cathedral of Assisi. The picture represented a pieta, with two angels bearing torches, and, according to Vasari, weeping so naturally, that "no one," he thinks, "could have painted them better." A. is not so remarkable for the originality or fertility of his invention, as for his selection of details, warmth of feeling, purity, and devout faith. His earnestness, however, leads him at times into exaggeration.

**ALURED**, or **ALRED**, of Beverley, in Yorkshire, an old English historian of the time of Henry I. Little is known regarding him; but he is said to have been educated at Cambridge, and to have greatly distinguished himself by the variety of his learning. It is also stated that he had enriched his mind by travel, both in France and Italy, and that at Rome he became domestic chaplain to cardinal Othoboni. His permanent office, however, appears to have been that of canon and treasurer of the church of St. John in his native town of Beverley, where he wrote his *Annals*. This work commences with a fabulous period of British history, and extends down to the 29th year of Henry I. It was published at Oxford in 1716 by Thomas Hearne, and is a remarkable production, for various reasons. Its Latin is extremely good, and even elegant, while its accuracy, especially in dates, is unusual for the age in which its author lived. He is said, though it is very doubtful, to have written, besides the *Annals*, a work on the liberties or privileges of the church of St. John, of Beverley. The work, whoever wrote it, is a translation of old Saxon documents, charters, etc., relative to that edifice, and is still in manuscript. A. d. in 1128 or 1129.

**ALUTA**, or **ALT**, or **OLT**, a branch of the Danube rising in e. Transylvania, crossing the Carpathians, traversing Wallachia, and emptying opposite Nicopolis; about 330 m. long.

**ALVA**, a village of Stirlingshire, Scotland, pleasantly situated on nearly level ground at the mouth of a romantic glen of the Ochil hills, 7 m. n.e. from Stirling. The part of Stirlingshire in which A. is situated is detached from the rest of the county, and inclosed between the counties of Clackmannan and Perth. A. is a place of great industrial activity, having extensive woolen factories. Formerly the prevailing branch of industry was the blanket trade. In later years this has been entirely superseded by the manufacture of shawls. Tweeds have also been introduced. The number of looms employed is about 1100, the steam-looms having been introduced during the summer of 1867. To the e. of the village is a glen, named the Silver glen, where two pits are still to be seen, marking the site of old silver mines. The communion cups still in use in the parish church are made of silver derived from these mines.

Immediately behind the town is Alva glen, noted for its picturesque beauty and magnificent water-fall. About a mile to the w. of the village is Balquharn Glen, also a very romantic spot. Pop. '61, 3147; '71, 4096

• **ALVA**, **DUKE OF**. See **ALBA**.

**ALVARADO**, a t. of Mexico, in the department of Vera Cruz, on the gulf of Mexico, at the mouth of the river Alvarado, 50 m. s.e. from Vera Cruz. The situation, close to a lagoon, is unhealthy. A bar at the mouth of the river prevents the entrance of vessels of more than 12 or 13 ft. draught, but within the bar the harbor is sheltered from every wind. Great part of the t. consists of cane-built cottages, roofed with palm-leaves. The river has a course of not much more than 100 m., but collects the waters of an extensive swampy district. Much rice and cacao are produced in the country around Alvarado. Pop. 6000.

**ALVARADO, PEDRO DE**, a famous companion of Cortes, was b. at Badajoz in Spanish Estremadura, towards the close of the 15th century. In 1517 or 1518, he sailed for the new world, and in the same year was dispatched from Cuba, by Velasquez, the governor of that island, to explore, under the command of Grijalva, the shores of the American continent. The expedition touched at Acozamil (the isle of Swallows), and at various places in Yucatan. Ascending also the rivers Tobasco and Banderos, Grijalva was so enchanted with the beauty of the country, its fine cultivation, and the numerous traces of advanced civilization, that he named it *New Spain*. Now, for the first time, the Spaniards heard of the riches of Montezuma, and of his vast empire. A. was ordered to return to Cuba, and inform Valasquez of the result of the expedition. The sight of the gold which A. brought with him, stimulated the covetousness and ambition of Velasquez, who became greatly incensed against Grijalva, because the latter had not penetrated further into the new region, and on his return to Cuba deprived him of his command. In Feb. 1519, Cortes sailed from Havana, solely for the purpose of conquest, with eleven ships, containing 508 soldiers and 109 seamen. A. commanded one of these ships; but a storm separating the fleet, he arrived at the rendezvous, isle of Swallows, three days earlier than the others. Here the conquest of Mexico was planned by these intrepid adventurers. A. figured in every conspicuous incident; he was, indeed, hardly less distinguished than the sagacious Cortes himself, who knew his worth, and whom he served with unflinching zeal and fidelity. While he held the city of Mexico, during the absence of his chief, he massacred, in the midst of a fête, a great number of Aztec nobles, which act is said to have excited the indignation of Cortes; but, on the other hand, it is asserted that the Mexicans had plotted the destruction of the Spaniards, and that A. had become cognizant of the scheme. In the famous night-retrait of 1st July, 1520, A. commanded the rear-guard. After the conquest of Mexico, he was sent, in 1523, at the head of 300 foot, 160 horse, with 4 pieces of cannon, and a troop of Mexican auxiliaries, to subdue the tribes on the coast of the Pacific in the direction of Guatemala. He was completely successful, receiving everywhere the submission of the native chiefs, while the people brought him presents, in token of the sincerity of their friendship. He now returned to Spain, where the emperor, Charles V., gave him a splendid reception, and appointed him governor of Guatemala. On departing again for the new world, he was accompanied by numerous friends and cavaliers desirous of making their fortune. His adventurous spirit soon launched him into new enterprises. Pizarro and Almagro were prosecuting a brilliant career of conquest in South America. A. resolved not to intrude upon their territories. He considered the province of Quito to be without the limits of these, and so, embarking with a force of 500 soldiers, 227 of whom were cavaliers, he landed at Bahía de los Caraques, near cape San Francisco, whence he penetrated into the heart of the country, crossing the Andes by as bold and hazardous a march as it is possible to conceive. In the plain of Rio Bamba, he was met by some of the troops of Pizarro, headed by Almagro; but instead of disputing by force of arms his right to the possession of the country in which he found himself, he agreed to retire, on receiving an indemnity for his arduous undertaking. He therefore retired to Honduras, and aided the colonists in establishing new settlements, amongst others Gracias-a-Dios and San Juan de Puerto de Caballos. Meanwhile, Pizarro, loaded with wealth, went back to Spain in 1534, and misrepresented the conduct of A. to the emperor; but the latter following, vindicated himself so successfully, that he received the government of Honduras in addition to Guatemala. Again he embarked for the new world, and pursued his course of discovery and conquest; but in an affray with the Indians upon the coast of Michoacan, in 1541, he was accidentally killed by his horse falling upon him and crushing him. In the same year, an inundation, accompanied by a frightful tempest, overthrew the walls of the town of San Jago, when his wife and children all perished.

**ALVAREZ, FRANCISCO**, 1460-1540; a jurist, and almoner to king of Portugal; sent in 1515 as secretary to an embassy to the king of Abyssinia. In 1533, he went to Rome on an embassy to Clement VII. A. published an account of his travels, curious but not trustworthy, as, like most travelers of his time, he was extremely credulous.

**ALVAREZ, DON JOSE**, a Spanish sculptor, was b. Apr. 23, 1768, at Priego, in the province of Cordova. During youth he labored with his father, a stone-mason; and when 20 years old, began to study drawing and sculpture in the academy of Granada. His early essays in sculpture secured for him the patronage of the bishop of Cordova, and in 1794, he was received into the academy of San Fernando, where, in 1799, he gained the first prize in the first class. Subsequently, he gained the second prize for sculpture in the institute of Paris, and in 1804, increased his celebrity by a plaster-model of Gany-mede, which proved that he could rival Canova in gracefulness of style. He now attempted greater works in the more severe style, and prepared a model for a wounded Achilles, which was accidentally broken. Having removed to Rome, he was here employed by Napoleon to design bass-reliefs for the Quirinal palace on monte Cavallo; but, on account of political changes, his works were not allowed to occupy the places for which they had been destined. In Rome, where he lived on terms of friendship with Canova and Thorwaldsen, he executed, among other works, his *Grupo Colosal de Zaragoza*, now in the royal museum of Madrid, representing a scene in the defense of Sara-

gossa. This work alone is sufficient to establish A.'s fame. Clearness of design, dignified simplicity in execution, trueness to nature, and deep sentiment, mark the sculptures of A., who, next to nature and classical antiquity, studied the works of Michael Angelo. He d. in Madrid, Nov. 26, 1827.

ALVAREZ, JUAN, 1790-1870; a Mexican general and statesman. He led the revolt which deposed Santa Anna in 1855, and became president in his place, but resigned the next year. He was one of the most determined opponents of Maximilian and the French invasion.

ALVINCZY, or ALVINZY, JOSEPH, VON, Baron 1735-1810; an Austrian field-marshal, distinguished in the seven years' war at Torgau and Toplitz. He took part in the campaign against the Turks in 1789, but did not take Belgrade. Though oftener losing than winning, he was selected to lead the Austrian army against Bonaparte; but having lost the important battles of Arcola and Rivoli, he was recalled. In 1798, he was made superior commander of Hungary, and reorganized the army. In 1808, A. was made field-marshal.

ALVIS ("all-wise"); in Norse mythology, the dwarf who answers Thor's questions in the lay (song) of Alvis.

ALWUR, or MACHERY, a Rajpoot state of India, under the control of the governor-general's agent for the states of Rajpootana, but having a considerable measure of independence. It lies between n. lat. 27° 14' and 28° 13', and between e. long. 76° 14' and 77° 15'. Its area is about 3000 sq.m.; its pop., '72, 778,596. The capital, Alwur, is a small ill-built town, surrounded by a wretched mud wall, situated at the base of a rocky range of quartz and slate, 1200 ft. above the adjacent country, and at least 2100 feet above the sea, 94 m. w.n.w. from Agra. The palace of the Rao Rajah is a curious square building, having its walls pierced with a great number of small windows, and covered with glaring and grotesque paintings. The revenue of the Rao Rajah is estimated at about £180,000. The military force of the state amounts to about 3000 infantry and 4000 cavalry. The inhabitants, who are called Mewattis, are a rude and savage race. In former times, the Mewattis were a predatory tribe, and from the 13th to the 15th c., carried their raids even to the gates of Delhi.

ALZEY, or ALZEI, an old city in Rhenish Hesse, on the Selz, 18 m. s.w. of Mentz; pop. '67, 5358; tanning and tobacco manufacturing are the chief industries. The t. was founded in Roman days, and had its own lords in the middle ages, the ruins of whose castles are still visible.

ALZOG, JOHANN BAPTIST, 1808-78; a Roman Catholic theologian. He was professor of church history in the university of Freiburg, and wrote a *Hand Book*, which is known in many languages. He was also the author of an *Outline of Patrology*, and in 1869 was a member of the commission on dogma which prepared the work for the vatican council. He was the only member of the commission who opposed the promulgation of the dogma of papal infallibility.

AMADE'US (i.e., Love-God), a common name in the house of Savoy. The first who bore it was count A., eldest son of count Humbert, who lived about the commencement of the 11th century. His successors gradually enlarged their paternal dominions; but the first to make an important figure in history was A.V., who was b. in 1249, succeeded his uncle Filippo in 1285, and d. in 1328. He acquired the dignity of a prince of the empire. He had a brother who resided for a long period in England, and, while there, built the Savoy palace in London.—His son, A. VI., the "green count," b. in 1334, succeeded his father in 1343. He was a sagacious, moderate, and vigorous ruler, won various places from the dauphin of France, became lord-paramount of Piedmont, and, through the favor of the emperor Charles IV., obtained the vice-regency over a great part of upper Italy. His influence among the Italian states was very great. He d. in 1383.—A. VIII., b. in 1383, was at first under the guardianship of his grandmother, a woman of superior talents; but in 1398 he assumed the reins of government himself, and displayed a spirit of moderation, and, at the same time, a love of order which augured well for his people. The zeal with which he aided the policy of the emperor Sigismund secured him the imperial favor, and the elevation of Savoy into a duchy (1416). On the extinction of its native dynasty, in 1418, Piedmont chose him for its ruler, as he was next of kin. But a religious melancholy taking possession of his mind, he (Nov. 7, 1434) laid down his authority, and, along with six of his knights, betook himself to a monastic hermitage which he had caused to be built on the shores of the lake of Geneva. He was elected pope in 1439, when he assumed the name of Felix V.; but he resigned the papal chair in 1443, and d. three years afterwards at Geneva.—A. IX., after governing for four years, handed over his authority to his wife Jolante, on account of ill health; but she used it very imprudently. While he lived, A. was a mere tool in the hands of grasping factions. He died in 1472.—The prince of this name who has most recently come under the notice of the civilized world, was elected king of Spain in Dec., 1870, and abdicated the throne in Feb., 1873.

AMADE'US I., AMADEO FERDINANDO MARIA, b. May 30, 1845; duke of Aosta, king of Spain, second son of Victor Emanuel, king of Italy. He was rear-admiral in the Italian navy, and lieutenant-gen. in the army. He married, May 30, 1867, princess

Marie del Pozzio della Cisterna, daughter of the countess de Merode. They have three children, Emanuel, Victor, and Louis. On the 4th Dec., 1870, A. accepted the crown of Spain, with the sanction of his father and the approval of the great powers. He reached Madrid Jan. 2, 1871, four days after the assassination of gen. Prim. He himself was assailed by assassins in July, 1872, and also troubled with Carlist risings. On the 11th Feb., 1873, he abdicated for himself and heirs, and returned to Italy, the Spanish cortes proclaiming the republic and making Figueras the first president.

**AM'ADIS**, a much-used heroic name in chivalric poetry. At the head of those heroes of romance, stands A. of Gaul, called the lion knight, from the device on his shield, and also Beltenebros, or the darkly beautiful. The other Amadisese that figure in romance are represented as descendants more or less remote of A. of Gaul. He himself was what the Germans called a love-child of the fabulous king Perion of France and of Elisena, a princess of Bretagne. The relationship of several of the other Amadisese to the princes and princesses of Colchis, Trebisonde, Greece, and Cathay, that figure as their parents, is of the same unsanctioned kind. The romance which narrates the adventures of A. of Gaul is both the most ancient and the best of all the A. romances. It even found favor in the sight of Cervantes, who won immortal honor by overthrowing the long usurped dominion of this "evil sect." This one, however, has maintained its reputation even to the present day, not only because it was regarded by him as a literary curiosity, but also from its own merits, as the original production of a creative fancy.

The question which was early raised, and cannot yet be demonstratively settled, as to whether this romance was originally a Portuguese, a Spanish, or a French production, proves at least the absence in it of all national peculiarities, and the entire want of all national traditions connected with it; and hence the want also of a living historical background, which, in the case of all really national legends, is discernible through the purely epic structure. It may be asserted with certainty, both from internal and external evidence, that this romance is the pure subjective creation of the fancy of a single individual; and that it was composed at a time when the genuine epic style of chivalric writing was near its decline, consequently not earlier than 14th century. It is also apparent that this romance must have been originally written in prose, and intended to be read, and not to be recited. Lastly, it is not to be doubted that the author was well acquainted with the earlier legendary poetry, and has imitated it in many things, but has, nevertheless, struck out for himself a perfectly new path, in an opposite direction, which naturally tended to lead his less gifted imitators into a bottomless abyss, and at last brought about the extinction of the whole class. For these chivalric romances—doubtless unintentionally—became by degrees more and more of an ironical cast; and only a genius like Cervantes was wanting in order to complete their extinction, by making the comic element the fundamental tone, and exaggerating the incongruity inherent in such compositions.

The Spanish A. romances consist of fourteen books, of which the first four contain the history of A. of Gaul. Yet, according to the researches of the learned Clemencin, as stated in his *Commentary on Don Quixote* (Madrid, 1833), it can scarcely be doubted that this most ancient part was originally written in the Portuguese language, by the knight Vasco de Lobeira of Oporto, who died in 1403; and that it must have been composed between 1342 and 1367. The original manuscript is said to have been first in the possession of the infant Alfonso of Portugal, the son of John I., the founder of the house of Braganza, who died in 1461; and last, in that of the duke of Aveiro, and to have been destroyed during the earthquake in Lisbon in 1755. At least, these first four books have only been preserved in the Spanish translation which was made by Garcia Ordoñez de Montalvo, about 1460, and was first printed between 1492 and 1505. The same Montalvo added to it the fifth book, *Las Sergas* [ergas, i.e., actions or deeds] *de Esplandian, Hijo de Amadis de Gáula*. He began this book in 1485, but did not complete it till 1492. The books from the 16th to the 14th contain the exploits and adventures of Florisando, by Paez de Ribera; of Lizuarte of Greece, and of Perion of Gaul, by Juan Diaz; of A. of Greece, of Florisel of Nicea, and of Anaxarte, by Feliciano de Silva; of Rogel of Greece, and of Silves de la Selva, by the same; of Lepolemo, and of Leandro the fair, by Pedro de Lujan; and lastly, of Penelva, by an anonymous Portuguese. The French translators and continuators, beginning with Nicolas de Herberay, Sieur des Essarts, who published the first eight books between 1540-48, have increased this series of romance to 24 books. Gilbert Saunier, Sieur de Duverdiere, has written a conclusion, in seven large volumes, to all the adventures begun in the whole series of legends, which he has called *Le Roman des Romans*.

How popular and widely circulated these romances were in their day, may be proved by the many editions of single legends, by the translations of most of them into Italian, English, German, and even into Dutch, and also by the numerous chivalric romances written in imitation of them. As, nevertheless, a change came over the public taste, they almost all fell into oblivion, and indeed justly so, because of their want of intrinsic merit. They were transferred from the temple of the muses to the literary lumber-room, where now at best they only serve to feast the eyes of bibliomaniacs. A. of

Gaul has been deservedly excepted from this fate, and has not only found readers in the present day, but has been in modern times translated, revised, and imitated. The Portuguese Gilviente, and the Spaniard Andrés Rei de Artieda, extracted from it the materials for two Spanish comedies. De Lubert and count Tressan revived this romance in tasteful extracts; and as Bernardo Tasso formerly did in his *Amadigi*, so now Creuzé de Lesser and William Stewart Rose have extracted from it the materials for epic poems: *A. de Gaule*, *Poème faisant suite aux Chevaliers de la Table ronde* (Paris, 1813), and *A. of Gaul*, a poem in three books (London, 1803.) On the other hand, Wieland's *Neuer A.* has nothing in common with the more ancient Amadis, except the title. See Baret, *De l'Amadis de Gaule* (Par., 1873.)

**AMADOR**, a co. in e. California, drained by the branches of the San Joaquín; pop. '70, 9582. Gold, copper, and marble abound; grain, wool, and wine are the chief products. Co. seat, Jackson.

**AMADOU**, a name given to *polyporus ignarius* and *P. fomentarius*, fungi of the tribe or division *hymenomyces*, and formerly included in the genus *boletus*. They grow upon old trees in Britain, and on the continent of Europe. The pileus is completely blended with the hymenium, which is pierced with thin-sided, rather angular, tubular, vertical passages—the whole fungus thus appearing as a leathery or fleshy mass; the under side of which is pierced by deep pores. *P. ignarius* is called hard A., or touchwood. *P. fomentarius* is called soft A., or German tinder. They are used as styptics for stanching slight wounds; and when steel and flint were in general use for striking fire, were much employed as tinder, being prepared for this purpose by boiling in solution of niter. The soft A. is used for making small surgical pads, for which its elasticity peculiarly fits it. *P. fomentarius*, or a very similar species, is found in India, and used there as in Europe. It is also employed by the Laplanders and others for moxa (q.v.). It is sometimes made into razor-strops, and this use is likewise made of *P. betulinus*.—*P. officinalis*, the agaricon of Dioscorides, which grows upon larch-trees in the s. of Europe, is a drastic purgative, now rarely employed. *P. suaveolens*, which grows upon the stems of willows, and is easily recognized by its anise-like smell, was formerly employed in medicine, in cases of consumption, under the name of *fungus salicis*. All these species are very similar in appearance. Another species of the same genus, *P. destructor*, is one of the fungi known by the name of DRY ROT (q.v.).—The remarkably light wood of *hernandia guianensis*, a shrub of the natural order *thymelæacea* (q.v.), is readily kindled by flint and steel, and is used in Guiana as amadou.

**AMAIN**, a peculiar phrase applied by sailors to signify *at once or suddenly*; in such orders or directions as "lower amain," "strike amain," etc.

**AMALARIC**, 501-531; the last Visigoth king of Spain. He married Clotilda, daughter of Clovis, king of the Franks, in 527, and treated her so badly because she would not embrace Arianism that her brother Childebert came against him, and defeated him, A. being killed while in flight.

**AMALEKITES**, one of the most fierce and warlike of the Canaanitish nations. They dwelt "in the land of the south" (Numbers, xiii. 29), that is, in the land s. of Palestine, or between Idumea and Egypt. From the very first, they manifested an uncompromising hostility to the Israelites, whose rear-guard they smote after the passage through the Red sea. In consequence of this, they received no mercy at the hands of the Israelites, when the latter had established themselves in Palestine. Saul (1 Samuel, xv. 2) nearly annihilated them. Twenty years later, David, while dwelling amongst the Philistines, penetrated into their land, and made dreadful slaughter of them. After this, they made a last desperate reprisal, but were overtaken by David in the midst of their drinking and dancing; and "from twilight, even unto the evening of the next day," he smote them, "and there escaped not a man of them, save 400 young men who rode upon camels and fled." The descendants of these were finally extirpated in the days of Hezekiah, king of Judah, by the Simeonites.

**AMALFI**, a seaport on the gulf of Salerno, on the e. coast of southern Italy, contains about 5000 inhabitants; has a very ancient cathedral, and is the seat of a bishop. It is said to have been founded under Constantine the great, and was long a powerful and independent state, having at one time a pop. of 50,000; and about the close of the 11th c., fell under the power of the Normans. The maritime laws of A. (*tabula amalphitana*) once prevailed throughout Italy. The unique manuscript of the pandects (q.v.) was discovered at A.; and Flavio Gioja, the inventor of the compass, and Masaniello, were born there.

**AMALGAM** is the term applied to that class of alloys (q.v.) in which one of the combining metals is mercury. On the nature of the union, it has been observed that "on adding successive small quantities of silver to mercury, a great variety of fluid amalgams are apparently produced; but in reality, the chief, if not the sole compound, is a solid A., which is merely diffused throughout the fluid mass." The fluidity of an A. would thus seem to depend on there being an excess of mercury above what is necessary to form a definite compound. Mercury unites readily with gold and silver at the usual temperature. It has no disposition to unite with iron even when hot. A solid A. of tin is used to silver looking-glasses.

Amalgamation is employed on a small scale in some processes of gilding, the silver

or other metal being overlaid with a film of gold A., and the mercury being then driven off by heat. But its most extensive use is in separating gold, and especially silver, from certain of their ores. The mercury dissolves the particles of the metal, and leaves the earthy particles; it is then easily separated from the gold or silver. This process, discovered in Mexico in 1557 by Bartolomé de Medina, is very extensively used in Mexico at the present time, and has lately been introduced with great success into the Californian and Australian gold-fields. The mode of application is to crush the quartz rock which serves as the matrix in which the small particles of gold are imbedded; place the fragments in a barrel or revolving drum with mercury, and agitate for some time. The mercury attaches all the gold particles to itself; and in the apparatus, when fully agitated, there is found a semi-fluid mass, which is the mercury, appearing half congealed, and containing all the gold. It is only necessary to place this A. in a retort and apply heat, when the mercury sublimes over—and can be re-employed for further amalgamation—and leaves the gold in the body of the retort. This process is the only known method of separating the finer particles of gold from a mass of rock, and is always used by the gold-crushing companies. Indeed, it is now believed that this truly commercial mode of gold-seeking is the only one which, in a few years, will be had recourse to.

Several amalgams may be regarded as definite chemical compounds. Thus, when gold-leaf is placed in mercury, and the A. so produced filtered by being squeezed in a chamois-leather bag, the uncombined mercury oozes through the skin, but a definite A. of 2 of gold and 1 of mercury remains behind in the leather filter. Tin A. is employed in silvering looking-glasses, and is formed by laying a sheet of tin-foil on a table, covering it with mercury, and then placing, by a sliding movement, the sheet of glass over it. This A. contains 3 of mercury and one of tin; glass balls are silvered with an A. of 10 mercury, 1 tin, 1 lead, and 2 bismuth. A silver A. highly crystalline—and from the clusters of crystals somewhat resembling a tree, called *arbor Dianæ*, or tree of Diana—is prepared from 3 parts of the strongest solution of nitrate of silver, 2 parts of solution of proto-nitrate of mercury added to an A. of 7 mercury and 1 silver. In a day or two, the arborescent appearance presents itself, and the crystals contain 65 per cent mercury and 35 silver. The A. used for frictional electric machines is made from 1 tin, 1 zinc, and 3 mercury, to which sand is afterwards added.

**AMALIA**, ANNA, Duchess of Saxe-Weimar, an amiable lady, and generous patron of literature, was b. in 1739, and, during the latter part of the 18th c., was the center of the court of Weimar. Left a widow in the second year of her marriage (1758), her judicious rule, as guardian of her infant son, enabled the country to recover from the effects of the seven years' war; while her efforts were no less effectual in promoting the education of the people. She appointed Wieland tutor to her son, afterwards duke, and attracted to Weimar such men as Herder, Goethe, Knebel, Böttiger, Musæus, Schiller; forming a galaxy of genius such as no single court, perhaps, was ever graced with. How much the fine qualities of head and heart possessed by the duchess herself contributed to this success, was shown by the fact that when she resigned the government into the hands of her son in 1775, she continued to be surrounded by the same society. She has the high distinction of having honored and encouraged the greatest writers that Germany has produced. The battle of Jena is said to have broken her heart; she d. (1807) six months after that event.

**AMALIE**, MARIE, the wife of Louis Philippe, king of the French, was the daughter of king Ferdinand I. (IV.) of the Two Sicilies, and was b. April 26, 1782. When she married Louis Philippe (then duke of Orleans), he was a political exile, without a hope of ever rising to the throne of France. It was a marriage of personal choice on both sides, and was consequently happy. After Louis Philippe's elevation to the throne, the queen avoided interference in political affairs, and devoted her attention to plans of beneficence. In her domestic relations, her conduct was highly exemplary, and won the esteem of all parties; indeed, the only charge ever preferred against her, was her supposed excess of piety. She shared the fortune of her exiled husband, and was very respectfully received in England. Louis Philippe, shortly before his death (at Claremont, 1850), gave expression to the love and esteem with which he regarded his faithful wife. She d. at Claremont in 1866.

**AMALIE**, MARIE FRIEDERIKE, b. Dec. 21, 1818; queen of Greece; daughter of grand duke Paul and half-sister of grand duke Nicholas, of Oldenburg. She married king Otho of Greece, Nov. 22, 1836, and is much beloved for firmness, benevolence, and many other virtues. During the foreign occupation of Athens, in 1856, she acted as regent. In 1861 a Greek student shot at but failed to kill her. After her husband's deposition in 1862 she accompanied him to Bavaria, residing since his death at Bamberg.

**AMALIE**, MARIE FRIEDERIKE AUGUSTE, 1794-1870; a German duchess and dramatist, eldest sister of king John of Saxony. Many of her dramas have been adapted to the French and English stage. They are noted for love of virtue and cheerful humanity. She also wrote operas and sacred music.

**AMALRIC**, ALMAURIC, or AMAURI OF BENA, founder of a school of Pantheists known by his name. He lectured in Paris about 1200 or 1204. His doctrines were condemned by the university; the pope confirmed the condemnation, and ordered A. to

return to Paris and recant, which he did in 1207. He died two years later, and in the same year two of his followers were burnt before the gates of Paris; his own body was also dug up, burned, and the ashes thrown to the winds. His doctrines were formally condemned by the fourth Lateran council in 1215.

AM'ALS, or AMALI, a royal family of the Goths, furnishing all their sovereigns until the separation into Ostro and Visigoths, after which the Ostro kings were A. until the end of the male line in Theodoric the great. The name A. is thought to have meant 'spotless.'

AMALTHÆ'A, the nurse of the infant Jupiter, supposed to have been a goat; with her two young metamorphosed into stars. It is said that Jupiter broke off one of her horns which he endowed with power to fill with whatever the holder wished, and this was the "cornucopia," or horn of plenty.

AMANDE DE TERRE. See CYPRUS.

AMANITA, a genus of fungi, nearly allied to *agaricus*, but bursting from a *volva*. *A. muscaria*, which is pretty common in woods, especially of fir and beech, in Britain, is one of the most dangerous fungi. It is sometimes called FLY AGARIC, being used in Sweden and other countries to kill flies and bugs, for which purpose it is steeped in milk. The pileus or cap is of an orange-red color, with white warts, the gills white, and the stem bulbous. It grows to a considerable size. Notwithstanding its very poisonous nature, it is used by the Kamtchatkadeles to produce intoxication, and it imparts an intoxicating property to the urine of those who swallow it, of which they or others often avail themselves, when abundance of the fungus is not at hand.

AM'ARANTÉ (anc. *Ante Moranam*), a t. of Portugal, in the province of Minho, on the Tamega, a branch of the Douro, 32 m. n.e. from Oporto. The Tamega is crossed by a handsome stone bridge. The t. is well built, but dull and decayed. A church, erected in the 16th c., is an interesting specimen of the flamboyant style. A. was the scene of a fierce conflict between the French and the Portuguese in 1809, when the bridge was defended by the Portuguese for several days, and the French committed great barbarities. Pop. 5500.

AM'ARANTH, *Amaranthus*, a genus of plants of the natural order *amaranthaceæ*. This order contains nearly 300 known species, natives of tropical and temperate countries, but chiefly abounding within the tropics. They are herbs or shrubs, with simple exstipulate leaves, and flowers in heads or spikes; the perianth usually colored, 3 to 5 partite, hypogynous, scarious, persistent, generally surrounded with small bractæ; the stamens hypogynous, either 5, and opposite the segments of the perianth, or some multiple of 5, distinct or united into a tube, sometimes partly abortive; the anthers either 2-celled or 1-celled; the ovary single, superior, 1-celled, with 1 or few ovules, which hang from a free central cord; style single or absent; stigma simple or compound; fruit, a small membranous bag or utricle, or a caryopsis (q. v.), rarely baccate; seeds lense-shaped, externally crustaceous, embryo curved round the circumference; albumen farinaceous.—The genus *amaranthus* has mostly monœcious flowers (although the order is generally hermaphrodite), with two or three stigmas, and a 1-celled, 1-seeded utricle, bursting all round transversely. Some of the species are naturally of singular form, and others assume singular but monstrous forms through cultivation. *A. caudatus* (love-lies-bleeding), *A. cruentus*, *A. hypochondriacus* (prince's feather), and other species, are common annuals in our flower-gardens. The spikes of *A. caudatus* are sometimes several feet in length. The dry red bracts which surround the flower retain their freshness for a long time after being gathered, for which reason the plant has been employed by poets as an emblem of immortality.—The globe *A. (gomphrena) globosa* and the cockscomb (q. v.), well-known tender annuals, belong to the same natural order. The globe A. is much cultivated in Portugal and other Roman Catholic countries for adorning churches in winter. Its flowers, which are of a shining purple, retain their beauty and freshness for several years. No species of the order can be regarded as a true native of Britain, although *amaranthus blitum* is now found in waste places near London and elsewhere. *A. blitum*, *A. oleraceus* (chusan han-tsi), and other species, are used as pot-herbs; but rarely in Britain. Wholesome mucilaginous qualities are very generally found in the leaves throughout the order. The seeds of *amaranthus frumentaceus* (called kiery) and of *A. anardhana* are gathered as corn-crops in India.—Medicinal properties are ascribed to some species of the order, particularly to *gomphrena officinalis* and *macrocephala*, which have a high and probably exaggerated reputation in Brazil as cures for many diseases.

AM'ARAPURA, or UMMERAPOORA, now a city of the past, was, before 1853, the capital of Burmah, and was situated on the left bank of the Irrawaddy, 9 m. n.e. from Ava, in lat. 21° 57', long. 96° 7'. It was founded in 1783, and made the capital of the empire. In 1810, it was totally destroyed by fire, and in 1839 almost totally by an earthquake. In 1852-53, by order of the king, A. was finally deserted, and the capital of the country fixed at Mandalay. The pop. in 1810 was estimated at 170,000. Nothing remains of the old city but some rows of beautiful trees and a few ruined pagodas. In a temple between A. and Mandalay is a famous colossal bronze image of Gautamma (Buddha).

**AM'ARA-SIN'HA**, a celebrated Hindoo grammarian of great antiquity, who wrote a variety of works, only one of which has come down to us, the *Amara-Kosha*, or thesaurus of Amara; sometimes called the *Trikanda*—i.e., the tripartite. Regarding the author's life, little is known, nor is the precise period during which he flourished definitely ascertained. He is generally supposed to have been one of the "nine gems" who adorned the throne of king Vikramaditya I. (56 B.C.). But Mr. Bentley (*Asiatic Researches*) places him as late as the 11th c. A.D., while Mr. Colebrooke assigns the close of the 5th as the most probable. He is known to have been a Buddhist; and it is universally believed that his writings perished during the fierce persecution to which that sect was subjected by the orthodox Brahmins, in the 3d, 4th, and 5th centuries. This tradition harmonizes with the earliest of the three ages in which he is said to have lived.

The *Amara-Kosha* is a Sanscrit vocabulary, divided into 3 books and 18 chapters, and containing in all about 10,000 words. The words are classed according to the nature of the things signified by them. Almost all the grammarians of Hindostan imitate, translate, or comment upon the work of A.

An excellent edition of the *Amara-Kosha*, with notes in English and an index, was published by Colebrooke, 1808 (reprinted 1829); the Sanscrit text at Calcutta in 1813; and in 1839, a French translation.

**AMARI, MICHELE**, an Italian historian and orientalist, was b. at Palermo, July 7, 1806. At the age of 16, he entered a government office; and shortly after—his father being condemned to 30 years' imprisonment for a political crime—the duty of supporting his mother and the other members of the family devolved upon him. His straitened circumstances soured him; and he even meditated becoming a bandit, but was roused from his morbid wretchedness by falling passionately in love with an English lady. Although he did not win her hand, he secured a knowledge of the English language, the first result of which was a translation of Sir Walter Scott's *Marmion*, published at Palermo in 1832. A. soon became a political "suspect;" and although he had conducted himself during the tumult of 1837 with exemplary moderation, he was summarily transferred to a situation in Naples, where he remained four years, and where he pursued with the utmost diligence his historical investigations. In 1842 appeared his *La Guerra del Vespro Siciliano* (The War of the Sicilian Vespers), which has been often republished, and remains the master-piece of its author. Its great merit arises from its having successfully combated the common notion that the terrible massacre so named was the result of a deep and ramified conspiracy on the part of the nobles. A. proves from a letter of Charles of Anjou himself, as well as from numerous other sources, that it was a popular or national outbreak, occasioned by the tyranny of the foreign rulers, that really brought about the deliverance of Sicily. The book was quickly prohibited, and, as a consequence, widely read. It was translated into German by Dr. Schroöder of Hildesheim, and into English by Lord Ellesmere. A. was now ordered to Naples, but fled to France, where he gave himself up to the study of Arabic and modern Greek, and to the preparation of his *History of the Mussulmans in Sicily*. At the revolution of 1848, he returned to Palermo, where he had been appointed professor of public law, but shortly after his arrival was elected vice-president of the committee of war. He was next sent on a diplomatic mission by the provisional government to France and England. In 1849, he published at Paris *La Sicile et les Bourbons*, to show up the pretensions of the Neapolitan sovereign. After the Sicilian insurrection had been quelled, A. took up his residence in Paris, where he devoted himself to literary pursuits till 1860, when he returned to Italy. He was made senator next year, and in 1863-4 was minister of instruction. Other writings of A. are upon the language and history of the Arabs, in the *Revue Archéologique*, the *Journal Asiatique*, etc. He d. 20th Sept., 1870, at Palermo.

**AMARYLLIDÆE**, or **AMARYLLIDACEÆ**, a natural order of monocotyledonous plants, including many species distinguished by the beauty of their flowers. They are herbaceous plants, or when, as in the genera *agave* and *fourcroya*, they form woody stems, they have still the character of gigantic herbaceous plants rather than of shrubs. The greater part are bulbous-rooted. The leaves are sword-shaped, with parallel veins; the flowers have spathaceous bracts. The perianth is regular, 6-cleft, sometimes with a corona. The stamens are 6, arising from the perianth, sometimes cohering by their dilated bases, the anthers bursting inwardly. The ovary is inferior, 3-celled, with 1, 2, or many anatropal ovules; the style is single; the stigma, 3-lobed. The fruit is a 3-celled, 3-valved capsule, or a 1 to 3 seeded berry. The seed is albuminous, with the embryo nearly straight.—There are about 400 known species of this order, natives of tropical, or sub-tropical, and, more sparingly, of temperate regions—particularly abundant at the cape of Good Hope. A few species only are European. Many of them are much-prized ornaments of our gardens and hot-houses. Amongst these are different species of *NARCISSUS* (q.v.), *AMARYLLIS* (q.v.), *CRINUM* (q.v.), *ALSTROEMERIA* (q.v.), *NERINE*, *COBURGIA*, *BRUNSVIGIA*, *PANCRATIUM*, *FOURCROYA*, etc. To this order belong the *SNOWDROP* (q.v.) and *SNOWFLAKE* (q.v.), and it includes also the *AMERICAN ALOE* (*agave*, q.v.).

**AMARYLLIS**, a genus of bulbous-rooted plants of the natural order *amaryllidæe* (q.v.), having a simple 6-partite perianth, and containing a large number of species, natives of the warmer regions of the globe. Many of them have flowers of very great beauty. A species of this genus, *A. formosissima*, was brought to Europe from South America in the

end of the 17th c., and has since been in common cultivation as a garden-flower. Its flowers are of a beautiful red color, exhibiting a play of golden gleams in the sunshine. They are scentless. *A. amabilis*, *A. Josephine*, and *A. ciliata* are amongst the most admired bulbous-rooted plants. *A. Sarniensis* is one of the most hardy species, flowering freely in Guernsey, with a little protection during winter, and commonly called Guernsey lily, although it is supposed to be a native of Japan. By artificial impregnation, a great number of hybrid forms have been produced in this genus.

**AMASIA**, **AMASIEH**, or **AMASIYAH** (anc. *Amasia*), a t. of Asia Minor, the principal t. of the vilayet of Sivas, on the right bank of the Yeshil-Irmak, about 80 m. from the mouth of the river, and 200 m. s.w. from Trebizond. It stands in a deep and narrow valley, and the river flows through a narrow channel, between precipitous rocky banks. The streets are narrow and crooked; the houses mostly of wood, although some are of stone, all covered with tiles. The river is crossed by three stone bridges, and one wooden bridge. One of the stone bridges is supposed to be Roman. The ancient town, the birth-place of Strabo, occupied both banks of the river, and the remains of the acropolis crown a lofty rock on the side of the river opposite to the present town. There are numerous other interesting remains of antiquity, particularly the tombs of the kings of Pontus, whose capital A. was, excavated in the face of a steep rock, and some Saracenic buildings. Water is raised from the river by means of wheels driven by the river itself, for irrigation of the gardens and mulberry plantations. Much silk is produced in and around A.; also wine, cotton, corn, and madder. Silver, copper, and salt mines are wrought in the neighborhood. Silk and salt are the chief articles of export. A. is the seat of an Armenian bishop. Pop. 30,000, of whom about one third are Christians.

**AMA'SIS**, first Pharaoh of the 18th Egyptian dynasty. He reigned 1525-1499 B.C. He led the insurrection against the shepherd kings, captured their stronghold of Avaris, and drove them into Palestine. He then began a long series of Egypto-Asiatic wars which carried the arms of his successors beyond the Euphrates.

**AMA'SIS**, a king of Egypt. Of humble origin, he rose to be general under Apries, the last king of the line of Psammetichus. Being sent to put down an insurrection, he joined the rebels, and was proclaimed king (569 B.C.). He cultivated the friendship of the Greeks, opened up to them the commerce of Egypt, previously confined to Naucratis, married a Greek wife, and took a body-guard of Greeks into pay. Pythagoras and Solon are said to have visited him. For his alliance with Polycrates, and the singular reason for which Herodotus makes him break it off, see **POLYCRATES**. During his reign of 44 years, he greatly promoted the prosperity and adornment of Egypt. Immediately after his death, the country was conquered by Cambyzes of Persia.

**AMAT' DI SAN FILIPPO E SORZO**, **LUGI**, 1796-1878; cardinal bishop of Ostia and Velletri, dean of the sacred college, and vice-chancellor of the Roman Catholic church. He was educated in the ecclesiastical academy of noblemen, and at the age of 23 was appointed prelate. April 29, 1837, he was made archbishop of Nicaea *in partibus*, and sent as nuncio to Naples; afterwards as nuncio to Spain. In 1837, he was made cardinal, and the next year sent as legate to Ravenna, where he became the intimate friend of cardinal Mastai-Feretti (subsequently Pius IX.). Pius intrusted A. with the Bologna legation, but he was sent away by the revolution, joining Pius at Gaeta, and in 1853 received the two most lucrative positions in the papal court, vice-chancellor, and archivist of the apostolic letters, retaining both until his death, and from time to time acquiring other offices.

**AMAT' TI**, 1550-1684; a family of violin makers at Cremona. Andrea and Nicolo A. are said to have been brothers, and the men who first made violins. The instruments made by the family are of small size, exquisite finish, and exact mathematical proportions of parts; their tone is soft and sweet, but lacking in intensity because the violins are so flat. Stradivarius was one of their pupils.

**AMATITLAN'**, a district of Central America, near Guatemala city, embosomed in abrupt mountains of volcanic origin. It produces cochineal. There is a city A. (pop. 6000) and a lake in the district.

**AMATRICE**, a t. of south Italy, in the province of Aquila or Abruzzo Ulteriore II., on the right bank of the Tronto, 21 m. n. by w. from Aquila. It was formerly a place of much greater importance than it is at present. It has five churches. The inhabitants are chiefly employed in agriculture and the manufacture of blankets. Pop. 2242.

**AMAURO'SIS** (Gr. *amauros*, obscure) is a blindness or obscurity of vision caused by disease of the optic nerve, and this cause may be situated either at the origin of the nerve in the brain, in some part of its course, or at its termination in the retina; and of course the degree of blindness will be in proportion to the extent these parts are involved by the disease. See **OPTIC NERVE**. A. may also depend upon causes remote from the organ of vision; the suppression of accustomed discharges from the body may lead to congestion of the vessels of the brain, and cause A.; and it may spring from many very slight causes, if a predisposition to the disease exists. This is occasionally hereditary. Beer mentions several cases in one family; for three successive generations, all the females who had not borne children became blind in middle age; the males showed a tendency to the disease, but did not become blind. A common cause is ex.

posure to bright light or great heat and light, either natural or artificial, occupation upon minute objects, and employment of the eyes during the hours which ought to be devoted to sleep. In many instances, a single imprudent exposure of the eyes to the operation of some such cause, has been sufficient to extinguish the sensibility of the retina; but, in general, it is from long-continued over-excitement of the organs of vision that they begin to fail, and at last become totally unable to continue their office. The heat of the sun, rage, continued stooping, and fevers or other causes, causing congestion, inflammation, or serous effusion in the head, cause A. Some poisonous substances cause A. suddenly, as belladonna, stramonium, and other narcotics given in large doses; and others, applied to the body every day in small quantities, have the same effect, but more slowly. Tobacco may be justly signalized as a poison of this sort, as also mercury and lead.

Exhaustion of the body and depressing mental affections also are causes of A. But we can seldom attribute its occurrence to the influence of any single remote cause, but to a number of circumstances which have been acting for a length of time upon one individual, either consecutively or together.

We recognize the presence of A. by the history of the case and the appearance of the eyes. The latter have generally a vacant, unmeaning stare, dilated pupils, and do not converge towards an object, but appear to be looking steadfastly at something in the distance. The sclerotic or white of the eye is generally altered in color, and crossed by enlarged blood-vessels. The history of the case varies with the patient. Among the first symptoms are difficulty in calculating distances, as in threading a needle or pouring fluid into a glass; and sometimes there is occasional loss of sight in one eye (*amaurosis vaga*), confusion of vision—sometimes a part of the field of vision will be clear, and part obscured. There are also present spectra or *muscae volitantes*, which sometimes are permanent, arising from the existence of insensible patches on the retina. Floating specks are merely coincident with the disease.

A. is treated by depletion in the robust, alteratives and tonics in the feeble, and by those remedies which act upon the nervous system, and counter-irritation by blisters or issues behind the ears, or in the neighborhood. Except in very recent cases, the prospect of recovery is slight.

**AMAU'RY**, or **AMALRIC I.**, 1135-73; count of Joppa. He was made king of Jerusalem in 1162 on the death of Baldwin, his brother. A. was a vain, ambitious, and imprudent ruler, and, warring upon Egypt, was defeated and driven out by Saladin, who continued his Saracenic conquests over Baldwin IV., son and successor of A.

**AMAU'RY**, or **AMALRIC II.** of Lusignan, king of Cyprus and nominally of Jerusalem, reigned 1194-1205. He called the crusaders to help him against the Saracens, but they stopped at Constantinople to assist in cutting up the Byzantine empire. He left Cyprus to his son, Hugo de Lusignan.

**AMAXI'CHI**, the capital of the Ionian island of Santa Maura or Leucadia, is built on the edge of the shallow lagoons that separate the n.e. part of the island from the mainland. The harbor constructed by the Anglo-Ionian government is protected by a mole, at the end of which is a light-house. It is fitted only for small-craft. A. derives its name from the Greek *amaxai*, "cars," which the Venetian garrison employed in bringing down the oil and wine from the inland districts to the point nearest the fort of Santa Maura, where, subsequently, houses began to be erected. The town has a very mean appearance; the buildings are partly of wood, on account of the frequent earthquakes. Slight shocks occur about once a month. Behind A. there is an old olive-wood, extending to the base of the neighboring hills, and checkered with cypresses and gardens. The town is the residence of a Greek archbishop, and has 15 churches. Pop. 5000. A. is now frequently called *Leukas*.

**AMAZI'AH**, ninth king of Judah, son and successor of Joash. He reigned 29 years, 837-808 B.C. In general his reign was good; the principal event was an attempt to reimpose upon the Edomites the yoke of Judah which they had thrown off in Jehoram's days, and for this purpose A. hired an auxiliary force from Israel of 100,000 men for as many talents of silver—the first mention of a hired or mercenary army among the Jews; but a prophet told him to send back the hired soldiers, which he did, not only losing their services and his money, but exasperating the Israelites, who took the act as an insult, and plundered the towns and people of Judah on their homeward march. But A. was victorious over the Edomites, taking the city of Petra, and slaying 20,000 men. It was, however, a fatal victory; for A., finding some idols of Edom among his plunder, worshiped them; and, elated with his success, undertook to subdue the ten tribes of Israel, but was defeated by their king Joash, and carried a prisoner to his own capital, Jerusalem. Joash satisfied himself by breaking down much of the walls of Jerusalem and plundering the city and temple, leaving A. on the throne after taking hostages for his good conduct. A. died fifteen years later at the hands of conspirators.

**AM'AZON**, **MARANON**, or **ORELLANA**, a river which, after traversing nearly the entire breadth of South America, enters the Atlantic between Brazil and Guiana, by a mouth of about 150 m. in width—a mouth which, though it admits the tide for nearly 500 m., is yet so far from meeting our ordinary notion of an estuary that it repels, or at

least overlays, the ocean to a distance of more than 50 leagues. With its various tributaries—the Napo, the Putumayo, the Yapura, and the Rio Negro from the n., and the Huallaga, the Yavari, the Jutay, the Jurua, the Coary, the Purus, the Madeira, the Tapajos, and the Xingo from the s.—the A. drains 2,330,000 sq.m., an area equal to two thirds of Europe, and is estimated to afford an inland navigation of 50,000 m., a line double the circumference of the globe. In every respect, then, the A. may well claim to be the largest of rivers, excepting only that, in volume of contents as distinguished from volume of discharge, the St. Lawrence, with its computed mass of 11,000 cubic m., has been estimated to be equal to all the other bodies of fresh water on the earth's surface, from the A. downwards. With this exception, which—as the St. Lawrence is really a series of lakes—is rather apparent than real, the Amazon stands forth as the king of rivers, whether trunk be compared with trunk, or branches with branches, alike in essential features and in the area of basin. Viewed as one grand system, the A., from its sources, from which the Pacific may be seen within a distance of 60 m., to its embouchure, comprises a course of about 4000 m.; while, gathering its tribute from both sides of the equator along more than 20° of lat., it presents, perhaps, between s. and n., a longer line of natural communication than even between w. and e. Reckoning from the western range of the Andes, the A. is but little better than a mountain-torrent, till it has burst through the gorges of the eastern range of the chain, where it is overhung by peaks that tower thousands of feet above its bed. But, within 300 m. from the Pacific—a journey of about 20 days for loaded mules—the branch called the Huallaga is practicable for steamers, while, after a run of 325 m., the A. is navigable for vessels drawing 5 ft., growing deeper and deeper and more and more available as it rolls its steadily swelling flood towards the ocean. Nor is this the remotest point of clear navigation from the sea, for the Marañon itself is estimated by Herndon to carry the clear navigation about one fifth higher up, amounting in all to 3360 miles. What an idea do these single threads afford of this matchless net-work of inland navigation! But it is not to its own basin alone, vast as that basin is, that the value of the A. is confined. The Rio Tapajos has its navigation separated only by a portage of 18 m. from that of an affluent of the Plata; the Rio Branco, the main tributary of the Rio Negro, has a water-communication which is only two hours distant from that of the Essequibo; while the Rio Negro itself is doubly connected with the Orinoco, receiving from it the navigable Cassiquiare (q.v.), and wanting only a canal over a portage of six hours to complete a still more useful bond of union, whose superior advantages will certainly one day lead to the necessary improvement. In addition to all this, the outlet of this mighty river, besides washing Cayenne, is itself, under nature's guidance, a feeder, as it were, of that highway of nations, the gulf stream. Thus does the A., to say nothing more of its maritime relations, bring its inland navigation, mediately or immediately, to bear, Chili alone excepted, on every country in South America—Venezuela, Ecuador, New Granada, Bolivia, Peru, Brazil, the Guianas, and the several Argentine republics. This is not mere prospect; not only has the basin proper of the A. been more or less frequently traversed, but also the various joints that knit it to other basins have been tested by experience. The grandest and most singular of them all, besides being explored by Humboldt, has been placed beyond a doubt by the denizens of the country. The barge-builders of San Carlos, at the entrance of the Cassiquiare into the Rio Negro, have long sent vessels, not only down the Rio Negro to Pará, on the lower A., but likewise up the Cassiquiare to Angostura, on the lower Orinoco; thus solving, in their own way, the problem which systematic geographers were elsewhere deriding as worse than a fable—as a sheer impossibility. It was not till 1867 that the navigation of the A. was thrown open, but now regular lines of steamers ply between its mouth and Yurimaguas on the Huallaga. The most important exports sent down the A. are india-rubber, cocoa, cotton, nuts, copaiba, palm-fiber, hides, sarsaparilla, farina, tonka beans, annatto, and tobacco. Other productions of the countries watered by the A., countries well fitted to become the garden of the world, are coffee, sugar, maize, rice, indigo, grapes, bananas, cabinet-woods, building-timber, game, fish, and precious metals. Steam-boat navigation began on the A. in 1853. In that year, the Amazon navigation company, a Brazilian commercial association fostered by the government, sent its first steamer from Pará, the maritime emporium of the A., to Nauta, in Peru; and in 1872, the company had a capital of \$2,200,000, and nine steamers, five of which ply exclusively in the A. waters; two below Pará and Loreto in Peru, distance 2100 m.; one on the Peruvian branch of the river, 288 m.; one from Pará to Obidos, 400 m.; one from Santarem to Faro. The Peruvian government has also a line of steamers on its reach of the A., and up the Huallaga.

The wonderful discoveries made by the late professor Agassiz (1865-66) in the *founna* of the waters of the A. have proved what he himself calls 'a true revelation for science.' Their importance will be seen by contrast. The number of species of fish on the whole globe known to Linnæus about a century ago was 300; in 1840, captain Wilkes collected only 600 species in a voyage round the world with three ships, in an expedition lasting four years; but Agassiz saw in five months on the A. alone 1300 species of fish, nearly 1000 of them new, and about 20 new genera. The *Vaca marina*, the largest fish inhabiting fresh waters, and the Acara, which carries its young in its mouth, especially when there is danger, are denizens of the Amazon.—See *Brazil and the Bra-*

*Illians*, by Fletcher and Kidder (London and Boston, 1866); *A Journey in Brazil*, by professor and Mrs. Agassiz (London, 1868); *A Journey across South America*, by Paul Marcoy, a translation of which was published by Messrs. Blackie & Sons, Glasgow, in 1873.

AMAZONAS, a northern department of Peru; 14,129 sq. l<sup>2</sup>; pop. '76, 34,245 white and about 60,000 wandering Indians. It is bisected by the Andes, and watered by the Marañon (Amazon) and branches. The soil is very fertile, producing wheat, corn, rice, sugar cane, tobacco, coffee, cocoa, cotton, indigo, cinchona, and sarsaparilla in great profusion. In the forests are mahogany, cedar, and other valuable woods. Capital, Chachapoyas.

AMAZONAS, or ALTO AMAZONAS, the northernmost province of Brazil; 753,439 sq. m.; pop. '72, 57,610. The limits are not well defined, and the surface is little known, being mostly covered with original forests. The inhabitants are nearly all Indians. Capital, Barra do Rio Negro.

AMAZONS, AMAZONES. According to a very ancient tradition, the A. were a nation of women, who suffered no men to remain among them, but marched to battle under the command of their queen, and formed for a long time a formidable state. They held occasional intercourse with the men of the neighboring states. If boys were born to them, they either sent them to their fathers, or killed them. But they brought up the girls for war, and burned off their right breasts, that they might not be prevented from bending the bow. From this custom they received the name of A.; that is, "breastless." Such is the ordinary tale; the origin of which is perhaps to be accounted for by supposing that vague reports, exaggerated and poetically embellished, had reached the Greeks of the peculiar way in which the women of various Caucasian districts lived, performing military duties which elsewhere devolved on husbands, and also of the numerous examples of female heroism which, travelers inform us, still distinguish the women of that region. In later times, however, the word Amazon has been supposed to have some connection with the Circassian word 'Maza,' signifying the moon, as if the myth of the A. had taken its origin in the worship of the moon, which prevailed on the borders of Asia. Three nations of A. have been mentioned by the ancients. 1. The Asiatic A., from whom the others branched off. These dwelt on the shores of the Black sea, and among the mountains of the Caucasus, especially in the neighborhood of the modern Trebizond, on the river Thermodon (now Termeh). They are said to have at one time subdued the whole of Asia, and to have built Smyrna, Ephesus, Cumæ, and other cities. Their queen, Hippolyte, or, according to others, Antiope, was killed by Hercules, as the ninth of the labors imposed on him by Eurystheus consisted in taking from her the shoulder-belt bestowed on her by Mars. On one of their expeditions the A. came to Attica, in the time of Theseus. They also marched under the command of their queen, Penthesilea, to assist Priam against the Greeks. They even appear upon the scene in the time of Alexander the great, when their queen, Thalestris, paid him a visit, in order to become a mother by the conqueror of Asia. 2. The Scythian A., who, in after-times, married among the neighboring Scythians, and withdrew further into Sarmatia. 3. The African A., who, under the command of their queen, Myrina, subdued the Gorgons and Atlantes, marched through Egypt and Arabia, and founded their capital on the lake Tritonis, but were then annihilated by Hercules. See Stricker, *Die Amazonen in Sage und Geschichte* (Berl. 1873).

AMBÁLÁ, a city in India, capital of the district of A., 30° 24' n., 76° 49' e.; an important station on the Scinde, Punjab, and Delhi railway. It is a large walled town in a level and well cultivated country. The pop. is 50,662, including the English military station near by; pop. of the city, 24,040; of the district, '68, 1,035,488.

AMBASSADOR is a title by which the highest order of diplomatic ministers is distinguished, and the person holding such a high commission may be defined to be an officer sent by one sovereign power to another to treat on affairs of state. In a less restricted sense, writers on public law employ the term to denote every kind of diplomatic minister or agent. The credentials, or letters of credence, of an A. are addressed directly by his own sovereign to the sovereign to whom he is sent, and with whom he has the privilege of personal communication. In the performance of all his diplomatic duties, an A. is understood to represent, not only the affairs, but the dignity and the power of his master; and by the law of nations he has many important rights and privileges, the chief of which is exemption from the control of the municipal laws of the nation wherein he is to exercise his functions, an exemption that is not confined to the A. himself, but is extended to all his suite, including not only the persons employed by him in diplomatic services, but his wife, chaplain, and household generally. But there is a dispute among legal writers whether this exemption extends to *all crimes*, or whether it is limited to such offenses as are *mala prohibita*, as coining, and not to those that are *mala in se*, as murder. The law of England appears to have formerly allowed the exemption in the restricted sense only; and in the year 1654, during the protectorate of Cromwell, the Portuguese A. was tried, convicted, and executed, for an atrocious murder. But now, according to the general practice of this country, as well as that of the rest of Europe, it is considered that the security of an A. in conducting the inter-

course of nations, is of more importance than the punishment of a particular crime, and therefore few examples have happened in modern times where an A. has been punished for any offense. In regard to civil suits, it was at one time held and laid down by Sir Edward Coke, that an A. to the English court was answerable for any contract which was good according to the law of nations. The full exemption of an A. from legal process in civil cases was first recognized by 7 Anne, c. 12, a statute whose history is thus related by Blackstone: "In the reign of Queen Anne, an A. from Peter the great, czar of Muscovy, was actually arrested, and taken out of his coach in London, for a debt of £50, which he had there contracted. Instead of applying to be discharged upon his privilege, he gave bail to the action, and the next day complained to the queen. The persons who were concerned in the arrest were examined before the privy council (of which the lord chief-justice Holt was at the same time sworn a member), and seventeen were committed to prison, most of whom were prosecuted by information in the court of Queen's Bench, at the suit of the attorney-general; and at their trial before the lord chief-justice, were convicted of the facts by the jury; reserving the question of law, how far those facts were criminal, to be afterwards argued before the judges, which question was never determined. In the mean time the czar resented this affront very highly, and demanded that the sheriff of Middlesex, and all others concerned in the arrest, should be punished with instant death. But the queen (to the amazement of that despotic court) directed her secretary to inform him, *that she could inflict no punishment upon any of the meanest of her subjects, unless warranted by the law of the land; and therefore was persuaded that he would not insist upon impossibilities.* To satisfy, however, the clamors of the foreign ministers, who made it a common cause, as well as to appease the wrath of Peter, a bill was brought into parliament, and afterwards passed into a law (the 7th Anne, c. 12), to prevent and punish such outrageous insolence for the future; and with a copy of this act elegantly engrossed and illuminated, accompanied by a letter from the queen, an A. extraordinary was commissioned to appear at Moscow, who declared, *that though her majesty could not inflict such a punishment as was required, because of the defect in that particular of the former established constitutions of her kingdom, yet, with the unanimous consent of the parliament, she had caused a new act to be passed, to serve as a law for the future.* "This humiliating step," says Blackstone, "was accepted as a full satisfaction by the czar; and the offenders, at his request, were discharged from all further prosecution."

But although an A. is not amenable to any tribunal of the country he resides in, he cannot misconduct himself with impunity. He must respect the laws and customs of the country in which he is officially resident; and if he violates or offends these laws and customs, he may be complained of to the court or government which he represents; or if the offense is of a very serious nature, his recall may be demanded, or the sovereign to whom he has given such offense may dismiss him peremptorily, and further require that he be brought to trial in his own country. It hardly need be added that if an A. is guilty of an offense which threatens the safety of the state, he ceases to enjoy the privileges of the exemption in question.

There are some other and inferior privileges which are very generally allowed to ambassadors: they are, for instance, permitted the free exercise of their religion; they are, in general, exempted from direct taxation, they have special letter-bags, and they are usually allowed to import their goods without paying any custom-house duties—a privilege, however, which, being liable to abuse, has sometimes been limited.

Ambassadors are of two kinds—first, those who reside regularly at the court to which they are accredited; and, secondly, those who are sent on special occasions, when they receive the designation of AMBASSADORS EXTRAORDINARY. The employment of permanent ambassadors originated in modern times. Her majesty's diplomatic corps includes only five ambassadors in the more restricted sense of the word, who are accredited to the courts of Vienna, Paris, St. Petersburg, Constantinople, and Berlin respectively. Inferior diplomatic agents receive the title of *chargé d'affaires*, minister plenipotentiary, or envoy (q.v.).

**AMBA'TO**, or ASIENTO D'AMBATO, a t. of Ecuador, on the north-eastern slope of Chimborazo, 66 m. s. from Quito, 8859 ft. above the sea. It was destroyed in 1698 by an eruption of Cotopaxi, but was soon rebuilt, and became more flourishing than before. It carries on an active trade in grain, sugar, and cochineal, the products of the surrounding country. Pop. 12,000.

**AMBER**, a substance analogous to the vegetable resins, and, in all probability, derived from an extinct coniferous tree, although now appearing, like coal, in connection with beds of which it is usually found, as a product of the mineral kingdom. It is usually of a pale-yellow color, sometimes reddish or brownish, is sometimes transparent, sometimes almost opaque. It occurs in round irregular lumps, grains, or drops; has a perfectly conchoidal fracture, is slightly brittle, emits an agreeable odor when rubbed, melts at 550° F., and burns with a bright flame and pleasant smell. It becomes negatively electric by friction, and possesses this property in a high degree—which, indeed, was first observed in it, and the term electricity is derived from *elektron*, the Greek name of A. The specific gravity of A. is 1.0–1.1. It is ultimately composed of carbon 79, hydrogen 10.05, and oxygen 10.5. An acid called succinic acid (named from the Lat.

*succinum*, amber) is obtained from it. A. had formerly a high reputation as a medicine, but the virtues ascribed to it were almost entirely imaginary. An antispasmodic volatile oil is obtained from it by distillation. A. is employed in the arts for the manufacture of many ornamental articles, and for the preparation of a kind of varnish. Great quantities are consumed in Mohammedan worship at Mecca, and it is in great demand throughout the east. It was obtained by the ancients from the coasts of the Baltic sea, where it is still found, especially between Königsberg and Memel, in greater abundance than anywhere else in the world. It is there partly cast up by the sea, partly obtained by means of nets, and partly dug out of a bed of bituminous wood. It is found elsewhere also in coal, and occasionally in diluvial deposits, as in the gravel near London; but it is very rare in Britain. It is obtained in small quantities from the coasts of Sicily and the Adriatic, and is found in different parts of Europe, in Siberia, Greenland, etc. It sometimes incloses insects of species which no longer exist. Leaves have also been found inclosed in it. Specimens which contain insects or leaves being much valued, fictitious ones are often manufactured and imposed upon collectors. According to an ancient fable, A. is the tears of the sisters of Phaëthon, who, after his death, were changed into poplars. The ancients set an immense value upon it. Pieces of A. have occasionally been found of 12 or 13 lbs. weight, but such pieces are extremely rare.

**AM'BER**, a decayed city in the Rajpoot state of Jeypoor, India, 4 m. n. by e. from Jeypoor, in 26° 59' n. lat., and 75° 58' e. long. It is situated on the margin of a small lake, in a deep hollow among hills; and its temples, houses, and streets are scattered among numerous ravines opening on the lake. Comparatively few of its houses are now inhabited; but everywhere are to be seen ghastly Hindu ascetics, sitting amidst the tombs and ruined houses. On the slope of an adjacent hill is the vast and gorgeous palace of A., a building remarkable for its massiveness and solidity.

**AM'BERG**, the old capital of the upper Palatinate in Bavaria, 35 m. e. of Nürnberg, and 32 n. of Ratisbon. It is situated on both sides of the Vilz, and is well built. Pop. 75,13,382. The ancient walls are now transformed into shady avenues. A. is the seat of the court of appeal for the district, possesses a library of 34,000 volumes, a lyceum, an agricultural and industrial school, a house of correction, an arsenal, etc. The principal products are fire-arms, earthenware, woollen cloths, ironmongery, and beer. A. has 14 breweries, a large cattle and swine market, a market for hops, and an important salt-trade. Many of the inhabitants are employed as miners in the neighboring mountains. The suburbs are adorned with beautiful gardens and shaded alleys.

**AMBERGRIS** (i.e., gray amber), a fatty substance, of an ash-gray color, with yellow or reddish striae, like those of marble, which is found in lumps of from  $\frac{1}{2}$  oz. in weight to 100 lbs. and upwards, floating on the sea, or cast upon the sea-shore in different parts of the world, and is also taken by whale-fishers from the bowels of the spermaceti whale (*Physeter macrocephalus*). Much A. is obtained from the coasts of the Bahama islands; it is also brought from different parts of the E. Indies, and the coasts of Africa and Brazil. It is probable that all of it is produced by the spermaceti whale, and that it is a morbid secretion in the intestinal canal of that animal, derived from the bile. It is highly valued upon account of its agreeable smell, and is much used in perfumery. The price is about 20s. an ounce. It has been strongly recommended for medicinal uses, but is scarcely employed in Europe; although, in some parts of Asia and Africa, it is much used as a medicine, and also in cookery as a condiment. The specific gravity of A. is scarcely more than 0.9. It almost always contains black spots, which appear to be caused by the presence of beaks of the *Sepia octopodia*, the principal food of the spermaceti whale. It consists in great part (85 per cent) of a peculiar brilliant white crystalline substance called *Ambrein*, which is obtained from it by treating it with alcohol.

**AMBIORIX**, a Belgo-Gallic chief who fought against Julius Cæsar in the 1st c. B.C. By cunning and strategy he defeated one important Roman garrison, and massacred every man; but while on the march to another camp he encountered Cæsar himself, who easily defeated him, though A. with a few men escaped into the forests.

**AMBLETEUSE**, pop. about 700; a French seaport on the English channel, 5 m. n. of Boulogne, where James II. landed on his flight from England in 1689. The place is no longer prosperous. When Napoleon meditated the invasion of England in 1804, he undertook without success to improve the harbor. Near A. stands the granite column erected by Napoleon to the grand army of 1805.

**AMBLYOPSIS**, a genus of blind fishes of which one species is found in the Mammoth cave, Kentucky. Eyes exist, but they are in a rudimentary state and under the epidermis. The A. is small, the largest no more than 5 in. long; body white and partly covered with scales; easily taken by a net or by the hand if perfect silence is observed, but they have most acute hearing. They feed on crayfish and other fishes. The nearest kindred are the minnow, pickerel, and herring.
